Before describing the furnace it may be well to say that these and all concentrating works are as nearly automatic as possible. The ore descends by gravity from cars through the crushers and other apparatus to the lowest level of the works and is carried from place to place by streams of water. Even the ashes from the roasting and smelting furnaces are continuously carried away by a current of water flowing through the ash bed and they are discharged at a long distance from the works without the intervention of any hand or tool.

There are two types of roasting furnaces in Anaconda. The Bruckner furnace is a cylinder some 20 feet in length by 10 feet in diameter, lined with brick, and revolving slowly. unroasted ore goes in at one end and is discharged at the other, while the gases from the burning sulphur go up the stack. Each furnace handles about 18,000 pounds of concentrates in a day, reducing the sulphur from 40 per cent. to 10 per cent., which is a most favorable proportion for subsequent operations. It takes about one ton of coal a day to fire each furnace, the coal available in Montana being much inferior to Eastern coal. It also takes the labor of two men per day of twenty-four hours to handle the material passing through one furnace. Another type employed at the Anaconda is the Wethy furnace, which consists of three or more horizontal shelves, one above the other: at the end of each shelf, but alternating in their position, are holes through which the ore can drop from the upper to the lower level. An endless chain carries a rake along the upper shelf dragging the burning ore toward the opening through which it drops to the second shelf. The chain comes out at the end of the furnace over a sprocket wheel, re-enters the second shelf, dragging the ore in the opposite direction, whence it falls to the third, then the chain still traveling onward over a second sprocket drags the same ore along the bottom shelf from which it drops into the car ready to receive it more or less prepared for the subsequent operations.

A third type of roasting furnace now successfully employed is the so-called Nichols furnace, the invention of Mr. Frank Herreshoff. These furnaces are circular instead of rectangular in section and have rakes revolving horizontally and not traveling from one shelf to another.

The next step is the matting of the roasted ore. It is fed into an upright furnace of the so-called cupola type, which is surrounded by a water jacket to keep it cool. Coke or limestone or other necessary fluxes are added and a blast of air introduced. Under the effect of the blast and of the heat evolved the ore melts. The impurities are largely slagged off, this slag carrying iron, silica, lime, etc. and the sulphide of copper is concentrated still further into a matte, which runs about 30 per cent. of copper, or can be brought up to 45 or 50 per cent., or even higher if advisable. At this point begins the bessemerizing of the copper, which is the most important of recent discoveries in the metallurgy of this metal. The well-known Bessemer furnace, which has been used for many years in converting iron into steel, is now universally employed for taking advantage of the oxygen of the air in removing the 30 to 40 per cent, of sulphur which the matte contains. The Bessemer furnace is of various kinds, being the ordinary pear-shape "converter" with which the steel industry

has made us familiar or a simple trough. In the bottom of the converter air tubes are introduced: the molten matte is run in from the furnace and the blast turned on; the sulphur combining with the oxygen is discharged as a gas, the remainder being brought up to a purity of from 96 to over 98 per cent. of copper. Of course this copper carries with it the gold and silver which were originally present in the ore. The converter is discharged when the reaction has ceased, and the copper produced is cast into pigs or converter bars as they are called. Of course there are many details not necessary to enter into at this time. For instance, the converters are lined with various mixtures in order that the substance of the lining may unite with some of the impurities in the copper that are not volatile, and, forming a slag, be easily carried off.

The next step at Anaconda and elsewhere where converter copper is produced, carrying precious metals, is the electrolytic separation of the metals.

The ores of Arizona and of the Southwest in general are of the carbonate or oxide type as far as the surface ores are concerned-remembering, of course, that only general terms are being used and that in every district as well as in every mine there are more or less of all types of ore. In Arizona there has never been any glacial erosion which has removed the oxidized ores with all the decomposed rocks of the surface in our Northeastern States and in many parts of the Rocky Mountain range. These oxidized ores always overlie sulphides where they have not been artificially removed. As a type of the carbonate and oxide mines of the Southwest the great Copper Queen is the most worthy of attention. This mine was opened in 1880 and a small furnace operated on its ores that year. To-day it has become one of the largest mines in the world with some twenty miles of shafts, tunnels, galleries and levels, and ore in sight capable of yielding 3,000,000 pounds of copper per month for years. The occurrence of the Copper Queen's and similar ores is in limestone and in this rock they are deposited in eccentric and curious ways. Bodies of ores are come upon without the slightest indication of warning, and equally without warning they suddenly disappear. From barren rock showing no trace of copper a drill will sometimes enter a cave of great extent, the sides and walls being magnificent with blue, red and green copper stalactites, and underneath are large bodies containing thousands of tons of rich ore. In the Copper Queen there are to-day cubes of ore blocked out on all sides that exceed 400 feet on the edge. Up to 1884 this mine produced 20,000,000 pounds of copper from a body of ore which was then exhausted. Almost by accident, after groping about in all directions for another ore body, a bonanza was discovered, from which mine they are still taking out millions of pounds of copper a month and with no indication of immediate exhaustion. The surface ores of these carbonate mines could be smelted without any bessemerizing or roasting, producing in the furnace by one operation black copper equivalent to the converter bars and suitable for the electrolytic separation, but, with depth, sulphides came in, and now the Copper Queen also is bessemerizing mattes and producing converter bars which come East for their electrolytic refining. The metallurgical works of the Copper Queen are most thoroughly modern in every respect. They use the trough converters, previously mentioned, holding about 30 cwt. of matte which assays about 33 per cent. of copper. These converters are 8 feet long by 6 feet in diameter.

As has been intimated, the final stage of copper refining is the electrolytic. The lecturer stated that it was not his purpose to go into the detail description of this process before a society of electrical engineers, many of whom had been actively engaged in the electrolytic copper refining. But speaking in general he stated that up to last year all the electrolytic establishments of the country could in a sense be considered experimental, but that works erected in 1899 were probably the most perfect that could be devised for some years to come. The lecturer deplored the extreme jealousy and consequent secrecy which existed in some works, preventing the men in charge exchanging with one another improvements and variations in method for the common good of all. He stated that in the application of this process, as he had observed it in visiting various works, the differences were comparatively slight. Some used wooden vats and some slate, some prefer the arrangement in series, some in multiple arc. Some companies thought best to increase capacity by enlarging the number of tanks, thus adding to their permanent investment, others increased their permanent expense by increasing the power in a fewer number of tanks. He stated that the chief difficulty was the maintenance of a constant current density, and quoted Dr. Keller's statement that he did not believe that a current density of over 18 amperes had ever been successfully exceeded for any length of time in the United States, and that the average density did not exceed 12 to 15 amperes per square foot. He discussed briefly the relative merits of the Havden and other systems employed at different works, stating that the chief difference was in the form of the anode. In most works operating under Hayden's patent the anodes were rolled into sheets, although in one of the works in England they had successfully cast their anodes into plates not over one-quarter inch thick. He spoke of different methods of hanging the anode which were practised, stating that the Hayden system economized space as the anodes could be set more closely, thus admitting also of greater current density and a more rapid turning over of the copper, the result being to decrease the amount of metal tied up in the tanks.

The cost of the electrolytic operation at Anaconda has been published, and is stated to be three-fourths of a cent per pound of copper. In Eastern refineries, however, contracts have been made by which the refiner agrees to return to the miner all the copper, gold and silver, the assay certificates call for in the form of refined copper, gold and silver, and charges for their services in some cases are so much less than one cent per pound that it is evident that it does not cost the Eastern refiner as much as three-fourths of a cent, even including interest on money tied up in the metals in the vats.

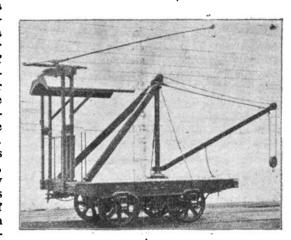

The lecture was illustrated with lantern views of Western mines, both surface and underground, views of traction, timbering, etc., also views of metallurgical mills and equip-

The day of opening of the Paris Exposition has been changed from Sunday, April 15, to Saturday, April 14, out of deference to the wishes of English and American exhibitors.

#### AN ELECTRIC LOCOMOTIVE AND CRANE COMBINED.\*

The use of electricity in manufacturing establishments is becoming more extended day by day. Its convenience in the transmission of power is a reason for its introduction, and wherever it is employed new uses are constantly suggested. For handling freight upon the railway tracks, which are in almost universal use in manufacturing establishments, it has been unusually satisfactory. The electric locomotive, while slow to make its appearance on the railroads of the country, is finding an immense field for itself on the "industrial" railways of manufacturing establishments. In this field it has already developed a greater variety of forms than the smaller steam locomotive. One of the great advantages of the electric locomotive is the flexibility of its design, and modifications are easily made. The power is variable and a new electrical equipment and an addition of weight enables the power to be increased indefinitely, in fact, up to the limit of the rails in carrying weight. In purchasing, when the type is suitable the hauling power is a matter of detail. The simplicity, economy and convenience of the machine have insured their favor wherever they have been used

In the machine illustrated, the novel combi-

COMBINED ELECTRIC LOCOMOTIVE AND CRANE.

nation has been made of crane with an electric locomotive. In addition to all the advantages which the latter machine possesses, it has made others peculiar to itself, the combination being more effective than either machine alone. It is said to be peculiarly valuable wherever large weights exceeding the power of one or two men to handle have to be lifted and transported, being capable of loading and hauling cars wherever wanted.

The machine is expected to be found particularly valuable in and about railway shops and along lines of street railways. It cannot only haul heavy loads, but pick up such weights as frogs, switches, crossings, rails, and any otherheavy material with great facility. It can load them upon cars and then haul them to points where they are wanted, and unload them with equal ease. The locomotive crane takes rails from piles and shifts them with greater facility than a gang of men, and with less danger of accidents. This facility for handling heavy goods, unloading trucks and placing weights where they may be wanted reduces the number of laborers and makes a reduction in the payroll, which is not easily estimated. Three or four men, with a machine

<sup>\*</sup> From the "Railway Age," Chicago.

of this kind should be able to easily do the work usually performed by a gang of fifteen or twenty laborers.

The overhead railway in the shop has no counterpart in the yard, but the machine shown in the engraving gives all the advantages in the yard which the overhead hoist and trolley has in the shop, with the additional advantage that it is self-propelled, and since it can move wherever the tracks are laid it has some advantages over the traveling crane. It has a 5-foot wheel base with a 31 foot overhang at each end. Where it is not necessary to carry loads on the deck of the machine adhesion may be obtained by piling ballast in the form of castings or pig-iron upon the platform. Where so desired, the machine has pockets between the sills which are filled with scrapiron. The crane is of the ordinary type, with the improvement of a hollow mast made of 4inch wrought-iron pipe, and the rope descends through this mast to the winding drum beneath the deck. The gib is of iron, and is supported by a rod. The mast is held as usual by guys, and the trolley stand is placed at one end with the controller, brake, etc. Under it is fitted a short hood for the protection of the motorman. In the design shown the gib swings through about half a circle. Where the load is to be lifted at right angles, heavier ballasting and a stronger mast are necessary. In case of necessity the platform can be made longer, so as to use it for carrying freight, and if still greater extension is needed, double trucks may be employed. In the type illustrated by increasing the amount of ballast and using large motors more than 200 horse power can be readily made available. The builders, J. G. Brill Company, have recently made one of these machines for their own use, and it is said to have already demonstrated its usefulness in and about the works.

# Automobile Display at the Pan-American Exposition.

Thomas M. Moore, recently appointed chief of transportation and machinery exhibits at the Pan-American Exposition, to be held in Buffalo, May 1 to November 1, 1901, who is working on preliminary arrangements for these exhibits, makes the following statement:

"The preliminary and merely mechanical work was our first care when we issued a letter to prospective exhibitors. The letter was sent out to the automobile manufacturers. those who make the vehicles and those who own the motor systems especially designed for the propulsion of these vehicles, and to all others who have made a study of automobiles and could aid us in making the Pan-American display of such vehicles a pronounced success. Up to now, exhibitions of automobiles have been but tentative, for the art is in its formative state and is but now reaching a point where practical results can be shown. The Pan-American will be the first exposition able to avail itself of these results to the fullest extent, and show to the world these vehicles of transportation, which are destined to effect as radical a change as was brought about by the use of the bicycle. Our success so far has been gratifying and assures us of great success in this particular unit of our Exposition. Replies are reaching us from all directions, and while we in the letter referred to did not solicit exhibits, but asked only for 'suggestions as to a plan for display by evolutions, races, etc., nearly 75 per cent. of the responses inform us

of the desire to co-operate with us and of the determination to make the best possible exhibit. Our correspondents evince a cordial spirit, and, with hardly any exception, promise to do all in their power to aid us."

# THE ELECTRIC TRAVELING CRANE IN THE GERMAN SECTION OF THE PARIS EXPOSITION.

(Translated from "La Vie Scientifique" for Electricity.)

The first step is being taken on the Champ de Mars in Paris toward the erection of heavy electrical working machinery by the German department, and it presents an impressive picture of industrial power to strengthen her renown and in a measure to increase her industrial supremacy.

It is now well known that central stations are being erected on the Champ de Mars to supply the Exposition with electrical energy. One of these stations is situated just off La Bourdonnaise avenue, and its power will be utilized to build up the French section; the other one occupies a symmetrical position to the first station, in reference to an axial line drawn through the Champ de Mars, and will be drawn upon to supply the requirements of the foreign departments. In each division of Machinery Hall is a traveling crane to be used in the placing and erection of heavy machinery. French manufacturers furnished one of them, and the other comes from the Berlin establishment of Carl Flohr. It has been in operation for a long time, and will be employed for handling machinery in the Belgian, English and other sections. In this locality the large American companies will exhibit their principal machinery, consisting of dynamos, electric motors, lamps, air compressors, steam engines and such kindred apparatus in its multiplicity of de-

It is to be noted that the directors of the Exposition called on Germany for the transporting apparatus that is to play so important a part during the installation period, and they can be well assured that Germany will successfully meet the rigorous exigencies that are made more aggravating by strict specifications and more difficult by special local circumstances.

The German Commissioner awarded to the Flohr factory the construction of the crane in March, 1898, and the designs were immediately commenced, and none too soon, for there was no time to be lost. Their construction departments were kept very busy, and only a well organized condition of their works enabled them to satisfy their clients.

In spite of the difficulties due to a large order, and the many modifications thought necessary during the manufacture, the first machine set up in Machinery Hall was the single arch traveling crane. This crane is designed to raise a load of 25 tons to a height of 12½ meters; the width of the arch is 27 6-10 meters, which is the exact distance between the rails on which it travels. This was one of the primary conditions of construction to preserve the whole space between its vertical supports without obstruction.

The track is laid along the supporting pillars of the gallery, and consists of two Vignole rails laid side by side, leaving between them a space for the passage of the truck frames. These rails are supported on short wooden ties laid on longitudinal beams of rectangular section, made up of sheet-iron plates. The

trusses, the arch and the whole upper structure is lattice-work construction.

Up to a certain point the supports are double and branch out terminating in a platform, which rests on two strong bases, each carried by a pair of two axle trucks which travel along the rails. A double transverse footbridge binds together the spandrels of the arch, and each bridge is supported from the center of the arch by a set of connecting hangers.

An electric motor with bevel gear connections operates an endless screw which turns the axles of the trucks.

The mechanism of the traveling crane is controlled by an operator from a platform placed slightly above the floor, level with the first gallery. From this position he governs the motors of the lifting tackle by means of an electric controller, and also moves the crane along the track at a speed of half a meter per second with an expenditure of energy of 26 horse power.

To raise the maximum load at a speed of 4-100 meters per second, requires 36 horse power, while a displacement of 30-100 centimeters per second requires 8 horse power. Continuous current motors are used.

The total weight of the crane is approximately 70,000 kilograms, and the mechanical parts, including motors, etc., weigh 28,000 kilograms. Ten railway cars were required to transport the material used in the construction of this great structure.

## THE ARNOLD ELECTRIC POWER STA-TION COMPANY.

(From the Street Railway Review.)

The Arnold Electric Power Station Company of Chicago was organized in 1896 to make and sell the parts peculiar to the "Arnold System" of power station construction, and acting in this capacity it has supplied a number of plants with magnetic clutches, shafts, quills, box stands and couplings. Among these plants may be mentioned the Ft. Dodge Light & Power Company, Ft. Dodge, Ia.; Chicago Board of Trade; Englewood & Chicago Electric Railway Company (now Chicago Electric Traction Company); Land Title & Trust Building, Philadelphia; University of Michigan, Ann Arbor, and W. B. Conkey Co., Hammond, Ind.

Through natural development this company has gradually broadened the scope of its work until it is now in position to make a proposition for furnishing and erecting in place entire electrical properties, and it already has an enviable record along this line.

The Chicago & Milwaukee Electric Railway was designed and built complete, exclusive of track and rolling stock, by the Arnold Company. This is the first long distance electric road comprising a central steam station containing direct current generators for supplying one section of the line, and alternators generating current at high potential for transmission to a number of sub-stations, each equipped with a storage battery and rotary transformers and converters.

The entire power plant and building of the Imperial Electric Light, Heat & Power Company at St. Louis, Mo., was constructed by the Arnold Company. This plant is a large central station, using 500-volt generators working in parallel with a storage battery auxiliary. By dividing this battery into two parts a distribution system was devised which allowed the use of 235-volt incandescent lamps, are lamps and power motors off the same generators—a de-

cided departure from the central station practice. This system has been adopted for another large central station since the erection of the Imperial plant.

The Arnold Company was also given the contract for the complete light, heat and power plant erected in connection with the new railroad shops of the Chicago Great Western Railroad, at Oelwein, Ia. This contract comprised not only the heating and lighting of the shop buildings, covering many acres, from a central plant, but also the application of a large number of motors for various uses. This has been the first plant to adopt the Arnold magnetic clutch for line shaft work, though these clutches have been used for some time in connection with the three way couplings, which are a part of the Arnold System of power station construction.

Another notable installation recently completed is the isolated plant for the Garrett Building, Chicago, which is occupied by a large wholesale grocery establishment. This contract included a complete system of lighting and power wiring for 45 motors, a storage battery auxiliary with booster and switchboard, and three generators connected by means of the Arnold System to two high speed engines. The plant is remarkable for the small amount of space occupied.

The position of the Arnold Company is unique among contractors; it works out the solution of the engineering problems involved in an undertaking and submits a proposal for doing the work, with guarantees as to the efficiency. Being in no way connected with any manufacturing concerns it is perfectly free to buy and use any make of apparatus which seems best adapted for the purpose.

The advent into general electrical contracting work of this company, prepared as it is with an organization capable of handling the largest contracts and willing to guarantee the operation and the economy of a completed plant or installation, is a development which promises to bring about new methods in building extensive electric properties.

### THE FIRE ALARM TELEGRAPH.

In a lecture before the Franklin Institute in Philadelphia on March 27, Mr. Adam Bosch, referring to the fire alarm telegraph, among other things said:

"Public attention to this application of the telegraph was first called on June 3, 1845, by Dr. W. F. Channing, of Boston, only a year after the completion of the first telegraph line between Baltimore and Washington. He outlined his plan of a central office system to be connected with every engine house and fire bell of the city. In every station thus established a Morse register and key in connection with an alarm bell were to convey an appropriate signal to every other station on the circuit. If so desired, every alarm of fire might be made to pass through the central office before being communicated to the different stations, The agent or operator would therefore be enabled by depressing a single key to ring out an alarm simultaneously on every church bell in the city.

"It was not until 1847 that the first practical effort was made to carry out the ideas of Dr. Channing, but three years passed before an experimental system was installed in Boston, the first in the country. Much apparatus was constructed and discarded before the big tower

bells successfully rang out the numbers of the signal boxes according to the dot and dash code. The signal boxes gave no end of trouble before they could be depended on to transmit the alarms so that they could be understood under all conditions. Serious defects were constantly developing, but progress kept pace. The first city after Boston to adopt the fire alarm telegraph was Philadelphia, where it was introduced in 1855.

"The attention of J. N. Gamewell was first directed toward the problems of the fire alarm in this same year. In 1859 the firm of Gamewell & Co. obtained control of all patents relating to the fire alarm telegraph. They gathered men of inventive genius and great mechanical skill, three of whom especially distinguished themselves by inventions of the greatest merit, Edwin Rogers, James M. Gardiner and Moses G. Crane. The first system, as a result of their work, equipped with automatic signal boxes, was introduced in 1866.

"The modern central office fire alarm system still resembles in general plan that outlined by Dr. Channing fifty-five years ago, but in instruments and apparatus most wonderful improvements have been made. There is little difference in the apparatus of recently furnished or reconstructed central office systems, and a description of one will pretty well answer for all.

"In modern systems the Morse register has been replaced by the multiple-pen register, which has the merit of greater compactness and may accommodate both the signal and alarm circuits, with the advantage that as the records are printed in parallel lines on the same paper, their relative positions will indicate to a second the time elapsed between the reception of the signal from the box and its transmission to the engine houses.

"Manual transmitters of recent make are marvels of mechanical skill. The dials are all placed on the same shaft and with these morning dials any number up to 999, and by adding another dial, up to 9999, may be transmitted. The liability of error by the operator is reduced to a minimum, and with a single movement of the starting lever from one to four 'rounds' may be transmitted, without further detention from the manipulator.

"The best practice demands that there should be two separate circuits to communicate alarms from the central office to the engine houses. The combination or joker system as adopted by nearly all the larger cities provides an additional and independent method, and as use is made of the duplex principle, there is intercommunication between the central office and engine houses. When a certain number of engine companies are away from quarters other companies are assigned to take their places and cover the district in their absence. It is therefore important that the entire department should know immediately of their return to quarters. This the returning companies do by signaling to the central office, whence the signal is transmitted without delay to the entire department. Attached to each signal box circuit is a series of switches operated by a lever by means of which the local relay of the repeater may be instantly inserted into any box circuit from which an alarm is being received. and the alarm is received also on the instruments in the engine houses. Other switches are so devised that in an emergency the alarm may be transmitted instantly and automatically on the joker circuit without the aid of an operator."

## SOCIETY NEWS.

#### Chicago Electrical Association.

The title of the paper to be read by Prof. I. J. Macomber before the Chicago Electrical Association on April 6 has been changed to "Transformer Design." The subject as originally announced was "Laboratory Methods."

#### American Institute of Electrical Engineers.

The 141st meeting of the American Institute of Electrical Engineers, was held in New York March 28th. In the absence of President Kennelly, Manager C. P. Steinmetz presided.

A paper was presented by Mr. Joseph Sachs of Hartford on "The Evolution of Safe and Accurate Fuse Protective Devices." The discussion was participated in by Messrs. G. S. Dunn, L. W. Downes, W. C. Woodward, H. C. Wirt, W. J. Hammer, F. V. Henshaw, C. O. Mailloux, Fremont Wilson and C. P. Steinmetz.

Resolutions of respect to the memory of the late S. Dana Greene adopted by the council were read by the secretary.

At the meeting of the council in the afternoon the following associate members were elected: Arthur C. Babson, Max D. Baron, Francis O. Blackwell, J. Walter Esterline, Fred. Alan Fish, Carl F. Fog, Irwin John Macomber, Harry Bowman Marsh, John Motley Morehead, James D. Mortimer, Martin Henry Offinger, Samuel W. Rushmore, Aubrey Norman Shaw, Chas. C. Stutz.

Prof. F. W. Brady of Mesilla Park, N. M., was transferred to full membership.

The following nominees were selected by council for the anual election May 15th:

For President—Carl Hering.

For Vice-President—Gano S. Dunn, Arthur V. Abbott, W. L. R. Emmet.

For Managers—W. S. Barstow, Calvin W. Rice, C. T. Hutchinson, R. D. Mershon.

For Treasurer—G. A. Hamilton.

For Secretary-R. W. Pope.

Dr. M. I. Pupin was appointed a manager to serve during the unexpired term of the late S. Dana Greene.

# LEGAL NOTES.

A short time ago the American Electrical Novelty & Mfg. Company received a favorable judgment in the suit brought by it against the Acme Electric Lamp Company. The suit was brought in equity for the infringement of certain patents, one a design patent, No. 29,939, dated January 3, 1899, and the other patent, No. 617,592, dated January 10, 1899. The design patent covered a design for a portable lamp body and the other covered an electric device for the lamp. The case was submitted to the court without argument and upon examination of the record the court held that the design patent and claims 1 and 3 of the other patent appeared to be valid and to have been infringed. The plaintiff was therefore given a decree in its favor.

Judge Budd of the Superior Court of Stockton, Cal., has handed down a decision in the suit of the Stockton Gas & Electric Company against the county of San Joaquin to recover \$1,400 paid under protest on its franchise, upon which Assessor Ortman had placed a valuation of \$115,000. The decision in effect is that the franchise is assessable in the county, where the company is granted special privileges. The contention of the company was that the principal place of business of the corporation being in San Francisco the franchise was assessable there only. In San Francisco the franchise is assessed for but \$1,000.

#### CANADIAN NOTES.

(From our Ottawa Correspondent.)

Application will be made at the present session of the Manitoba Legislature for the incorporation of the Winnipeg, Selkirk and Lake Winnipeg Electric Railway. It is proposed to run this road through to Selkirk, and possibly to Lake Winnipeg.

The introduction of the bill in the Ontario Legislature to charter an elevated street railway system for Toronto is causing a little un-easiness among holders of Toronto Electric Railway stock. The company has been organized by local capitalists, and has a capital of

The Bracebridge and Trading Lake Railway bill has successfully passed the Ontario Legislature. The company proposes to build and operate an electric railway from Bracebridge to Baysville and Beaumaris.

Advices from Niagara Falls, Ont., state that tenders have been taken for rebuilding the power house of the Niagara Falls Park and River Railway. The Sutherland Construction Company proposes commencing work at an early date to convert the horse car railway of the townin to an electric system.

Messrs, Tuerk Bros, have made an application to the town of Berlin, Ont., for a site for a factory to manufacture gasoline engines and automobiles. It is their intention to erect three large buildings for that purpose.

The proposed works of the Nickel Steel Company, of Hamilton, Ont., will consist of four blast furnaces. There will be two open-hearth buildings about 800 feet long and 80 feet wide. Electric power will be used, the machinery being operated by means of rotary converters.

All of the Eddy Company's saw mill, wood working, match-making and paper manufacturing plants, in Ottawa, will, before the close of the present year, be operated by electricity. The power will be obtained from the Conroy Milling Company, whose several mills are situated about three miles above the Eddy establishments. Construction work is now being carried on, and it is expected that fully 8,000 horse-power will be supplied to the Eddy Com-

The Cataract Power Company of Hamilton, Ont., was empowered by the Ontario Legislature, in January, 1898, to develop electric power in the vicinity of the Welland canal. The company proceeded to construct hydraulic works at Decew's Falls, and to build a transmission line to Hamilton, and the company is now supplying power to various concerns in that city. Hon, J. M. Gibson, Attorney-Genthat city. Hon. J. M. Gibson, Attorney-Ge eral of Ontario, is president of the company.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended March 24:

Aberdeen, 6 cases, \$2,225; Amsterdam, 1 case, \$17; Antwerp, 113 cases, \$13,053; Argentine Republic, 307 cases, \$27,945; Australia, 267 cases, \$13,366; Berlin, 14 cases, \$32; Brazil, 27 cases, \$1,529; British West Indies, 19 cases, \$291; Brussels, 5 cases, \$86; Bucharest, 7 cases, \$75; Central America, 54 cases, \$939; Cuba, 109 cases, \$1,330; Ecuador, 15 cases, \$358; Glasgow, 15 cases, \$3,825; Gothenburg, 8 cases, \$1,717; Hamburg, 44 cases, \$1,525; Havre, 376 cases, \$25,521; Hull, 4 cases, \$2,000, Japan, 1 case, \$200; London, 176 cases, \$9,077: Malaga, 2 cases, \$68, Manchester, 7 cases, \$121; Mexico, 159 cases, \$7,878; Rome, 14 cases, \$121; Southampton, 11 cases, \$2,620; Vienna, 2 cases, \$40.

The following were the exports for the week ended March 31:

Antwerp, 79 cases, \$4,428; Argentine Repub-

lic, 1 case, \$187; Australia, 96 cases, \$6,445; Barcelona, 2 cases, \$34; Berlin, 2 cases, \$611 Brazil, 39 cases, \$1,961; Bremen, 7 cases, \$109; British East Indies, 34 cases, \$771; British Guiana, 35 cases, \$5,075; China, 1 case, \$61; Copenhagen, 3 cases, \$78; Ecuador, 5 cases, \$50; Havre, 20 cases, \$1,000; Japan, 11 cases. \$1,651; Lisbon, 81 cases, \$3,042: Liverpool, 284 cases, \$22,171; Mexico, 26 cases, \$884; Newfoundland, 2 cases, \$89; Peru, 26 cases, \$914; Siam, 13 cases, \$285; Southampton; 12 cases, \$1,769; Stockholm, 3 cases, \$130.

#### PERSONAL MENTION.

Mr. O. H. Kirk, of the Westinghouse Electric & Manu facturing Company, has gone to Kobe, Japan, where he will represent the company in the Far East—looking particularly after Corea, Siberia, China and the Philippines.

Mr. E. F. C. Young has been elected director of the Con solidated Traction Company of Jersey City, N. J., to succeed the late Bernard M. Shanley. Mr. Young has also been appointed president of the company.

Mr. Van Dusen Rickert of Pottsville, Pa., has been elected manager and secretary of the Edison Illuminating Company of that city, and secretary of the Anthracite Light. Heat & Power Company, a corporation merged with the Edison. He succeeds Thomas Haldeman, who has accepted the management of the Columbia (Pa.) Electric Company.

Mr. C. F. Stierly has resigned his position as superintendent of the Cumberland Electric Light & Power Company of Nashville, Tenn., to accept the position of chief engineer and superintendent of the power plant of the Syracuse, N.Y., Rapid Transit Company.

Mr. Harry Pierce, president of the Fitchburg (Mass.) & Suburban Street Railway, who has been active in bringing about the combine between the Worcester & Clinton, Clinton & Hudson, Leominster & Clinton and his own road, will, it is reported, have charge of the consolidated interests as superintendent.

Mr. J. Elv of the Georgia Electric Light Company of Atlanta. Ga., has been invited to deliver a lecture under the auspices of the Electrical Workers' Union in the near future on the subject of "Electricity and Practical Electrical Appli-

### INCORPORATIONS.

The Consumers' Light, Heat & Ice Company, Newport News, Va .- to manufacture electric light and power, ice refrigeration, etc. Capital stock, \$100,000. Incorporators: W. C. Stuart, R. W. Perkins, J. A. Hirschberg, E. Peyser, A E. G. Klor, L. A. Myers, L. B. Reynolds, H. J. Lewis and F. Read, all of Newport News.

The People's Light & Power Company, East Liverpool, O. -to supply electricity for light, heat and power. Capital stock, \$25,000. Incorporators: C. A. Smith, A. G. Mason, J. A. Flood, J. E. McDonald and W. L. Smith.

The Denver Gas & Electric Company, Denver, Col.—to sup ply light, etc. Capital stock, \$3,500,000. Incorporators: G. Treadway Thompson, of Denver, and others.

The Union Electric Company, San Jose, Cal. -to build, purchase and operate all kinds of electrical plants and machinery; also to construct telephone and telegraph lines and to operate tramways. Capital stock. \$300,000 Directors: W. L. Hood, Z. L. Cornwell, F. L. Emerson, E. J. Emerson and F. F. Britton.

The Utica Electric Company, San Francisco, Cal. to manufacture all kinds of electric plants. Capital stock, \$10,000. J. V. Eichbaum, F. H. Eichbaum, J. W. Wright, H. Brooks, B. B. Rosekars, all of San Francisco

The Slayton Electric Caster Company, Tecumseh, Mich to manufacture Slayton electric casters, insoles, etc. Capital stock, \$20,000. Incorporators: D. L. Whitenack, G. Merritt, C. A. Slayton and Cynthian Slayton, all of Tecumseh.

The Electric Engine & Power Company of New York, Phoenix, Ariz. Capital stock, \$60,000,000.

The Charleston Electrical Supply Company, Charleston, W. Va. Incorporators: Edwin Polsne E. C. Polsne and E. C. Marwin, of Charleston; A. A. Atkinson and C. W. Me-Daniel, of Athens, O.

The Spring Valley Gas & Electric Company, Spring Valley, N. Y. Capital stock, \$40,000. Directors: George M. Dunlop, John D. Dunlop, of Spring Valley, and H. L. Hunt, of New York City.

The Cape Nome Electric Light & Telephone Company, San Francisco, Cal. to sell electricity, electric lights and power. Capital stock, \$150,000. Incorporators: D. Rich, E. Folger, C. S. Benedict, E. Holland, all of San Francisco, and C. S. Rosener, of Nome, Alaska.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F. street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

# GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Arlington, Minn.—This village will erect a new electric light plant this summer.

Blanchard, Ia. - This town will erect an electric

Casper, Wyo.—An electric light plant will soon be built by this city.

Ceresco, Mich.—The Kalamazoo Valley Power Com-pany will erect an electric light plant at this place.

Cooper, Tex.—The city council has granted a franchise for the construction of an electric light plant.

Downsville, N. Y.—This town is to have electric light in the near future.

East Grand Forks, Minn.—This city expects to build an electric light plant this summer, and will soon take steps toward securing money, etc. Address J. T. Brandt.

Eastman, Ga.—This city has voted an issuance of \$15,000 in bonds for the construction of an electric light plant and water works.

Fairport, N. Y.—Chas. H. Howe, ex-president can be addressed in regard to an electric light plant that the village board contemplates erecting in the near future.

Georgetown, O -The citizens are agitating the question of erecting an electric light plant.

Hailey, Idaho.—The water power of the Wood River to be utilized to build an electric light plant here this spring.

Hillsboro, N. D -The Bismarck electric light plant is to be enlarged to double its present capacity

Howell, Mich.—This city will bond itself for \$15,000 for a municipal electric lighting plant.

Idaho Falls, Idaho.—This town proposes to issue bonds to build an electric light plant.

Laurens, S. C.—The owners of the Ware Shoals, 15 miles west of here, are considering a proposition for the erection of an electric light plant.

Marion, Ind.—Plans have been prepared for a new electric light plant in this city to cost \$100,000.

McGrawville, N. Y.—At the recent village election the proposition to light the streets by electricity was carried by a majority.

Newfane, N. Y.—The Lockport felt mill, located here, expects to put an electric lighting plant in their establishment.

New London, Wis.—Chicago promoters are trying to terest the people here in a plan for a new electric interest the light plant.

Odessa, Mo.—This town is negotiating for an electric light plant.

Osgood, Ind.—T in electric lights. -The town council has decided to put

Rockville Centre, N. Y .- It has been voted to approriate \$16,500 for increasing the electric light plant at this place.

Spencerville, O.—This town will issue \$16,000 in bonds for the erection of an electric light plant.

Stafford, Kan .- The citizens of this place are agitating the question of erecting an electric light plant.

Troy, Ill.—The citizens of this place are agitating the question of erecting an electric light plant. Wampsville, N. Y.-J. W. Warner is about to erect

an electric light plant.

Williamsburg, Va.—The authorities of William and Mary College of this place will use electric lights in the college buildings, and about the grounds, and also put ater plant for fire and general use.

Woodhull, Ill —The citizens are discussing the proposition of erecting an electric light plant.

#### STREET RAILWAYS.

Albany, N. Y.—C. W. Blakeslee & Sons of New Haven, Conn., have been awarded the contract for the building of a 35 mile third rail system between Hudson and this city. The work is to be finished by the middle of summer. The electricity will be generated by a water power plant at Stuyvesant, N. Y., and the road will run through Niversville, N. Y., where it will intersect with the Boston & Albany, and will be a powerful competitor for the big business done by the New York Central between Hudson and Albary.

Bucyrus, O.—The Ohio Central Traction Company has decided to extend the electric line from this place to Upper Sandusky by way of Nevada and from Galion to Crestline.

Columbus, O.—The Chillicothe, Mt. Sterling & Columbus Electric Bailroad Company recently filed an ordinance with the city clerk for a franchise over Rich, Town, Scioto, McDowell and Mound streets, Jackson pike and a part of the Scioto levee.

Durham, N. C.-Stock has been subscribed to a company with strong backing for the establishment of a trolley line between this place and Chapel Hill.

Hoquiam, Wash.—Rapid steps have been taken to the furthering of the project of building an electric

ar line to connect Aberdeen and this place, a distance of four miles.

Laurens, N. Y .- The Oneonta Electric road will be extended to this place, and used for the transportation of milk

Marshalltown, Ia.—C. C. St. Clair of this city, with capitalists of Columbus, O., is interested in the building of a new electric street railway from Allison to this city by way of Parkersburg, Grundy Center and

Medford Mass -The Roston Elevated Railroad Company has obtained the necessary charters from this city and Somerville, so the long expected electric road past Tufts College is at last assured.

Minneapolis, Minn.-It is rumored that Lake Minnetonka is to have an electric line connecting it with this

Nashville, Tenn.—The People's Electric Railway Company has been formed to build an electric line in this city and suburbs. The company proposes to construct about 48 miles of track.

Owosso, Mich.—A twenty year franchise has been granted to J. T. McCurdy giving him the right to acquire, construct, maintain and operate an electric railway within the limits of this city.

Philadelphia, Pa.—Capitalists of this city contemplate the building of an electric railway from Carbondale to Susquehanna, a distance of thirty miles.

Shelburne, Vt.—Gen. Robert Avery, vice-president of the Burlington & Hinesburg Railroad says that the South Burlington & Shelburne electric road will surely be built this season and that its construction will be begun as soon as possible.

Seattle, Wash.—The city council has granted a franchise to the Frink syndicate to build an electric railway from the intersection of Connecticut street to the City Park. W. H. Park is interested.

Toledo, O.—The Toledo & Michigan Railway Company has been incorporated to build an electric railway from this city to the Michigan State line, where it will connect with the Toledo & Monroe Railway Company's line now being built. Surveys have been made for the new company's line and construction will soon be started. H. E. King, W. H. Spalding and H. W. Lloyd are interested.

Whitehall, N. Y.—The village trustees have granted a franchise to the Whitehall & Granville electric rail-road, and the construction of the road will be begun at

#### COMPANY MATTERS.

Biddeford, Me.-The members of the Portland syndicate, which recently purchased a controlling interest in the Biddeford & Saco Electric Railroad have decided to enlarge and improve the electric railway plant.

Bridgeport, Conn.—A preject is afoot for uniting the trolley roads centering in this city, including the Shelton Street Kailroad line reaching to Ansonia, Derby and Shelton, so that they may deliver freight at a Bridgeport wharf for transportation to New York by a new freight steamboat line.

Butler, Mo.—It is stated that a company expects to build an electric light, ice and heating plant, and a Cleveland, O.—The National Carbon Company has

Cleveland, O.—The National Carbon Company has decided upon extensive improvements to the principal plant in this city.—It is probable that the Cleveland & Eastern and the Cleveland & Chagrin Falls electric railways will be consolidated this spring.—The Little Consolidated Street Railway Company, which operates electric and cable lines in this city, is making arrangements to change the motive power on the latter to electricity

Flushing, N. Y.—The New York and Queens Gas & Electric Company contemplates making extensive improvements to its plant in Lawrence street, and the board of directors has authorized the expenditure of \$31,000 for this purpose.

Granville, N. Y.—The Granville Electric Light & Power Company has decided to enlarge the power house, add an extra boiler, and put in another 300 horse power engine

Henderson, Ky.—The Henderson Street Railway Company will reorganize, and enlarge and improve its power plant adding new rolling stock, motors, etc.

Houghton, Mich.—The Peninsula Electric Light & Power Company has voted to increase its capital stock to \$390,000 to add to its equipment.

Milwaukee, Wis.-The Milwaukee Electric Railway

Milwaukee, Wis.—The Milwaukee Electric Railway & Light Company has placed an order through the Milwaukee Rice Machinery Company of this city for a large quantity of heavy machinery, for use in its construction and repair department.

New Castle, Del —Clarence T. King, of Philadelphia, secretary of the Wilmington & New Castle Electric Railway Company, has secured the contract for the lighting of this city for five years for thirty are lights of 2,000 candle power at \$68 each per year.

Pittshurg Pa.—The Allegheny Valley Railroad Com-

Pittsburg, Pa.—The Allegheny Valley Railroad Company will erect a power plant at 20th street and the Allegheny Valley Railroad in the 12th ward.

Reading, Pa.-The Metropolitan Electric Light Company contemplates a number of important improve-ments at its plant on South 7th street. Among these will be the installation of two 500-horse power boilers,

directly in the rear of the present power house, the introduction of new machinery, a place for storing coal, etc. These improvements will entail a large expenditure of money.

Schenectady, N. Y.-The Utica Electric Light & Power Company is about to bring power from Trenton Falls for manufacturing purposes.

Shamokin, Pa.—The Shamokin Heat, Light & Power Company has definitely decided to erect a large building for the accommodation of all the electrical machinery now in the several electric light stations in this city, and work on same is expected to be started soon.

Stamford, Conn.—The National Electric Company of this place has filed in the State Secretary's office a certificate of dissolution.

St. Louis, Mo.—The Imperial Electric Light, Heat & Power Company has increased its capital stock to \$1,500,000 to construct a large power plant. C. Boettcher is president.

Troy, N. Y.—The Ham Sand Box Company of this city has received a large order for sand boxes from the Electric Railway & Tramway Carriage Works of Preston, England.—The plant of the Ballston Spa Light & Power Company, comprising an electric station and gas works, has lately been sold to the Hudson River Power & Transmission Company.

#### MANUFACTURING.

Cleveland, O.—Electric specialties are manufactured by a new firm in this city, designated as the American Electric Company.

Indianapolis, Ind .- The Wilson Manufacturing Company of St. Louis will remove to this city. The plant is large and manufactures bells of every descrip-tion. The Chenowith Light & Power Company will furnish the buildings, power, light, heat and water.

furnish the buildings, power, light, heat and water.

Menomonie, Wis.—The Submerged Electric Motor
Company has been organized in this city. This company is the owner of the Submerged Electric motor, a
recent invention of I. N. Smith of Minneapolis and
Tracy B. Hatch of Chicago. This device is not only an
invention, but also a discovery, and offers the first
solution of the problem of successfully operating an
electric motor under water, and will be manufactured
by the company. by the company.

by the company.

New York.—It is reported that some of the electric light companies in the larger Eastern cities have a new scheme they are going to try this summer. During the months when fewer lights are used the electric plants will be employed in the manufacture of ice.—The Baldwin & Rowland Switch Company of this city is about to begin the manufacture of electric switches.

Trenton, N. J.—A company has been formed here with a capital of \$3 500,000, known as the Hanscom & Hough Storage Battery Company, for the purpose of manufacturing electric motors, batteries and dynamos.

manufacturing electric motors, batteries and dynamos. Westerly, R. I.—The Jackson & Sharp Company has recently constructed three double decker trolley cars for the Syracuse, Lakeside and Baldwinsville Railway Company, on the plan of the regular summer cars with rows of seats on the top of the car. The company also has a number of trolley cars about completed for the Rochester and Sodus Bay Railway Company and the Sanford and Cape Porpoise Railway Company. A number of double decker closed trolley cars for a Paris company are now in process of construction. company are now in process of construction.

# POWER AND TRANSMISSION PLANTS.

San Andreas, Cal.—The Standard Electric Company has a force of 400 men at work at Whites Bar, on the Mokelumne River, where the new power plant of that company will be located. This is the largest electrical scheme in the State at present. The power will be transmitted hence to San Francisco by way of Stockton and Niles and the Santa Clara Valley towns.

Winsted, Conn.—The Winsted Gas Company has purchased of the heirs of Joseph Gould the water privileges and about 20 acres of land along what is known as Sandy Brook in Robertsville. This practically completes the purchase of various water privileges which the company has had in view for several months with the idea of establishing a large electrical power plant in Robertsville. in Robertsville.

#### MINES.

Penn, Pa.—The work on repairing and rehabilitating the mines at this place is going on daily. The works, both inside and out, so far as possible, will be run by electricity and consequently a large electric plant will be erected at this point.

#### AUTOMOBILES.

Hartford City, Ind.—Local and Omaha capitalists are backing an enterprise and propose to locate an automobile factory in this city. The free site and free fuel proposition by the city is an inducement and a large building will be elected at once.

Kokomo, Ind.—The delegates to the State Convention of the Travelers' Protective Association to be held at Terre Haute, April 20, from this city will make the journey from here in automobiles furnished by the Haynes & Appery factory.

# THE TELEPHONE WORLD.

# Meeting of Bell Telephone Company Stockholders.

At the annual meeting of the American Bell Telephone Company held in Boston on March 27, the recommendation of the directors that the property of the company be transferred to the American Telephone & Telegraph Company was approved. The stockholders also ratified the proposed exchange of shares of the company for those of the American Telephone & Telegraph Company at the rate of one share of Bell Company for two of those of the American Telephone & Telegraph Company. The retiring board was re-elected.

Before taking the vote President Hudson said that the only assets of the American Bell Telephone Company were its stock, and that its indebtedness consisted of \$10,000,000 outstanding bonds. It was thought desirable to allow this stock to remain in the hands of the Bell Company. This would be in the nature of a trust fund to be used in earing for the indebtedness when it matured. This would leave in the treasury approximately 520,000 shares of stock.

The annual report for the year ending on December 31 showed that the gross earnings from all sources amounted to \$5,760,105, an increase of \$311,407 over the gross earnings of 1898. The expenses aggregate \$1,687,154 an increase of \$632,422. The net earnings were \$4,072,451., a decrease of \$321,015.

The report continues as follows:

"The increase, in number of subscribers more than doubled that of any previous year. More than 115,000 miles of toll-line wire were added, the large proportion being of copper, and upward of 240,000 miles of exchange conductors more than half of which were placed underground.

"The new construction completed in 1839 by companies operating under Bell Telephone licenses amounted to \$24,056,822. In addition, \$2.066.311 was invested in real estate to be utilized for exchanges and company offices.

A dispatch from Dover, Del., to the N. Y. "Commercial" states that the dissatisfaction in various towns in Kent and Sussex counties, of Delaware, in reference to the "toll" system, which the Diamond State Telephone Company has ordered to be collected from renters and users of its phones has culminated in the proposal to organize a new telephone company for the better accommodation of the people in the two lower counties of Delaware. It developed in Dover recently that the organizing of a new company will be effected in a few days, as soon as a canvass is made among some prominent capitalists who favor the new move and a suffi-cient amount of money is subscribed to commence the work on the proposed line. The subscribers of the Diamond State Telephone are not allowed to talk out of the precincts of the town, not even a distance of three miles, without paying a toll of from 10 to 40 cents, in consequence of which a service is demanded to reach the entire length of the State, both north and south, without any increase over the amount charged for the yearly rental of the 'phone, which at present

One of the best indications of the material advancement of Kansas is the development of the telephone industry in that State. There has been no great stir about the movement, nothing has been said about a "boom," and yet the Kansas town of 1,500 inhabitants without a telephone exchange is the exception and not the rule. Within the past year or two dozens of Kansas towns have organized local companies, purchased their own instruments, and have established home exchanges. This is how it is accomplished: The people of a town feel the need of a telephone system; they organize a company among themselves and raise from \$1,500 to \$5,000 with which to build the plant: they operate it themselves and put the profits into extending the system; they wish to talk to the next town, and a toll line is built: that town in turn builds on to the next, and the result is that within a short time an extensive toll line system is in operation.

Charles H. Tuthill, of Washingtonville, N. Y., has been appointed general superintendent of the Highland, N. Y., Telephone Company, the concern that is preparing to construct a telephone system in Highland to connect with their other line, which will extend to nearly every village and city in, Orange County. The company has already over twenty miles of wire in operation, and expects to have the entire line in working order within the year.

Marion County, Kan., is being rapidly equipped with one of the best telephone systems in the central West. The Marion exchange already has 106 'phones, and the number is steadily increasing, while 84 'phones are now in use at Peabody. An exchange will be put in at Florence this spring, and the work of connecting all the smaller towns in the north and west portions of the county will be started at once.

 ${\bf A}$  company to construct and operate a telephone system in Clear Lake, S. D., is now organizing.

#### An Independent Association for Wisconsin.

At a meeting of independent telephone companies held at Weyauwega, Wis., on the 21st ult., it was decided to organize a State association and operate all the toll lines under one system. At the meeting 1,800 miles of toll line and 5,200 subscribers were represented. The following 16 companies are in the association: Rock County Telephone Company, Farron County Telephone Company, Jefferson Telephone Company, La Crosse & Southeastern Telephone Company, Monroe Telephone Company, Colma Telephone Company, Portage Telephone Company, Wood County Telephone Company, Marshfield Telephone Company, Wolf River Telephone Company, Dane County Telephone Company, Little Wolf River Telephone Company, The association is a combination against the American Company in the State of Wisconsin.

### A Farmers' Telephone Organization.

Fifty farmers of Clinton County, Ind., have organized a telephone company. Twenty miles of wire will be strung, connected with seventy-five homes. There will be no profit to the company, each member contributing annually for its support.

A unique plan has lately been projected, says the New Orleans "Picayune," for the establishment of a line of telephone wires extending out into the ocean from nearby points on the Atlantic coast, and so arranged that they can easily be found and used by navigators who are fog-bound or are otherwise prevented from making their way toward the harbor. The magnitude of such a scheme or the many advantages that it offers can only be fully appreciated by those whose experience has placed them in some such position as that which these wires are supposed to remedy. At certain seasons of the year fogs are of frequent occurrence along the Atlantic coast, and there is scarcely a time when they are not more or less in evidence.

Within the next few weeks plans will have been formulated whereby Frederick, Md., will be relieved of her network of overhead telephone wires. The Frederick County Telephone Company, which is a local corporation, has completed arrangements to install a new 500-drop switchboard for metallic circuits, and will commence work on its alterations this week, having secured quarters in the First National Bank Building. It will replace its wires in the city with coper wires, which will be run in cables to the edge of the city. The iron wires will all be taken down and used in the country to extend its lines in the northern section of the county, which is now practically without telephonic connections. Metallic circuits will be given to the subscribers instead of grounded ones, which render conversations much plainer and more satisfactory.

The Pittsburg & Allegheny Telephone Company will this month ask for a franchise in McKeesport, Pa. An ordinance will be presented in councils asking for right of way. It is said the company will offer to place its wires underground and fix a maximum rate of \$36 per year for telephones. It is said the company will also ask the right of way in Duquesne.

The Spottsylvania Telephone Company is rapidly extending its lines from Richmond, Va., towards Massaponax and it is thought that telephonic communication will be established between those two places and Fredericksburg and Sunlight this week.

The council of Bristol, Pa., has granted a franchise to the Central Telephone Company, recently incorporated under the laws of Delaware, and supposed to be a rival of the Bell system. The company purposes to build a long distance coast service from Washington to New York.

A San Francisco, Cal., daily states that the party line system of telephonic communication in that city will probably be done away with at an early date by the Pacific Telephone & Telegraph Company, owing to the general dissatisfaction of the public.

The Cumberland Telephone Company has made a reduction in their rates from Lynnville. Tenn., to Lewisburg, Columbia, Pulaski, Culleoka, Mt. Pleasant, Mooresville and to all the smaller places in Giles County. The patrons are said to be highly pleased with the change.

The Paterson, Passaic & Suburban Telephone Company has completed its trunk line connecting Clifton, Passaic and Garfield with Paterson, N. J. The trunk lines to North Paterson, Ridgewood and other points north are nearly completed.

It is reported that the Sunset Telephone Company will build a line connecting Lakeview, Ore., with Alturas, Cal.

#### To Test City's Rights.

The Iowa Telephone Company has thrown down the gauntlet, and a legal battle between that corporation and Iowa Falls, Ia., is on. For a year or more past the city and company have been at a variance as to the legal right of the company in the streets and alleys of the city The trouble is the outgrowth of the council seeking to tax the company or make it pay a rental for the use of the streets. The company has refused to meet any such demands upon it, and the council revoked the permit by which the company was first allowed to enter upon the rublic avenues of the corporation, leaving, as the city claims, the company without any legal right in the city. Efforts on the part of the company to set poles and string new lines have met with a refusal on the part of the city to permit any such extensions of the plant. Conferences and propositions have been made by both sides from time to time, but without arriving at any definite agreement. The upshot of the matter is that the company, through its attorney, has just served notice on the city that an injunction will be asked restraining the city from interfering with the company's extension of its lines in the city. By an agreement with City Solicitor Hutchinson, the matter will be argued before Judge Weaver and adjusted.

#### Telephones for Third Rail.

A telephone line for third-rail use has been placed in operation between Bristol and Hartford, Conn. At the terminals, New Britain and each of the passing sidings is located an instrument. Hereafter cars will wait on switches for passing cars unless released by a telephone order. The old plan of having cars proceed after a lapse of fize minutes has been abolished.

Telephone service has been promised by the Colorado Telephone Company to a number of small Colorado towns, and the first steps toward the establishment of through lines from Denver to these points have been taken. Two districts of Colorado will be given local service, including the towns of Silverton, Ouray and Delta, and the other including Sterling, Brush and Fort Morgan. As soon as material can be purchased the company will begin immediately to put in exchanges.

The Massachusetts Telephone & Telegraph Company has secured the rights of way from the Western Union Telegraph Company to run wires on its poles between Boston, Mass., and Portland. Me., for long-distance telephone service.

The Bell Telephone Company and the Enterprise Telephone Company are now engaged in making preparations to string wires through Sea Isle City, N. J.

It is rumored that negotiations are pending for the consolidation of the Cleveland and Cuyahoga telephone companies, the two corporations operating lines in Cleveland, O.

A bill was recently introduced into Congress authorizing the Postmaster-General to fix the rates on telephones used by the Government.

# TELEPHONE INCORPORATIONS.

The Phoebus Telephone Company, Phoebus, Va. Capital stock, \$10,000. Incorporators: A. M. Hanger, A. Heinckel, both of Phoebus; W. J. A. Cumming, J. V. Bickford, J. W. Lee, all of Hampton.

The Charleston & Sissonsville Telephone Company, Charleston, W. Va. Capital stock, \$1,200. Incorporators: Peter Silman, Edwin M. Keatley, Wyatt Mergan, J. H. Thompson, A. J. Spradling and P. S. Shirkey, all of Charleston.

The Regel Electric Company, Kittery, Me.—to manufacture telephone instruments and operate telephone lines, Capital stock, \$50,000. Incorporators: George B, Perkins and William Mitchell.

The American Multiplex Telephone, Telegraph & Cable Company of Massachusetts, incorporated at Dover, Del. Capital stock, \$1.000.000. Incorporators: George N. Phelps, Brookline, Mass.: Clinton E Dolbear, Hyde Park, Mass.; Martin E. Smith, Wilmington, Del.

The Farmers' Mutual Telephone Company, Cherry Flats, Pa. -to construct and operate telephone lines. Capital stock, \$5.000. Incorporators: T. J. Davies, E. C. Howell, E. D. Evans, E. C. Close, F. Peake and R. W. Bailey.

The West Alexandria Telephone Company of West Alexandria, O. Capital stock, \$3,000. Incorporators: J. E. Davis, W. H. Brubakes, G. W. Ehles, O. E. Dyer, J. Winkleman.

The Ozark Telephone Company, Cedar Rapids, Iowa. Capital stock. \$30,000. Incorporators: D. E. Howell, C. L. Konvalinka, J. T. Crimmins, all of Cedar Rapids.

## **ECTRICAL** ECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

## NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 161@161c.; Lake,163@171;;; casting, 16@161;.

The annual meeting of stockholders of the Electric Company of America will be held the latter part of this mouth.

There has been incorporated at  $Trenton,\,N,\,J$  , the Hanscom and Hough Storage Battery Company, with a capital of \$3.500,000

The Citizens' Traction Company, of Ohkosh, Wis., the capital of which is \$225-000, was recently sold to Emerson McMillin & Co. of New York.

The Maxican Telegraph Company has declared a quarterly dividend of 2½ per cent., payable April 16. Books close April 7 and reopen April 17.

The New York and New Jerrey Telephone Company has declared a quarterly dividend of 12 per cent., payable April 14 to stock of record April 5.

Tae new Eagland Telephone and T legraph Company has declared a dividend of \$1.50 per share, payable May 15. Books close April 6 and reopen May 8.

Tas Control and South American Telegraph Company has declared a quarterly dividend of 1½ per cent., payable April 9. Books closed March 31 and reopen April 10.

The annual meeting of the stockholders of the General Electric Company will be held at Schenectady, N. Y., Tuesday, May 8 at  $12\,\mathrm{M}$ . The transfer books will be closed at 12 o'clock April 14 and reopen at  $10~\mathrm{A}$ . M May 9.

It is reported that the Bridgeport (Conn.) Traction Company, operating 49 miles of track, is to be absorbed by the Connecticut Lighting & Power Company, which has acquired control of several street railways in the Naugatuck Valley.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 24 a 25; New York Electric Vehicle Trusportation, 104 all; New Eligiand Transportation, 64 ab 3; Felephole & Telegraph Company of America 48 all; Gramophone, 49 all 51.

A member of the General Electric Antomobile stockholders' committee says that no proposition for the financing of the company's affairs has as yet been prepared, and will not be until a considerable amount of stock has been deposited and the committee looks into the situation.

A certificate has been filed with the Secretary of S ate at Albany by the Patchouge E estric Light Company, setting forth that its capital stock has been increased from \$20,000 to \$40,000, consisting of shares of \$50 each. The company's directors include Edwin Bailey and George D. Gerard.

By action of the governing committee of the New York Stock Exchange on the 28th ult., absolute control of the telephone and telegraph wires running from the flor of the Exchange is given into the hands of the committee on arrangements. It is the purpose of the Exchange, in taking this step, to avoid as far as possible any direct communication between members and proscribed outsiders. It was intimated that this is the first step in the direction of various reforms.

The Tax Commission of Naw York State has fixed the value of the public franchises of the proceeds as the state of the process and lighting corporations of this city as follows: Brooklyn Rap d Transit System \$30.766 770; Manhattan Elevated, \$55 499, 300. Metropolitan Street Railway. \$62 068 93); Third Avenua System, \$19,728,100; Edison Electric of New York, \$9111,298. The value of all the franchises in New York City is placed at \$26,573,006.

At the regular meeting of the governors of the N Y. Stock Exchange on the 28th ult, the following securities were a lmitted to the training list: Commercial Cable Company—83 333,300 additional capital stock, making amount listed to date \$13 333 3 00. Matropolitan West Side Elevared Railway Company (of Chicago)—\$10,000,000 first mortgage 4 per cent forty year go d coupon bonds of 1938, \$9,000,000 5 per cent non-cumulative preferred stock and \$7,496,700 certificates of Central Trust Company of New York.

President didden of the Eric Telephone System is reported as saying that the investment in telephone properties in the United States is about the same as the investment in telegraph properties. In a substantisting statement the following figures are given: Telegraph investment, Western Union Telegraph Company, \$125,000,000; Pistal Telegraph Company, exclusive of cables, \$13,000,000; total \$138,000,000. Telephone investment, \$137,000,000, making a grand total investment in electrical communicating properties in the United States of \$275,000,000.

Judge Lacombe's order authorizing Receiver Grant to make contracts for power with the Matropolitan Street Railway Company and to complete the equipment of the Taird Azenue Railroad, says: "The work will require a considerable expenditure and the receiver appears to be without sufficient funds available for construction account. He is, therefore, authorized to borrow the money on ordinary receiver's notes. Should the recent change of ownership bring about a speedy termination of the receivership, they will be provided for with the other debts of the road."

The annual report of the American Bell Telephone Company, which covers operations for the calcudar year 1893, shows total carnings of \$5,76),106 as compared with \$5,448,701 in 1898. The total expenses were \$757,461; those of 1893 were \$615,885. The expenses included \$591,826, cost of operations. The net earnings were \$5,001.644, against \$4,802 \$18 in 1898, and the balance for 1899 in \$4,072 949, against \$4,393 966 in 1898. Extra dividends \$199,000 has been carried to the surplus account, raising the surplus figures to \$2,975,678. For 1899 the company earned 16 per cent, on the stock, against 17 per cent, in 1893 and 16 per cent, in 1897.

By a vote of 400,000 out of 504,000 shares, the lease of the Consolidated Traction Company of Pittsburg, Pa., was ratified at a meeting of the stockholders on Saturday. The minerity profested against the lease and the protest was entered on the minutes. The capital stock of the Consolidated Traction Company is \$3,000,000, of which \$15,000,000 is common and \$15,000,000 is preferred. Only \$9,600,000 of the preferred has been issued. The Union Traction Company will have a capital stock of \$3,000,000, 2) per cent. paid up, and the remainder of the stock assessable as required. C. L. Magee will be president of the company. The new company will also control the systems of the United Traction Company and the Monongahela S reet Railway Company, the only line outside of the combine being the West End Traction Company.

A certificate incorporating into one concern the principal gas and electric light and power companies in New Jersey was filed with the Secretary of State in Trenton on March 29. The companies merged by the certificate recently filed are the Newark Electric Light & Power Company, the Theoremsen-Houston Electric Company, of Newark, the Essex County Electric Company, the Suburban Electric Light & Power Company, the Montclair Light & Power Company, the Excelsion Electric Company of Harrison, the Kearney Electric Light & Power Company, the Hulson County Electric Company, the Jersey City Electric Light Company and the Newark Schuyler Electric Light Company. Of the \$20,000.000 capital authorized by the new certificate, \$5.50,000 has been issued or is outstanding. The president of the new gas and electric corporation is Philip N. Jackson, Dudley Farrand is vice-president, L. H. D. Gilmour is secretary and Percy Ingalls is treasurer. By this move the companies interested will save hundreds of dollars annually in taxes.

## EDITORIAL NOTES.

The Paris Exposition.

Before we go to press again the opening day of the Paris Exposition will have come and gone, and in view of this fact it

might be in place to outline in a general way the principal electrical and kindred features of this great World's Fair.

Some idea of the magnitude of this undertaking may be had when it is stated that the Exposition covers an area of 270 acres, the buildings and other features involving an expenditure of some \$25,000,000.

Of the various buildings devoted to the arts and sciences, that in which will be found the electrical exhibits will unquestionably attract much attention. From an artistic standpoint it is everything that could be desired, and as to size by far the largest so-called special palace on the grounds, covering as it does an area of 318,750 square feet. In it will be found the latest and most up-to-date electrical machinery and apparatus, as well as the principal electrical inventions of recent years. It is here in the basement that the energy for operating the thousands of electric lights throughout the Exposition will be generated, while on the ground floor will be in evidence electric heaters, electric cooking utensils, electrical signs, electrical toys, electro-plating apparatus, sections of ocean cables, switchboards of every description, and telephone and telegraph instruments.

There will also be a United States electrical retrospective exhibit, in which will be found many models of inventions by well-known American scientists, such as Benjamin Franklin's large machine for generating static electricity, an electro-magnet designed by Prof. Henry, and some of Morse's early telegraphy apparatus.

Visitors will also be afforded an opportunity of seeing a typical American machine shop in operation. This exhibit will be in an entirely separate building, 343 feet long and 77 feet wide, erected out of material manufactured on this side of the Atlantic. Here will be found in operation American machinery, with all modern appliances, including traveling cranes, hangers, shafting, electric motors, etc.

From an engineering point of view, perhapsone of the most novel features of the Exposition will be the movable platform operated by electricity, and described in detail in the issue of Electricity of February 22, 1899. This railway will be elevated, and will be wholly within the limits of the Exposition grounds. It will consist of two platforms. one running at a speed of about 2½ miles an hour, the other at a speed of about 5 miles. No more difficulty will be experienced in stepping from the low speed platform to the high speed walk, than there will be in stepping from the motionless stations to the low speed platform.

Another interesting feature of the Exposition will be the great telescope. This instrument, designed upon an entirely new plan, will, it is claimed, magnify 10,000 times, or in other words, is more than twice as powerful as any telescope heretofore brought out.

We are advised by a foreign correspondent that all the principal features of interest will be completed by the opening day and that the management of the Exposition is preparing to handle in safety the enormous crowds that are expected. The main gateway will be known as "L'Entrée Monumentale." The show will be open sixteen hours a day and this entrance is arranged to give passage to 60,000 persons an hour. This great gate is virtually a triumphal arch, decorated over its front with the arms of the city of Paris. It is surmounted by a Statue of Liberty. The gate, including two great friezes on its sides representing labor, cost in the neighborhood of \$13,000.

\* \* \*

Conservative England.

Some time ago we referred in these columns to the antipathy of the residents and merchants of

London, England, against the use of the telephone. This aversion was carried to such an extent that banking houses were said to look upon Prof. Bell's invention as something "not quite respectable," with the result that business was done by means of slow-going messengers. From all accounts this same spirit of conservatism would seem to exist in regard to electric light and power schemes, for in the case of a number of bills now before the House of Commons to incorporate electric power companies to furnish light, etc., opposition is being met with, on the ground that they are "a direct attack upon the rights, privileges and duties of municipal corporations," and that it "would practically set aside the existing law which adequately protects corporations in the exercise of duties which they have to perform." This hesitancy to grant privileges to private corporations, probably accounts in a great measure for the apparent backwardness of England, and more especially London, in the matter of electric lighting. The London "Times," referring to this subject in a recent issue, said:

"The principal streets of London are still lit with the glimmering gas lamps of fifty years ago. There is not a town, and hardly a self-respecting village in America, which is not bright with electric light. It is true there are three hundred electric lighting orders at present in force in this country, more than three-fourths of them in the hands of local authorities. But under the 236 orders issued to local authorities, according to a recent return, electricity was only being supplied in 81 cases. In 104 cases no steps whatever had been taken to carry the order into effect."

If the situation in London as regards lighting is as stated it scarcely compares favorably with that existing in New York City where the annual cost of lighting by electricity may roughly be estimated at about half a million dollars. Furthermore, as the above item states, it is difficult to find on this side of the Atlantic a reasonable sized town in the East or middle West that is not lighted by electricity, and it is by no means unusual to find villages of from four to five hundred inhabitants enjoying the advantages of incandescent lamps. That this is possible is owing to the fact that municipal ownership in this country is the exception and not the rule. A private corporation erects a plant and furnishes current for lighting and power purposes to small communities situated within a radius of say ten miles, which towns and villages would probably have to wait many years before they themselves would be in a position to erect municipal electric lighting plants. Thus does undue conservatism, as witnessed in the action of the British House of Commons on the private power companies' bills, tend to retard progress.

#### \* \* \*

Electricity as a Rain-Maker. We have several times referred in these columns to alleged discoveries made by Prof. Elmer Gates. Some

time ago mention was made of a method of drawing electricity from the sun's rays, said to have originated in Prof. Gates' laboratory at Chevy Chase, near Washington, and now it is reported by a correspondent named Watkins, of the Philadelphia "Dispatch," that Prof. Gates has discovered that electricity is indirectly the cause of rain. It is also asserted that means have been devised for causing—as yet on a small scale—artificial rain by a proper manipulation of the electric current.

Prof. Gates' theory is that if one locality or cloud becomes positively charged some adjacent locality or cloud must acquire a negative charge, or vice-versa. Midway between these two oppositely charged clouds or regions of moist air there must be one or more secondary regions where their respective particles commingle. Those of one being positive and those of the other being negative they attract, cohere and form rain drops. One region, according to the learned professor, may be a cloud or vapor-charged air mass and the other may be either another cloud or the earth. When disturbances of the so-called electric equilibrium of the atmosphere occur, differences in density, pressure, temperature and moisture result.

The above explanation as to the cause of

rain will probably come as a surprise to persons who have hitherto looked upon it as simply due to a condensation in the atmosphere of moist air.

In support of his theory Prof. Gates is said to have charged a current of moist air as it entered his laboratory through an open window with negative electricity and a similar current from another source with positive electricity. At a distance between the two inlets and where the two currents mingled a mist was seen to form. When asked by the writer of the article already referred to how a complete thunder-storm might be produced by such artifice. Prof. Gates replied that this was done by maintaining a layer of moist air in the top of a room and by charging this to a potential different from that of the floor below. If charged to a sufficiently high potential and with sufficient quickness there would result a sudden flash and discharge, accompanied by a fall of rain upon the floor.

If Prof. Gates' discovery ever extends beyond the laboratory we may expect to see in times of drought Immense static machines invoking rain for farmers by charging the breeze as it blows by either positively or negatively, in the same way that bombs are now occasionally projected into space in certain Western districts to please unsophisticated sons of the soil. And we are not sure but what the one process is as efficacious as will be the other.

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

The State Board of Railroad Commissioners will give hearings in this city on April 18 on petitions for authority to construct new street railroads. Among the petitions are: New York and Brooklyn Union Transportation Company, to construct an electric or compressed air road four miles long, from Manhattan to Brooklyn; New York, Brooklyn and Jersey City Rapid Transit Company, for a road six miles long, from New York to Brooklyn.

A NEW and improved faradmeter has been invented by Prof. Pupin of Columbia University. The instrument was placed on exhibition last week at the rooms of the American Society of Mechanical Engineers, 12 West Thirty-first street. Prof. Pupin, upon request, described the apparatus as follows: "The instrument measures the capacity of electric condensers and also of telephone cables and can be used by ordinary workmen who have no knowledge of electricity, and that, too, in any place. Its greatest efficiency is perhaps at manholes leading to underground conduits. It employs interrupted currents such as are used in electrotherapy, and in place of a galvanometer it substitutes a telephone. The method of balancing employed in such measurements is controlled by the sound in the telephone instead of the deflection of the galvanometer needle. A silence in the telephone indicates the correct balance. The reading on the instrument gives then the capacity which is measured. The instrument is very sensitive, is capable of a high degree of accuracy and it also offers the advantage of employing rapidly alternating currents, which avoids many sources of error which usually accompanied the old method."

It is stated on reliable authority, that a New York syndicate has purchased from the Province of Quebec power rights on the Saguenay River from the Grand Discharge to a point a little above Chicoutimi. There is no large fall on this part of the river, simply rapids: and it is understood that, in consideration of the large amount which will be expended for development, the price of the power is merely nominal. One million dollars is to be expended during the first year. The intention is to erect a pulp mill with an initial capacity of 90 tons.

It is stated that the work on the the cable between Emden, Germany, and New York, will begin on May 1. The German Government has given the company a sufficient guarantee to warrant the work, and the contract has been let to a London company. The cable will reach New York by August 1.

A NEW automatic electric safety block signal, which will stop a train without the assistance of the engineer or motorman, is now being introduced. It is applicable to any style of motor power.

SUPERINTENDENT O. T. HOLLOWAY, of the Railway Mail service in Cincinnati, recently issued an order authorizing the establishment of electric car mail service, and the transportation of the mails between Cincinnati, Newport, Covington, Ft. Thomas, Milldale, Dayton and Ludlow over the lines of the South Covington and Cincinnati Street Railway Company.

The Caracas Construction Company of New Jersey is transforming the present horse tramways of Caracas, Venezuela, into electric trolley lines. The company will also build an electric plant to supply the city with electric lamps. The power house will be constructed at Macuto, seven miles from Caracas.

News received from Altoona, Pa., states that the work on the electric lighting of the Gallitzin tunnel has been completed. Two hundred incandescent lamps, arranged along either side of the tunnel at a uniform distance apart, have been put in and furnish excellent illumination. A private plant has been established for the supply of the power for the lights. It is the purpose of the Pennsylvania Railroad Company to equip most of the large tunnels along their lines with electric lights. This has been done in a majority of cases, but there remain a few tunnels yet to be equipped.

SENATOR STEWART of Nevada has introduced a bill in the U.S. Senate authorizing the Secretary of War to grant a permit to the Commercial Cable Company of Cuba to lay and operate a cable between the United States and Cuba.

ALL manner of horseless vehicles will be tested in the automobile races which will be held in connection with the Paris Exposition. It is probable that the first competition will be in May between touring carriages, divided into classes according to the number of people they carry, Each will make five runs of a little less than 100 miles in a day, the speed to vary from fourteen to nineteen miles an hour. The prizes will be medals. Contests between delivery wagons and cabs will take place in June. They must run nineteen miles through Paris on five different days and carry at least 1,200 pounds of freight. Speed contests will take place in July under the rules of the Automobile Club of France. There will be five heats of nearly 250 miles each. There are nine cash prizes, the first being \$1,600 and the aggregate \$6,000,

ALFRED SKITT, general manager of the Manhattan Elevated Railway Company of New York City, has asked for an estimate of the cost of one hundred inclined elevators to be substituted for the stairways which now lead to the stations of the Manhattan road. Plans, specifications and an estimate of the cost of this improvement are now before the officials of the road. The estimated cost is about \$250,000. These proposed elevators will have a carrying capacity of 3,000 passengers each per hour. They will be run on the endless chain principle, and the power will be furnished by small electric motors placed in the stations.

A RESIDENT of Perry, Oklahoma Territory, who is an editor and an electrician, and who during the past year has conducted a series of experiments in wireless telegraphy, claims to have transmitted messages over a thousand miles. He asserts that when his system is perfected messages can be sent 25,000 miles as readily as 100 miles. However, he has given the public no idea of his methods, and until he does the scientific world will be inclined to look in a rather skeptical way on his claims.

Mr. Phelam McCullough, chief electrician of the Toronto Electric Railway, will leave shortly for Liverpool, Eng., to take the position of electrician to the Liverpool Street Railway, which is operated by the council of that city. The corporation has decided to install a complete electric system to replace the horse cars there. Mr. McCullough will superintend the installation

In a recent issue of "Centralblatt für Accumulatoren und Elementenkunde," Prof. Liebenow discusses the subject of dry secondary cells, and among other things gives it as his opinion that efforts to produce a practicalcell of this nature will never prove successful. The investigations into the action of secondary cells have shown that there are electrical concentration currents set up which tend to convey the acid in the pores of the plates from points of maximum to points of minimum concentration. These currents are necessary to equalize the strength of the acid, and effect this far more rapidly than would it be done by diffusion acting alone. When a gelatinous electrolyte, or a dry non-conducting powder is introduced between the plates, this equalization is prevented, and the cell is soon exhausted.

THERE is a rumor current to the effect that the New York Transportation Company, which is controlled by the Electric Vehicle Company, and which is now operating several electrically-propelled stages on Fifth avenue of this city, will in the near future place stages on some of the principal crosstown streets to connect with the different street railway lines.

A foundry about to be built at North Adams, Mass.—one of the largest in the country—will have a central alley 36 feet wide, which will be provided with a 10-ton electric traveling crane for the moving of heavy pieces. Every modern convenience will be introduced, and nothing will be spared to do the best work in the quickest time.

A CABLE dispatch from Havana, Cuba, to the N. Y. "Sun" states that the company controlling all of Havana's street railways commenced on April 4 to change the motive power from horses to electricity. In the outlying districts the work cannot be completed until the sewer and paving problem has been solved, but the streets on which the work is now being done are sufficiently wide to permit the laying of tracks on one side. The tracks will have to be torn up when the city is sewered and the company will stand the loss. The city is in great need of rapid transit. The company proposes to push the change as far as possible so as to be ready to jump in and finish the work when the general overhauling of the city takes place.

Some surprise having been expressed in England because the experiments with wireless telegraphy in South Africa did not produce better results, Signor Marconi has thought it necessary to explain to the Royal Institute why no better success could have been expected. Mr. Bullock and four assistants went to South Africa as representatives of Signor Marconi, and with instructions to use his system there. On their arrival at De Aar they were, according to Signor Marconi, much disappointed at finding that no steps had been taken to provide them with the material without which they could not set up their instruments. Major Baden-Powell came to their assistance, and, thanks to him, they procured masts and the other necessary material, which they set up themselves. In view of the fact that they were obliged to work hastily and to use any material that came to hand, it is not surprising, says Signor Marconi, that wireless telegraphy, under such conditions, was not a pronounced success.

The Electric Railway Company of Berlin, Germany, has placed in service an electrically-operated hearse, with compartments for mourners and friends. The charges for the use of this car are quite moderate, being about \$5. The object of the company in placing a funeral car in service is to lessen the cost of burials for the poorer classes.

THE second day's trial of the new battleship Kearsarge, which took place last week, proved everything that could be desired. All the electric motors were inspected, as well as winches, cranes, steam and hand-steering gear and fire system. The facilities for lowering a lifeboat under service conditions were tested, the turrets were turned through the full arc of train, 270 degrees, and the ammunition hoists and other minor accessories were inspected and tried. The trial of all the electric hoists, winches, etc., proved satisfactory, and the ammunition hoists for the 5-inch and the secondary guns of the "electric operated chain type" could hardly be improved upon, so it is claimed.

NEW ORLEANS, La., will in the near future, so it is stated, make use of wireless telegraphy in connection with its new fire-alarm system. Just how this will be done is not stated.

The London "Electrical Review" is authority for the statement that the increased output of carborundum in 1899 over 1898 is placed in the neighborhood of 50,000 lbs. Considering the active matter in which this industry has advanced, and the demand for the product, this is a substantial advance and demonstrates an increasing popularity of carborundum. The inside dimensions of the carborundum furnaces of to-day are 16 feet long, 6½ feet wide and 5 feet deep. The raw

material is piled 4 feet above the top of the furnace. One thousand electrical horse-power is applied to the furnace for 36 hours, during which time it is estimated that the furnace throws off no less than 7 tons of carbon monoxide gas.

At a meeting of the Municipal authorities of Vienna, Austria, on March 10, it was decided to place with the Schuckert Company of Nuremberg the contracts for the erection of electrical generating stations required for the Vienna electric light and traction schemes. It is proposed at present to install eight generating sets with an output of 3,000 hp. each, of which 15,000 hp. will be used for street railway purposes. The estimated value of the contracts is over \$6,250,000.

One of the greatest objections to the use of electrical driving in small shops comes in at the question of the steam hammer. A steam hammer is a necessity, and the proprietor cannot see that it costs him much more to drive his shop altogether by steam power so long as he must keep up steam for the hammer. In the Longworth hammer, according to a London contemporary, the motive power is derived from any mechanical source, and an electric motor may well be employed as the motive power. The difficulty with power hammers has been the regulation of the force of the blow. In the Longworth hammer this regulation is effected by means of a cushion of air rendered variable in volume under the piston in a controlling cylinder by means of a valve under the control of the attendant. There is a large field for electrically-driven hammers in many shops where the power is small, and steam is used only for a steam hammer. It is the want of such a hammer, or should we say, the small knowledge of its existence, that is one of the obstacles to be encountered by electrical transmission advocates.

ELECTRIC headlights of 5,000 candle power have been placed on the night cars of the Philadelphia & West Chester trolley.

The Automobile Club of London has issued a detailed programme of the motor-car trial which is to be held from April 23 to May 12. The course is from London to Edinburgh and return, and includes one day exhibits at Bristol, Birmingham, Manchester, Edinburgh, Newcastle-on-Tyne, Sheffield and Leeds, and shorter exhibitions at other places. A number of prizes will be given, and more than sixty vehicles of various classes are expected to compete,

According to the London "Financial Times." a company has been formed in Brussels, Belgium, with a capital of \$4,000,000 for the purpose of constructing an electric railway between Brussels and Antwerp. The Allgemeine Elektricitats-Gesellschaft of Berlin is said to be largely interested in the present scheme. The length of the proposed railway would be almost 28 miles, and it is expected that the distance between the two towns would be covered in 35 minutes without interruption. It is proposed that the railway should be connected up with the electric street railways in Brussels and Antwerp, and that the company should also undertake the working of these particular lines.

## ELECTRO-METALLURGY IN EUROPE IN 1800.

BY JOHN B. C. KERSHAW, London.

The year 1899 was not signalized by any striking discovery in the domain of electrometallurgy. Several of the older industries have, however, undergone considerable development, and one or two new processes have reached the stage of practical trial.

The progress in the various industries can be best dealt with under the heading of the various metals or compounds.

Aluminum.—The number of factories in operation in Europe for aluminum production is now five. These are situated at Foyers, St. Michel, Le Praz, Neuhausen and Rheinfelden.

The companies owning the works at Le Praz and at Neuhausen have raised fresh capital during 1899, but it is impossible to say what proportion of this will be devoted to the aluminum manufacture. The latter company is interested in power developments which are occurring at Lend-Gastein in Austria. The works at St. Michel passed into other hands during 1899, and it is probable that as a result of this transfer other manufactures may be carried on with the power available.

No reliable figures can be given for the output of the above five factories in 1899, owing to the refusal of those having the management to give any information on this subject for publication.

Two new aluminum factories are projected in Europe—at Lend-Gastein and at Almeria—both in Austria. It is improbable that these will be proceeded with, until the demand for the metal has greatly increased.

The Peniakoff process for producing aluminum from the sulphate received industrial trial at Selzaete in Belgium in 1899; but the writer has been unable to obtain any information concerning the results, and one can only surmise that these have not been promising.

With regard to the utilization of aluminum, its use as a substitute for copper for conducting purposes, has not progressed so rapidly in Europe as in America. This is to some extent due to the lack of long distance power transmission schemes. Aluminum is, however, receiving trial both in England and Germany, for telegraph and telephone purposes; and in the north of England it is about to be tried on an electric tramway as trolley wire.

Aluminum alloys are receiving considerable attention for many purposes. One of the largest English cycle companies now lists cycles built of an aluminum alloy, and in France an alloy called "partinium" is about to be used for constructing parts of the bodies of motor cars. Aluminum alloys were also used in many parts of the structure of the racing yacht Shamrock which contested the cup match in 1899.

For decorative metal work of all kinds, the use of aluminum is slowly extending, and the English Admiralty have now accepted it for internal work of this class on English war vessels.

The use of aluminum in place of stone for lithographic printing is rapidly increasing, and in Germany, where this method of color printing was first tried, it is stated that over 100 firms are now using it. The new metal has also been adopted by printing firms in England and France. The chief gain is in speed, as the aluminum plates can be used in rotary presses. A company with a capital of \$552,000 has been

formed for exploiting the new process in Europe.

The production of steel and copper plates coated with aluminum by the Wachnitz process is said to be extending in Germany, and such plates are being used for the manufacture of cooking vessels. The process consists in rolling the two plates under great pressure while at a red heat.

Bullion Refining.—There is nothing new to report concerning this industry, which though small is believed to be highly remunerative. The only two electrolytic bullion refineries known to the writer, are in Germany at Frankfort and at Hamburg. Details of these will be found in the issue of ELECTRICITY for May 11, 1898.

Calcium Carbide.—This industry has shown remarkable growth during 1899. The writer has estimated that at the close of the year there were 68 carbide factories in operation in Europe, and 16 in course of erection, a gain of 48 as compared with an estimate made at the commencement of the year. With a few exceptions all these factories are operated by waterpower, and in Italy especially considerable development is now occurring in the exploitation of water power for this and other manufactures. No reliable estimate of the carbide production in Europe during 1899 can be made; the total given by Kraft und Licht, namely 196,000 tons being certainly much too high. In France between 30,000 and 50,000 hp. is available for carbide production, but not onehalf this power is regularly utilized in the manufacture.

During 1899 several new carbide factories have commenced to produce, one at Iajce in Bosnia, and two at Sarpsfos in Norway being the most important. When completed the former will utilize 8,000 hp. and will be the largest carbide factory in Europe. At Sarpsfos the two factories (under different management) will utilize 4,500 hp.

Very full details of the cost of carbide at Meran in the Austrian Tyrol where 2,400 hp. is used in the Gin & Leleux type of furnace, have been published during 1899. Power at this spot costs only \$11.3 per EHP. year, and the total cost of carbide works out to \$34.8 per ton; of which one-fourth is debitted to electrical energy.

Triphase current is now being used for carbide manufacture in Europe with success—notably at St. Marcel in Italy, and at Langenthal in Switzerland. Experiments have also been made which prove that the grinding of the lime and coke is unnecessary and leads to much loss of these raw materials. At the Buda-Pesth Acetylene Congress and Exhibition, held in May, 1899, interesting papers bearing on the industry were read by Liebetanz, Ahrens, Caro, Guilbert, Lewes and others. A similar exhibition was held at Cannstadt in Germany later in the year.

Moissan, the noted French chemist, has been experimenting with carbide during 1899, and has discovered that pure calcium carbide is transparent and colorless. The opacity and dark color of the commercial product are due to the presence of iron.

With regard to the utilization of carbide, its use for acetylene generation is still the chief outlet. The use of powdered carbide as a germicide in the grape growing districts of southern Europe has not apparently been a success, and its use as the starting point for the manufacture of organic products has likewise not progressed beyond the laboratory. The Villon

process for production of ethyl alcohol from acetylene is said to be at work in Russia, but as it demands a supply of carbide at \$20 per ton, its development will not be rapid.

The use of acetylene as an illuminating agent appears to be progressing most rapidly in Germany, where at the commencement of 1899 there was said to be 170,000 acetylene burners in use. In that country acetylene mixed with oil-gas has been widely adopted by the railway authorities for carriage illumination, and this mixed gas is said to be giving every satisfaction. Its preparation is carried out under the Pintsch patents. In Germany several acetylene central supply stations have also been erected, and street lamps and private houses have been provided with a constant supply of the new illuminant. Similar central supply stations have also been erected at about six places in the United Kingdom, and a very large number of country houses have been provided with private acetylene installations, including generating plant. Considerable progress is also reported in southeastern Europe, where oil is the only rival illuminant, and both in Hungary and Greece central generating stations have been erected for the supply of small towns and villages.

Chromium and Tungsten.—The Goldschmidt-Vautin process for reducing the oxides of these metals by means of aluminum, has been worked upon an industrial scale in Germany during 1899. The works are at Essen, and an alloy of chromium and iron for use in the manufacture of chrome-steel is the chief product of the factory. A similar works is to be erected in France.

Copper.—The chief events of 1899 in connection with the refined copper industry have been those connected with the financial position. The price of G.M.B.'s on January 1, 1899, was \$276 per ton. In April the Amalgamated Copper Company was floated with a capital of \$75,000,000, and its operations have kept the price of copper considerably above \$336 per ton for the remainder of the year, the average price of G.M.B.'s for the twelve months having been \$349 per ton. European copper refiners have met with increasing difficulty in obtaining supplies of raw material for their electrolytic vats, and this difficulty has not been lessened by the policy, which since July, 1899, has been adopted by the syndicate, of buying up standard copper in Europe for reshipment to New York.

With regard to those refining processes which aim at the production of copper tubes or sheets the year 1899 has been marked by some changes. The various Elmore companies (with the exception of the French and German companies) have been amalgamated, and fresh capital has been put into the new company. It is hoped that these changes will lead to successful results, the French company which has not been hampered by lack of capital having been very successful. The Dumoulin process. which has now been operated for three years at Widnes, England, is not as successful financially as it was hoped it might be, and no dividend has yet been earned by the company owning this works. Cowper-Coles has patented a third process for the production of copper tubes by electro-deposition, and it is proposed to work it on an industrial scale. The validity of the patents is however challenged by Wilde, and it is possible that, if worked industrially, litigation may ensue.

Dr. Hoepfner has been experimenting many years upon an electrolytic process for extract-

ing copper from its ores. Writing in July, 1899, he informed the writer that this process was then operating industrially at Papenburg in Germany. So many attempts have been made without success to solve the problem of metal extraction by wet electrolytic methods, that further details of the Hoepfner process and trials at Papenburg, will be awaited with in-

Nickel.-Hoepfner has also worked out the details of a process for extracting nickel in a pure state from the new Caledonian ores, and a factory has been erected at a cost of \$240,000 for operation of this process at Papenburg. The plant was started in July, 1899, but no details are yet available concerning the process, or the results obtained.

Sodium.-During 1899 a second factory for the production of sodium by the Castner process was started at Rheinfelden. other factory using this process is situated at Oldbury near Birmingham. For details of this method see Electricity, February 2, 1898.

Zinc.—The Dieffenbach process for extracting zinc from pyrites cinders, which had been operated for several years at Duisburg in Germany, is reported to have been stopped. This is the more suprising as the process was understood to be financially successful. The experimental trials of the Cowper-Coles wet extraction process at Hayle in Cornwall have likewise ceased, and according to the inventor the process is to be operated industrially near London. No details of the new works have however been given to the public, and in view of the failure of the somewhat similar Ashcroft process it is doubtful whether the Cowper-Coles process would prove profitable.

The Swinburne process, which depends upon the electrolysis of a molten bath containing sulphide ore in a state of fusion, is still in its experimental stage, and no industrial trial of this process was made during 1899. The inventor is however still hopeful regarding the prospects of ultimate success. The difficulty of working out an economically successful process for dealing with mixed sulphide ores of the Broken Hill type, has been increased by the development of the Fry process. The process separates the zinc, lead and silver, by ordinary metallurgical treatment, and the large works built by the Smelting Corporation near Manchester, England, for operation of this process, are now working successfully. When complete 2,100 tons of ore per week will be handled at this works.

The Hoepfner zinc extraction process is the only electrolytic process which appears to be in successful industrial operation. It is worked in conjunction with the ammonia soda process, the waste chloride liquors being utilized in this way. Both zinc and chlorine compounds are obtained as products. It has been operated for some time at Winnington in England, and at Huschrau in Austria, and other plants for operation of this process are stated to be in course of erection in Italy, Belgium and France. The zinc works at Duisburg, where the Dieffenbach process was operated, are also said to have been taken over by financiers interested in the Hoepfner process.

There is nothing new to report during 1899, with regard to electro-galvanizing.

The Hamburg-American Steamship Company is said to have appropriated \$150,000 for nine electric cranes to be used in the construction of a new quay at Emden, Germany.

#### A MODERN ENGLISH LIGHTING PLANT

BY FRANK C. PERKINS.

It is interesting to note the great increase of American exports in the electrical industries in the last few years. Every manufacturer

British and German corporations with their largest installations. Among the more recent important foreign installations using American apparatus is that of the Metropolitan Electric Supply Company of London, shown in illustration, Fig. 1. Here it will be noticed are three

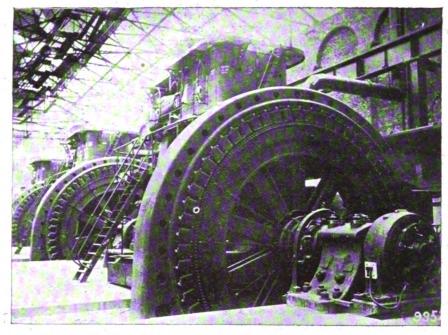

Fig. 1.—View of Three 1,500 K. W. Three-Phase Generators.

the home demand but is reaching out for the

is not only putting forth renewed effort to meet direct connected engines of the vertical compound type and three 1,500 kilowatt generators

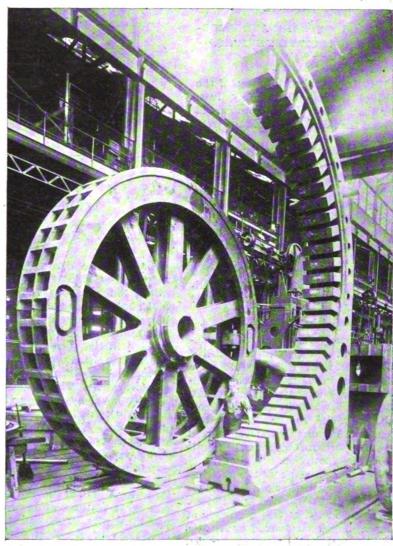

FIG. 2.—VIEW OF FIELD FRAME AND ARMATURE SPIDER.

many of our largest factories are supplying American make. Each alternator delivers 3,000

foreign markets for his products and already of the two phase type. This machinery is of

amperes at 500 volts and is driven at a speed of 130 revolutions per minute, the engines operating at 100 lbs. pressure. The high pressur cylinder is 36" in diameter and the stroke is three feet, while the low pressure cylinder is nearly five feet in diameter. The rated capacity of these engines is 2,500 hp. and the regulation is said to be within one per cent.

The cast iron field frame of the generator may be seen in Fig. 2. The field frame has 62 laminated soft steel pole pieces cast into the frame, which is constructed in two parts and bolted together securely. It will be noted that this construction allows the two halves of the field to be readily separated without disturbing the armature. The fields are carefully wound with insulated copper strips.

The armature spider is built of two castings bolted together and the massive steel rims are bolted to the arms, making a very solid construction. The armature conductors are embedded in slots on the armature ring and consist of heavy copper bars very heavily insulated. and fit snugly into the steel laminated punched cores which are fastened to the rims. These cores are built up to allow a free circulation of air, which holds the temperature at a point not exceeding 33 degrees above the surrounding atmosphere at full load and does not exceed this amount more than 15 degrees even at a heavy overload. Each alternator has its field excited by a 100 volt direct current supplied by a compound multipolar exciter, shown in Fig. 1, and is direct connected to the engine and alternator shaft.

## THE EVOLUTION OF SAFE AND ACCURATE FUSE PROTECTIVE DEVICES.\*

#### BY JOSEPH SACHS.

So much has been said and written of the shortcomings of the so-called safety fuse, that another discussion in this direction would certainly be but the raising of an old and well-known ghost.

With the object of producing a protective device which could lay claim to safety and accuracy in fact and not in name only, the writer began a series of experiments several years ago. As a result of these experiments, a new form of fuse protective device has been developed, which from extensive tests and various kinds of actual service has shown itself safe and accurate. This device is of the so-called enclosed fuse type which in several perfected forms has recently attained particular prominence, and which promises to be the cure-all of fuse difficulties.

Broadly speaking, the name "enclosed fuse" may be applied to any fuse-strip covered, encased or surrounded by a jacket, box or shell of some kind. Considered thus, probably the earliest device used in common practice fulfilling these conditions is the now famous Edison fuse plug, Fig. 1, whose tremendous success is unquestionably due to the facility with which it can be manipulated and the partial protection of the surroundings from the resulting effects of fuse disruption.

The value of such encasing of the fuse was fully appreciated even earlier than this, as is shown by a patent to Edison, Fig. 2, in 1880, which may be considered as the beginning of enclosed fuses. Fuses surrounded by asbestos wrappings, close-fitting rubber tubes, threaded through and placed between blocks of insu-

lating material, and placed in two-part blocks which formed practically a casing around the wire have followed. [See Figs. 3, 4 and 5.] For use on high potentials, a variety of fuse cutouts have been used in which the fuse wire is placed in a hollow handle or holder of insulating material and equipped with terminal pieces to which the fuse wire is removably connected, and so constructed that the arc resulting from the blowing of the fuse is more or less destroyed by various mechanical arrangements or blown-out by the rush of the air in the handle to the exterior, as shown in Fig. 6.

The name "enclosed" or "cartridge fuse" is, however, to-day particularly applied to fuses in which the fusible strip is placed inside of a tubular holding sheath or jacket which is filled with some yielding porous or similar material through which the fuse wire is threaded, and which more or less fills the space between the wire and inside of the tube. The wire, tube and filling are made one complete self-contained device with suitable terminals at its ends. Such jacketed and insulated fuses possess peculiar features. The jacket if properly designed gives to the very deficient fuse the essential accuracy and safety aside from various other desirable additions.

conditions governing the protection of electrical apparatus from excess current, the particular manner in which this new form of fuse protector fulfills these conditions, and the relative advantages of each of the two types.

GENERAL PRINCIPLES OF EXCESS CURRENT PROTECTION.

An abnormal current existing in an electrical appliance tends to cause injury and damage due to heat, sparking and mechanical and electrical strains and effects, either on the part of the electric apparatus itself or its driving or driven machinery. In the first two, the duration or time interval of the injurious effect enters into the resulting damage or injury as a direct function. The third effect may in some cases cause injurious results in so short a time interval that its action may be said to be almost instantaneous under certain extreme conditions of abnormal current flow.

All electrical apparatus is intended to, or should carry a normal load current without any injurious effects indefinitely, and it will carry an excess current for a time interval depending inversely on the amount of excess above the normal current before sufficient energy has been transformed to produce injury. Slight momentary rushes, or an excess current

Fig. 4.—Fuse in Center of Close Fitting Insulating Cylinder.

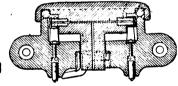

Fig. 5.—Fuse encased between, two Insulating Blocks.

Fig. 6.—Fuse in Centrally Vented Holder.

At the present time enclosed or cartridge fuses may be divided into two distinct types, both of which embody the same general elements, but differ in their disposition. In both, an enclosing tube entirely encases the fuse, and a filling material of the character named is placed in the tube around the wire. The difference in these two types simply consists in the composition and arrangement of the filling around the fuse. The simplest form is probably that in which the filling entirely surrounds the fuse wire, and completely fills the interior The other form involves the of the tube. arrangement of the filling material around the wire so as to leave a portion of the fuse uncovered thereby, and surrounded by an air-chamber usually located about centrally in the tubular casing. Both of these types inherently possess great features of advantage over an exposed fuse wire. Their operation under various conditions of electrical service is, however, generally governed by the same basic, electrical and thermal laws. The features inherent in each have received careful study and investigation, and this paper is intended to discuss the of short duration will not cause injury to the apparatus if the total energy developed is within the excess limit of the apparatus. Such changes in the current conditions occur, however, in a very large percentage of electrical apparatus and to open the circuit in these cases every time this occurs without taking cognizance of the time of its existence, is a fallacy unless governed by conditions other than the protection of the electrical apparatus from the abnormal current.

For the protection, therefore, of the electrical apparatus alone without regard to other conditions which may affect its operation, an excess current protective device fulfills every condition if it possesses the following features:

- 1. A definite, unchangeable maximum continuous running current-carrying capacity.
- 2. A constant definite energy overload capacity depending inversely on the overload, and adjusted with the allowance of a reasonable safety factor for the apparatus to be protected. In this respect the protective device should be like the apparatus protected, uninjured by an excess of momentary or shorter du-

<sup>\*</sup> Abstract of paper read at the 141st Meeting of the American Institute of Electrical Engineers, New York, March 28, 1900.

ration than the time interval causing injury. In other words, it should simply be a device whose factor of safety is less than the device to be protected, but whose operation is based on the same general principles. It must, therefore, operate practically instantaneously on short-circuit and in a time interval inversely dependent on the amount of ordinary overload.

3. Its operation should be safe under any condition of abnormal current at the voltage for which it is intended. No device can be universally safe in its self-contained form unless the arc and explosive effect coincident with the rupturing of the circuit under any condition is entirely suppressed. The device should not only prevent damage to extraneous surroundings but should be non-destructive to all connected parts other than those directly operative.

FEATURES OF THERMAL CUT-OUTS IN COMMON

Notwithstanding many statements to the contrary, no similar electrical device is based on simpler, or even as simple operating principles as the thermal cut-out, as it may properly be called. The generation of heat in any current-carrying conductor is a well understood phenomenon. The rise of temperature in this conductor, due to the heat energy imparted to it, is governed by well-known conditions. If these conditions could be made fixed instead of constantly varying quantities, accuracy and certainty of action would result.

The heat energy imparted to a section of conductor by a certain current flowing for definite time is a fixed quantity. The temperature attained in this conductor depends simply on how much of this heat energy is thrown from the conductor during that particular time interval. It is entirely obvious even without the various experimental investigations on this point, that any condition that varies the amount of heat energy taken from the conductor, varies the temperature attained, and hence the carrying-capacity of the conductor, since the melting of the metal is dependent thereon. The several ways in which this heat is dissipated from the ordinary air-exposed fuse conductor is entirely familiar to all electrical engineers but fuses always have been, and, are now, and in the case of open air fuses, probably always will be used indiscriminately without regard to these simple facts, and vet constancy and accuracy are expected.

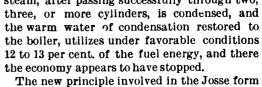

Perhaps even more serious, however, than accuracy is the lack of safety in the ordinary exposed fuse. On this score a multitude of transgressions are heaped up against fuse devices of such types as have been in use a dozen years on nearly all classes of high and low voltage services. No exposed fuse is safe, considered from the standpoint of fire hazard to its surroundings. The destructive and dangerous arcing of all exposed fuses when ruptured by excess current and particularly short-circuit conditions at the higher potential must be entirely and not partially eliminated before the fusible cut-out can be considered a perfectly satisfactory protective device. Even when a fire-proof housing is provided, safety is not absolutely assured. This serious objection to all open fuses is becoming more rather than less serious in its aspects in view of the introduction of higher potentials and enormous generating capacities.

Possessing inherently extreme structural simplicity, and involving an operative principle, not only due to the amount of current but also the time of its duration, the fusible cutout need only have added to it elements that will standardize the varying conditions which now beset it in service, and effectively eliminate the injurious arcing.

GENERAL FEATURES AND DESCRIPTION OF EN-CLOSED FUSES.

If the length of the fusible conductor is definitely fixed, the terminals properly proportioned so that the heat conduction from the fuse through them is correctly adjusted, and the fuse then protected from moving air currents and placed in an environment which cannot affect its action as to fusing, and which has a definite capacity for heat reception from the fusible strip, then some of the variable factors affecting the reliable action of the fusible conductor become fixed and the rise of temperature in the fusible strip for a certain current can be quite definitely relied upon.

Perhaps the very simplest arrangement embodying these elements comprises a definite length of insulating tubing entirely enclosing a fusible wire which is centrally fixed therein and surrounded throughout its length by the tube enclosed air, as shown in Fig. 7. Such an arrangement fixes the length, terminals and environment, but it still gives us only an air

of engine has made possible a return of power for fuel consumed which has heretofore been entirely impossible in steam engines. Already a large company has been formed in Berlin for exploiting the new principle and three of the largest electrical works in that city are expected soon to install engines of this type.

Fig. 7.—Air Filled Tube Fuse.

surrounded wire with the disadvantages of air surrounded fuse wire and by no means produces a device which will operate on severe conditions of abnormal current flow without serious explosive effect. It is true that such fuses in very small ampere capacities, inside of two or three amperes, and at low voltages can be made to work successfully without explosion, but even then the tube must be strong if it is desired to withstand severe short-circuit without disagreeable external manifestations.

A casing might be constructed of sufficient strength, to withstand the pressure of the interior explosion and by a slight leakage arrangement allow the confined gases to gradually escape, but the practical limitation would soon be reached with fairly large current capacities at moderate or high service voltages. Various tests have amply demonstrated this.

By a very simple addition, shown in Fig. 8, we can greatly improve the operation of the device as far as explosion and bursting of the tube is concerned. If the tube is entirely filled with some finely divided insulating material, such as powdered chalk, the heat due to disruption of the fuse wire, instead of giving rise to an abnormal pressure in the enclosing tube by the heating and expansion of the enclosed air, will be largely taken up by the filling. The small remaining volume of air in expanding passes through the interstices of the filling and parts with more or less of its heat that would otherwise give rise to a destructive pressure. Larger capacity fuses will require firmly held end closures and vents somewhere in the enclosing shell, so that gases may escape from the tube. While the arcing of the enclosed fuse has been cured, the results due to the holding of the metal in a molten condition by the oxide film have been aggravated instead of relieved. The firmly packed filling around the wire serves as a secure bed for the melted metal and its oxide film, relieving it of all supporting strain and maintaining it in continuity although entirely in a molted condition

(To be continued.)

#### UTILIZATION OF EXHAUST STEAM.

Considerable comment has been aroused in all parts of Germany by the surprising results attained by Prof. E. Josse of the Royal Technical High School, at Charlottenburg, with the use of exhaust steam for the generation of power.

It is, of course, well known that the ordinary simple high-pressure engine which, after passing steam through one cylinder, discharges it into the air, utilizes hardly more than 5 per cent. of the value of the fuel consumed under its boiler. The compound engine in which the steam, after passing successfully through two, three, or more cylinders, is condensed, and the warm water of condensation restored to the boiler, utilizes under favorable conditions 12 to 13 per cent. of the fuel energy, and there

Fig. 8.—Chalk Filled Solid Packed Fuse.

A complete and what appears to be an accurate non-technical description of the experimental engine employed at Charlottenburg has been transmitted to the State Department by United States Consul-General Frank H. Mason of Berlin. From this report it appears that the process is the joint discovery of Mr. G. Behrend, a Hamburg engineer, and Dr. Zimmerman, Ludwigshafen; and, although first patented in 1889, it has only recently been matured and its application perfected by the employment of an auxiliary engine, which, utilizing the heat contained in the exhaust steam, gains as high as 56 per cent. additional motive power without increasing the expenditure of fuel. The principle and process involved are simple and Mr. Mason describes them as follows:

It is plain that, with all progress which has hitherto been made in steam-engine practice through higher pressures, superheated steam, economical cut-offs, or successive cylinders, there is always an important and inevitable loss of heat energy when the steam, having done its work, is discharged into the open air or changed back to water by contact with cold water in a condenser. When the exhaust is into the open air, the steam has a temperature of about 100° Celsius (212° F.), when it passes into a condenser, the steam has a temperature of 60° to 70° Celsius (140° to 160° F.), according to the vacuum. The corresponding latent heat of steam, given up upon change of form from steam to hot water, has hitherto run to waste in the condensing or cooling water, or in the air. Messrs. Behrend and Zimmerman attacked the problem of utilizing this wasted caloric by employing it to create a new supply of steam by evaporating some liquid which has a lower boiling point than water, and for this purpose they chose, after many experiments sulphurous acid, which is not only cheap and easily obtained, but has the further advantage

<sup>\*</sup> From the "Manufacturer," Philadelphia.

of a viscous consistency and lubricates the inner working surfaces of the machinery without corroding them. Their demonstrations, although not practically conclusive, were so promising that Prof. Josse, as a technical authority on this subject, took up the problem, and, after several months of highly satisfactory laboratory experiment, caused to be constructed and connected with an ordinary working steam engine, of the compound type an additional condenser and auxiliary engine, the power of which could be exactly measured.

The engine employed in these experiments was an ordinary compound engine with a stroke of 500 millimeters (19.69 inches) and a speed of 41.5 revolutions per minute. In the engine as altered for the new process, the exhaust steam is made to pass from the low-pressure cylinder into a surface condenser, called the "vaporizer." In this vaporizer or condenser, the cooling medium used, instead of water, is liquid sulphurous acid, which has a boiling point so low that it is immediately decomposed by the heat of the exhaust steam, whereby the sulphur dioxide gas is liberated, which passes over into the cylinder of an auxiliary engine, where its work is done as in an ordinary steam engine. The auxiliary cylinder has a diameter of 300 millimeters (11.81 inches) and a stroke of 500 millimeters, with a speed of 77 revolutions per minute.

After passing through this cylinder, the sulphurous vapor enters the surface condenser, around the tubes of which cold water flows as in an ordinary steam plant. Here the sulphurous vapor is condensed to liquid and is forced by a pump back into the vaporizer, where it begins its cycle again, the same surphur dioxide being used over and over again indefinitely There are, therefore, in fact, two condensers, the first serving, as it were, as a boiler or steam generator for the auxiliary engine; and this boiler, instead of being fired by coal, obtains all its heat from the exhaust of an ordinary steam engine, and, instead of converting water into steam, evaporates a liquid which is much more volatile—i. e., has a far lower boiling point.

In the long series of recorded tests with the plant, the following results were attained:

The steam engine is of the compound type, of good, modern construction, and, being given a steady load, developed 34 indicated horse-power, with a consumption of 8.6 kilograms (18.96 pounds) of steam per indicated horse-power hour. The auxiliary machine working with the sulphurous vapor indicated 19 horse-power—that is, an increase of 56 per cent., and yielding, instead of 1 horse-power, 1.56 horse-power for the same steam consumption and reducing the steam consumption from 8.6 kilograms to 5.5 kilograms (from 18.95 to 12.13 pounds) per indicated horse-power.

The experiments showed on the average that for every 15 kilograms (33.169 pounds) of steam passing through the main engine, 1 horse-power could be gained in the auxiliary machine. Applied, therefore, to an ordinary single-cylinder steam engine, exhausting into the air at high temperature, the percentage of power saved by this new device would be very much higher than the economy reached in these experiments, which, as has been shown, were made with a highly-improved compound engine. From the average of these experiments, it may be broadly stated that, given a fairly economical compound engine, using 74 kilograms (16.5 pounds) of steam per indicated horsepower hour, half an indicated horse-power

could be produced in the auxiliary machine for every indicated horse-power developed in the main engine.

The expense of this improvement is practically all in the construction cost of the vaporizer, condenser, and auxiliary engine itself, and its economy may be realized from the fact that the exhaust steam from a 2,000 horse-power central station engine should furnish power to drive an additional 1,000 horse-power engine, which can be connected as an extra cylinder to the steam engine or run independently, and thus increase by 50 per cent. the power developed without adding a pound to the quantity of fuel consumed.

#### THE PARIS EXPOSITION.

#### Production of Electrical Energy.

(Special Correspondence of Electricity.)

The electric energy required for the many uses of the Exposition will be produced by condensing steam engines directly coupled by a common shaft to the generating dynamos, and to the exclusion of all transmission by means of pulleys, belts, etc.

The necessary steam for these engines will be supplied from two boiler houses, situated just in front of the former Machinery Hall. The Suffren boiler house contains boilers of foreign manufacture, while the Bourdonnaise will obtain whatever awards the international examining jury may consider their due.

Each generative set will be provided with a suitable switchboard and protective appliances, such as the administration of the Exposition requires. The electric current will be delivered at the switchboard under a definite and even tension as follows: Continuous current 240 to 480 volts at the main switchboard; simple alternating current, 2,200 volts, frequency 50; two-phase current, 2,200 volts, frequency 42.5; three-phase current, 2,200 3,000 and 5,000 volts, frequency 50 to 42.

The administration, assisted by the exhibitors' employes, will at once proceed to make tests to determine if the steam and electric generators are suitable for furnishing the normal power required for the different places. A record will be kept of these tests, and further tests may be made at any time during the Exposition.

There are 38 groups of electric generators, 19 of these belong to the French section, and a like number in the foreign section.

The total output of the 38 groups of generators, is 20,245 kilowatts.

The two following explanatory tables give the names of the groups to be found in the right and left hand galleries of the Electrical Building, in the two Machinery Halls, in front of the Banquet Hall, and on a part of the ground floor of the Electrical Building:

boiler house will contain boilers of French manufacture. The steam in the main conducting pipes, will have an effective pressure of ten kilograms per square centimeter. This pressure may vary by at least 10 per cent.

The generating sets for these purposes will be considered as exhibits, and governed by the same general rules as other exhibits, and they The 37 steam engines give a total of 36,035 indicated hp., to which we must add 120 hp. from Charon gas engines, which furnish power for the dynamos in group 17, and are especially installed to supply the requirements of the temporary sewer system.

The current distribution is as follows:

First—Continuous current, 19 groups, total

8,160 kw. Included in this total are the 750 kw. continuous current furnished by the dynamos, Nos. 26 and 28.

Second—Simple alternating current, 2 groups, total 1.270 kw.

Third—Two-phase current, 1 group of 480 kw.

Fourth—Three-phase current, 17 groups, total 10.335 kw.

Grand tetal, 20,245 kw.

A division of the generator groups by nationalities, give results as follows:

France	19	group	8	8,075	KW.
Germany	4			4,175	**
England	8	**		1,900	**
Belgium	3	**		1,740	**
Austria				1,410	**

Switzerland	3			950	**
Hungary	1	**	• • • • • • • • • • • • • • • • • • • •	670	• •
Netherlands	1	"		800	
Grand Total	. <b></b>			20,24	- 5 ··

All the electric energy produced by the above groups are devoted exclusively to furnishing electricity for general lighting, power, and freight and passenger elevators.

Power to be used for special lighting, special enterprises, and for restaurants, theaters, and other public places, will be furnished by the Compagnie du Secteur de la Rive Gauche, and by the Compagnie du Secteur de Champs Elysée, or by other private companies, to which is given the privilege of furnishing a maximum of 120 hp. for driving motors and which are included also subsidiary motors. Those which are running simultaneously must not exceed 60 hp.

The moving platform which is about 4,000 meters long, and encircles the Exposition grounds, and a parallel electric railroad, which will carry passengers in an opposite direction, will receive their electric power from an electric station of the Compagnie de l'Ouest, which has recently built a station at Moulineaux-Billancourt for its new line to the Invalids.

The primary three-phase alternating current of 3,000 volts, will end at a transformer substation, situated on the Quai d'Orsay, which contains two groups of rotary transformers of 600 kw. and two commutating machines of 600 kw. The tension of the continuous current, furnished by these last machines will be 500 to 550 volts.

The above is a resume of the means taken to furnish the Exposition with electric energy for the many diverse purposes.

## Plans for a National Highway.

At the first banquet of the Automobile Club of America, held last week at the Waldorf-Astoria in this city, the plan of a national highway from the Atlantic to the Pacific was formally launched and a definite route was annouced. The plan as read by Col. Pope, of Boston, provides for a highway along the Eastern coast from St. Augustine to Portland, Me., and on the Western coast from Los Angeles to Seattle. The main highway, however, will be from New York to San Francisco, passing through Chicago, St. Louis, Kansas City, Omaha and Ogden. Congress will be asked to appropriate one-third of the expense, the States through which the roads pass one-third, and the counties, townships and cities through which it goes the other third. Owners of property benefited will be asked to donate the right of way. The road is designed to be 120 feet in width and in a perfectly straight line.

#### Electric Floats.

The sixteen electric floats built in New Orleans, La., at a cost of \$42,000 have been sold to Denver for an exhibition there, and from Denver they will be sent to Wichita, Kan., for the next street fair to be held early in October.

They are the first and only electric floats ever built in the world and one of them named "The Era of Electricity," is said to be so dazzling that one cannot stand within fifty feet of it and look at it without injury to the eye. This float alone cost \$7,000.

These floats are built on car trucks provided with motors, which are operated the same as those on trolley cars by current taken from an overhead conductor.

On the occasion of the opening parade of the New Orleans carnival, February 21, the floats were all mounted on trucks and were driven by the overhead trolley system. While the feasibility of thus employing electricity for light and motive power in carnival parades has often been discussed, it was never before attempted. To the spectators the tableau moved along without any apparent motive force. The controller and brake were placed in the forward part and the trolley pole towards the rear. Each car was equipped with a controller and a switch to control the lights. It tested the ingenuity of the deviser to conceal the motorman and so disguise the trolley pole that it would not be recognized. It was a difficult piece of work especially on account of the radical difference of all the tableaux, but it was accomplished admirably. Due regard had to be exercised as well to give the men ample room to work in and to see ahead. Though each tableau had a cave in front and a larger one to the rear, the designer comprehended this so cleverly that its purpose was altogether lost in the general effect. In the case of Nereus, for instance, the motorman was concealed in the head of the fish, and a small and inconspicuous aperture gave him full opportunity to see ahead. The trolley pole was hidden by several sea gulls in flight. In the car showing the burning of the Templars the motorman was concealed in the flames, while the trolley pole was a huge tongue of flame which swayed to and fro.

#### A Telegraph Pole Climbing Contest.

During the recent military tournament, held in Madison Square Garden of this city, an ininteresting telegraph pole climbing contest took place between the First and Second Signal Corps of the National Guard of New York State. The prize consisted of a handsome silver loving-cup, made by Tiffany & Co., and bearing the inscription: "1900. Military Athletic League Signal Service Contest, Madison Square Garden, New York."

Six poles were furnished as nearly uniform as possible and erected rigidly in a vertical position. Each pole had a spike driven in one side at a point thirty feet from the base. The contest consisted in placing numbered cards on the spikes on the poles under the following terms and conditions previously agreed to:

"Each corps to be represented by a team of six enlisted men who have been members of their respective organizations at least two months and whose daily employment does not include pole-climbing. The contest to consist of three heats of three minutes each, the team winning two heats to be adjudged the winner of the contest and to be awarded the trophy.

"At the signal to start, the contestants to

take the numbered cards from a table, one at a time, and place them on the spikes on the poles of their respective teams, climbing the poles for the purpose and descending to the ground each time a card is so placed. At the signal to stop the team having the greater number of cards hanging from its spikes on the poles to be the winner of the heat."

Both, heats which occurred on March 27 and March 31 respectively, were won by the team representing the First Signal Corps, which in so doing demonstrated how rapidly work of stringing wires could be carried on in the field.

#### LONDON NOTES.

[From our London Correspondent.]

#### Gas-Driven Electric Plants a Failure.

The experience of Morecambe, Belfast and Coatbridge, which some years ago installed producer-gas driven electric lighting systems, which after a short time were found to be unsatisfactory, is now being repeated in two other more modern stations. We refer to Leyton, where a municipal plant has been operating for three or four years, and at Lynn in Norfolk, where the works only commenced running last autumn. The Leyton plant was described in Electricity at the time, and the Lynn equipment was very similar, although it was supposed to have been planned so that any troubles which had shown themselves at Leyton might not appear at Lynn. At neither of these stations are gas engines to be employed for extensions; in fact, owing to such matters as vibration and other nuisances, high costs. the use of numerous small units, rope driving and so on, it is quite possible that abandonment of the present installations will be decided upon-if not in both towns at least at Leyton.

## Tenders Wanted For Electrical Plant.

The Corporation of Dublin is proceeding with a very extensive scheme for adding to its electric lighting system. Tenders are being invited until April 26 for the following: Six Lancashire, four water tube boilers and two economizers; two 1,000 kw. and two 500 kw. low-speed polyphase generators.

### LEGAL NOTES.

Judge Vinje's recent decision in the case of Harrigan et al., against the National Electric Manufacturing Company of Eau Claire, Wis., and thirty other defendants has been filed. The plaintiff's claim aggregated about \$280,000, based on an alleged fraudulent issue of stock. The court finds that the stock divided was issued in good faith. The result of the findings is that a larger number of the defendants get judgment, dismissing the plaintiff's complaint, while as to the defendants affected by the court orders set aside, judgment is entered against such defendants jointly, aggregating \$38,844.40 with interest.

Judge Simonton, of Harrisburg, Pa., has handed down an opinion which is exceedingly important to all street railway interests in that State, his conclusions of law being as follows: "First—That neither the Pittsburg & Birmingham Passenger Railway Company nor its lessee, the Pittsburg & Birmingham Traction Company, has the exclusive right to use and operate a street passenger railway on and over the Smithfield street bridge. Second—That the Sycamore Street Railway Company has a legal right, with the consent of the proper municipal authorities and the bridge company, to use and operate a street passenger railway on and over the Smithfield street bridge."

#### CANADIAN NOTES.

(From our Ottawa Correspondent.)

It is said that the Preston & Berlin Street Railway Company will build a line between the towns of Berlin and Preston, Ont.

The Electric Street Railway Company of Montreal complains that the adoption of the new two-minute time schedule by the city council will seriously embarrass the company. Mr. Wanklyn, the general manager, emphatically asserts that his company does not possess sufficient cars to run a two-minute service on many of the streets. It will not be possible, in his opinion, to give the increased service, unless the company is allowed to construct conduits for the transmission of in-creased power. The question of the conduits opens up an important consideration for the Roads Committee of the council, and, in order that the members of that body may the better understand the conduit system, they have decided on a trip to New York for an inspection of the conduits in use in that city.

Of the utmost importance to the thousands of investors in Toronto Electric Street Railway shares, is the scheme of the mayor of Toronto providing for the laying down of alternate lines. The mayor, in effect, claims that the only way to prevent the nuisance of overcrowding cars is to lay out a system of track extensions, to ask the company to construct these parallel lines, and, in default, call in a new company and permit it to build on streets designated by the council. Eight new routes, involving the laying of tracks on 139 streets, are outlined in the plan. The mayor's critics assert that the chief purpose of his alternative scheme is to aid the Metropolitan, a suburban electric railway, to get an entrance into the city, independent of the Toronto Electric Railway.

The street railway by-law that has been before the town council of Niagara Falls, Ont., for some time, granting the Sutherland Construction Company of New York a franchise to convert the old Niagara Falls, Wesley Park and Drummondville horse car line into an electric system, has finally passed the council. The franchise extends the old franchise fourteen years, making the life of the new franchise twenty years from date. It gives the company exclusive rights over specified streets, and five months' option on all other streets within the municipality. All electric trunk lines, after receiving permission of the town council to enter the municipality, can use the tracks of the local company less than one mile, the remuneration, failing amicable traffic arrangements, to be settled by arbitration. Mr. Grindel, of New York, solicitor of the Sutherland Construction Company, considers the franchise no more than a fair working the provides the grant level allocative line should franchise than any local electric line should receive, and it is altogether likely that his company will proceed at once with the conversion of the old horse car line into an electric sys-

The Hamilton, Grimsby & Beamsville, Electric Railway extends for twenty-three miles eastward of Hamilton, Ont., and every mile of its length is through a veritable garden. No more attractive trip can be found in Canada. The line carried, last year, 2,000 tons of fruit in baskets, and 4,500 tons of fruit and other products as freight, being the best return in three years.

Mr. S. S. Dickinson, superintendent of the Commercial Cable Company at Ganso, Nova Scotia, has gone to the Island of Fayal, in the Azores, to arrange for the reception of the company's German cable, which will land there. When completed, the cable will make a direct connection between New York and Germany Six hundred miles of this cable has just been

completed off the coast of Nova Scotia, and the object is now to begin paying out the cable from the Island of Fayal and running northwestward until a connection is made with the part referred to off the Nova Scotia shore. The steamer Faraday is now on her way to England, where more cable will be taken on, which will be used in making the connection. It is expected that this new link of the Commercial Cable Company will be completed in about three months' time, and when finished will make the fourth cable belonging to this company which crosses the Atlantic.

#### PERSONAL MENTION.

Mr. Thomas Glenn, superintendent of the Wetmore Electric Light Company of Lowville, N. Y., was instantly killed near New Bremen a short time ago by grasping a live

Mr. J. Kajulra, an expert electrician, recently sent by the Japanese Government to secure information about telegraphs and telephones, is now in this country He also desires to obtain information regarding electric street railway systems, as the introduction of electric tramways is now contemplated in Tokio, and in some of the larger Japanese cities in which they have not yet been introduced.

Mr. Henry Hine, who has been general manager of the Stapley Electric Company, of Pittsfield, Mass., since its incorporation in 1891, has resigned his position, to take effect May 1. Mr. Hine will move with his family to Colorado Springs, Col., where he has extensive electrical interests, which will receive his entire attention.

Mr. Gustav Schimpff, of Berlin, Germany, royal Government engineer, recently came to New York, and has been spending a few days in studying the electric system of Buffalo, N. Y., and the electric power houses of Niagara Falls.

Mr. Alexander Nebel, a Chilian employed at the General Electric works at Lynn, Mass., has been selected to represent the company's lamp department at the Paris Exposi-

Mr. B. Otis Danforth, for a number of years superintendent of the Cambridge (Mass.) Electric Light Company, has resigned his position with the company. He will take up his residence in Lebanon, Me.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended April 7:

Amsterdam, 11 cases, \$1,437; Antwerp, 72 cases, \$4,744; Argentine Republic, 49 cases, \$6,-528; Barcelona, 12 cases, \$528; Brazil, 33 cases, \$1,716; Bremen, 2 cases, \$27; Bristol, 109 cases, \$50,000; British East Indies, 113 cases, \$5,832; British West Indies, 17 cases, \$509; Central America, 14 cases \$412; Chili, 38 cases, \$2,546; China, 31 cases, \$1,127; Cuba, 876 cases, \$7,722; Dublin, 77 cases, \$20,855; Florence, 4 cases, \$42; French East Indies, 5 cases, \$123; Glasgow, 210 cases, \$3,919, Japan, 223 cases, \$6,029; Liverpool, 97 cases, \$6,816; Mexico, 49 cases, \$3,741; Porto Rico, 33 cases, \$1,070; Southampton, 5 cases, \$110; Stockholm, 1 case, \$115; U.S. Colombia, 4 cases \$73; Vienna, 2 cases, \$57.

### INCORPORATIONS.

The Knoxville Power Company, Knoxville, Tenn -to manufacture electricity for lighting and power. Capital stock, \$10,00). Incorporators: J. T. Wilder, R. W. Austin, T. B. Cormick, J. M. Murphy and S. R. Morrow, all of Knoxville.

The City Lighting Company, St. Louis, Mo. This company is the active agent of the Seckner Contracting Company, which was the successful bidder for the contract for lighting the business district of the city for ten years. Capital stock \$600,000. Stockholders George Mayer, M. C. Bergman, E. M. Tyner and John H. Brown.

The Dr. Spaulding Electric Belt Company, Syracuse. N. Y. Capital stock, \$100,000. Directors: Samuel J. Spaulding of Canton, O.; J. N. Willard and B. P. Wright of Syracuse.

The Merchants' & Manufacturers' Electric Light, Heat & Power Company, Pittston, Pa.—to supply light, heat and power. Capital stock. \$10,000. Incorporators: W. F. Hallstead, E. M. Stack, M. W. Collins, G. M. Hallstead and F. C. Hand, all of Scranton.

### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N W, Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks. Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304. Broadway, New York City. N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED APRIL 8, 1900.

ELECTRIC RAILWAYS AND APPLIANCES,
646,460. Trolley, William B Potter, Schenectady, N. Y.,
assignor to the General Electric Company of New York,
Filed Dec 14, 1898.

### GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Atlanta, Ga.—E. Woodruff, president of the Atlanta Railway & Power Company is preparing to erect an electric light and power plant.

Anburn, N. Y.—The Auburn Electric Light Com-pany contemplates making xtensive improvements to its electric lighting plant. J. Moore is president.

Broadalbin, N. Y -B ds will be received until April 15 for the erection of an electric light plant, to cost about \$10,000. Address J W Cleveland.

Brownville, Me.—The question of erecting an electric light plant is being discussed here.

Cato, N Y.—A movement is on foot to have this village lighted by electricity.

Clinton, Conn.—This town and Guilford are to have

Crystal Springs, Miss.—Bids will be received until April 16 for the material and construction of an electric light plant. Address C. A. Bedding, clerk.

Eddyville, Ia.—There is some talk in official circles about an electric light plant for this place.

Ephraim, Utah.—The city council has directed a pecial committee to secure a site for an electric light

Evergreen, Ala.—This city has decided to issue \$25,000 in bonds for the purpose of erecting an electric light plant and waterworks.

Fairfield, Conn.-The Uncowa Water & Lighting Company has been granted permission to erect an electric light plant and waterworks. S. C. Sherwood is president.

Guthrie, Okla.—Quigley & Co. of Sedalia, Mo., have applied for a franchise for an electric light plant.

Highland, Ill.—The question of bonding this town will be submitted to a vote of the people at the spring election, for the building of an electric lighting plant.

La Grange, Ga.—The city council has decided to purchase new machinery for the electric light plant, making the capacity 1,500 incandescent lights.

Lakeview, Ore.—The town council has purchased the electric light plant of J. Anthony at a cost of \$2.600 and will add to it about \$7,400 or more in the way of additions and improvements.

Marshfield, Ore.—This city will vote on the question of building a municipal electric light plant.

Minneapolis. Minn.—The Pillsbury Washburn Company has decided to install an electric light plant for lighting all its mills.

Natchitoches. La.—This city will hold an election on April 27, to decide upon the issuance of \$20,000 of bonds for the construction of waterworks and an electric light plant. J. C. Trichel, secretary.

New Iberia, La.—This city has voted the issuance of \$112,000 of improvement bonds for the erection of an electric light plant and construction of waterworks. Address Weeks & Weeks.

Omro. Wis.—A. P. Hoyt of Joplin, Mo., has been here looking over the field with a view of putting in an electric light plant.

Parker, S. D.—The citisens of this place are agitating the question of securing an electric light plant.

Red Wing, Minn.—F. W. Steeg of St. Paul has pre-pared estimates for a municipal electric light plant.

Ruston, La.—Arrangements are being made to establish an electric light plant here.

Santa Clara. Cal.—It is stated that \$39,000 in bonds have been sold for the purpose of erecting an electric

Springfield, Kv.—The citizens of this place are agitating the question of erecting an electric light plant.

Wallingford, Conn.—The council is to put \$15,000 more into the enlargement of the electric light plant owned and operated by the village.

Warren, O.—Mr. Buckman of Youngstown, backed

by a company, expects to put in an electric light plant at this place.

Yreka, Cal.—The citizens of this place are discussing the question of erecting a municipal electric lighting

### STREET RAILWAYS.

Annapolis, Md -The Beltimore County & City Railway Company, recently incorporated with \$59,000 capital stock, will build an electric railway. R. F. Choate, J. S. Waters and J. S. Russell are interested.

Bakersfield, Cal.—The Bakersfield & Kern Electric Railway Company has been incorporated for \$250,000 to construct and maintain an electric railway in Kern County C. R. Eager, S. V. Cushing, H. A. Bicdget and F. V. T. Whoiff are interested.

Catonsville, Md —The promoters of the proposed electric line north of here, which will connect with the Edmondson avenue line and run to Alberton, Howard County, have saked the property owners along the line to subscribe \$25 000 toward the building of the read.

Denver, Col -It is reported that another party of local capitalists is discussing the project of building an

electric line similar to the one proposed by the pro-moters of the Denver, Boulder and Northern project.

ELECTRICITY.

Goodrich, Mich—The people of this village are in favor of the Detroit, Lake Orion & Flint Electric Road, and in order to so ure it are willing to give the promoters a bonus of \$1,000 a mile, and a private right of way across Atlas township.

Kansas City, Kan.—F. Ogg, J. L. Pettijohn and J. E. Tryon have petitioned the board of county commissioners in this city, for a franchise to construct a double track electric interurban railroad between R sedale, and the western line of Wyandotte County.

Ligonier, Ind.-Sol. Mier, the Ligonier banker, bas received the grant of a franchise for an electric railway line from Lagrange to Warraw through three counties. It is proposed to build the road to connect with the Goshen and Orland, and the Legansport and Kendaliville lines.

Louisville. Ky.—The Louisville Railway Company will change its Bardstown branch to an electric line. D. J. Minary is president of the company.

Marshall, Mich.—The city council has granted a franchise for an electric railroad through this city to the Kalamazoo River Valley Electric Company. The company proposes to build an electric railway from Battle Creek to Jackson.

New Castle, Ky.—Parties from out of the State have been investigating into the project of building an electric railroad from here to Eminence. The prospects for the road are claimed to be good.

Piedmont, W Va.—An electric railway is to be constructed from Keyser to this place, a distance of five miles

Richmond, Ind.—The Wayne County commissioners have granted a franchise to J. J. Freeman and J. M. Lon'z, of this city, to build an electric line from Bichmond to the Henry County line, 20 miles west. It is claimed that the J. Pierpont Morgan syndicate is behind the project.

San Mateo, Cal.—The San Francisco & San Mateo Electric Railway Con pany has received a franchise from the city trustees.

Stewartstown, Pa.-Messrs. M Kay & Griffith, of Baltimore, who are interested in the construction of the electric light plant at this place, have made a proposition to the railroad efficials to convert the road into an electric line. The cost of the change is estimated at from \$15,000 to \$20,000.

Taunton, Mass —Articles of association have been published for the construction of an electric railway from here to Fairhaven, an opposition line to the one now established via Middleboro.

West Chester, Pa —The right of way for the proposed West Chester, Kennett & Wilmington Electric Railway Company is being secured.

Wheeling, W. Va.—The Wheeling & Wellsburg Street Bailway Company has applied for a franchise for an electric road from Bethany to West Liberty, Greggs-ville, Altenheim, and the National road to this city.

Worcester, Mass.—A new company to be known as the Worcester, Rochdale & Charlton Street Railway Company will construct an electric railway from Charlton to this city a distance of about ten miles.

Ypsilanti, Mich — Capitalists of this city are considering a proposition to construct an electric railway between Windsor and Leamington. If satisfactory arrangements can be made with the authorities of Essex County, it is probable that the premoters of the scheme will apply for a charter at the next session of the Legislature. islature.

#### COMPANY MATTERS.

Alexandria, Ind.—The Union Traction Company of Indiana is erecting a large building here to cost \$30,000, for a sub-power station to be used for the storage of two batteries for their lines between here and Elwood and

-The Chattanooga Electric Street Chattanooga, Tenn. Chattanooga, Tenn.—The Chattanooga Electric Street Railway Company will purchase at once sixteen new open cars and ten new closed ones, which will make a total expenditure of about \$90,000 for cars alone. Other improvements on the local lines are also contemplated and the company intends to expend a large amount of money in the very near future improving its system and saving. and service.

Colorado Springs, Col.—The Colorado Springs Light & Power Company is contemplating the enlargement of its plant and more than \$50,000 will be put in improvements at once.

Malvern, Pa.-An electric light, heat and power company has been organized here.

company has been organized here.

New York —The United Gas Improvement Company of Philadelphia and this city, which recently absorbed the Bridgeport Traction Company, will take over the property of the Derby Street Railway Company, capitalized at \$150,000, within a week. The syndicate will apply to the Legislature at its next session for a franchise to extend the road to Seymour, four miles up the Naugatuck R ver.

Niagara Falls, N. Y—A recent fire destroyed the plant of the Electrical Lead Reduction Company located here. The loss is estimated at \$25 000 President Salome announces that the plant will be rebuilt and increased to ten times its former size.

Pittsfield, Mass.—The Stanley Electric Manufactur-ng Company is to remain in this city.

Richmond, Va.—The Richmond Railway & Electric Company, foot of 7th street, will make extensive improvements to its plant. E. W. Trafford is superintendent

Sault Ste. Marie, Mich.—The Edison Electric Com-pany of this place has had plans prepared for a 40,000-horse-power electrical equipme t.

Waterville, Me.—The Waterville & Fairfield Railway & Light Company will spend about \$20,000 for installing new lighting machinery. W. S. Wyman, manager.

#### MANUFACTURING.

Elwood, Ind.—The Lee Electrical Manufacturing Company has been incorporated here, with \$50,000 capital. It absorbs the Robinson Hester Company, capital. It absorbs the Robinson means, and will manufacture electric lights and heating ap

Littleton, N C — E Johnston, secretary of the Mon-tank Water & Electric Power Company of this city, wants to correspond with manufacturers of electric plants.

Louisville, Ky .- The Kentucky Electrical Company manufacturers of motors and power creased its capital stock to \$50,000. n machinery, kas in-

Marlin, Tex.—C. C. Chatham, of this place wants rices on dynamos, boilers and engines, elevators, refrigerating machinery, etc.

Newark, N. J.—A company recently incorporated in which Edmund Dickey. H. F. Billmeyer and W. H. Gardner are interested is known as the Consumers' Carbon Company and will manufacture electric light carbons on a capital stock of \$500,000.

New York.—The Russell Electric Mallet Company, formed some time ago in New Market. Md., has removed its plant to this city where the company will manufacture dentists' mallets to be operated by electricity.

Philadelphia, Pa.—The Wirt Electric Company of this city incorporated last week in Dover, Del., will manufacture and deal in electrical instruments and machinery.

## POWER AND TRANSMISSION PLANTS.

Chibushus, Mex.—The authorities of this State bave granted the necessary permit to a syndicate of American capitalists, headed by R. M. Burke, of Chicago, to establish a mammoth electric power plant on the San Juan R ver, 87 miles southwest of this city, sund 47 miles from Parral, the two principal cities in the State. The power will be conducted to these cities and used for running industrial plants. The syndicate binds itself to expend not less than \$1,000,000 in the enterprise.

E'laworth, Me —The E'laworth E'ectric Light & Water Company contemplates adding an electric power generating plant to its station.

generating plant to its station.

Kingston, N Y—There is a rumor affect that New York parties, backed by well known moneyed men. are making arrangements to utilize Kasterskill Lake, with which to secure and furnish electric lights and power to the villages in its vicinity. Pipes are to be run from the lake to Haines Falls, where a power house will be located. From there wires will be strung to Palenville, Tannersville and Hunter for the transmission of the electrical nower. electrical power.

Tallsdega, Ala.—The question of transmitting power for electric plants is being discussed here and at Mountain H me. The power from the waste waters of Tallsdega. Choccolocco and the Coosa Valley would be more economical than can possibly be derived from the use of steam, and the cost reduced to a minimum.

#### AUTOMOBILES.

Cheshire. Conn—Walter Scott, proprietor of the Waverlev Inn of this place, is talking of establishing an automobile busline to run between New Haven, Cheshire and Southington. Mr. Scott wants to purchase two vehicles calculated to seat from 18 to 20 passer gers, and claims that there will be no trouble in securing the needed funds.

Hartford, Conn—A new delivery wagon has been added to Brown, Thomson & Co.'s delivery facilities. It is a handsome automobile built by the Columbia & Electric Vehicle Company and is the first of its kind to be put in use in this city.

New York.—Automobile coaches for the Fifth avenue stage line made trial trips last week between Washington Square and 86th street. They were operated successfully.

#### MINES.

Georgetown, Col.—The prospect of a large power plant here to supply electrical power to the mines in the vicinity is approaching realization. Frederick Dowey of the Bank of Clear Creek is the central figure in the United Light & Power Company, which, it is reported, will proceed at once to put up a plant at an outlay of \$100,000 or more.

outlay of \$100,000 or more.

Ophir, Col.—The Butterfiv-Terrible group on the West Stope of Yellow Mountain. Iron Springs mining district, San Miguel County, about one mile from this place, was recently purchased by a corporation for \$200,000. An electric plant is to be installed, and an effort is to be made to introduce electric drills, when the proper drill is found. Another improvement contemplated is the installation of cyanide tanks for the treatment of the tailings from the concentrating tables, whereby a much closer saving of the value will be effected. will be effected.

# THE TELEPHONE WORLD.

The La Crosse Telephone Company.

The La Crosse Telephone Company is primarily a corpora-

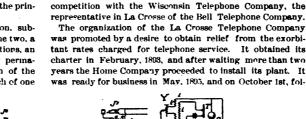

tion of the people and for the people of La Crosse, Wis. It

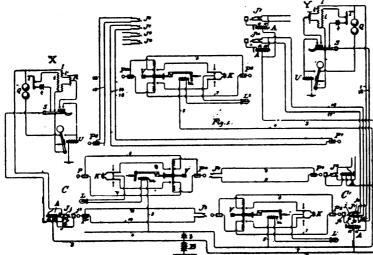

was among the very first to enter the independent field in

#### A Telephone-Exchange System

The accompanying illustration shows a telephone exchange system, patented last week by Edward E. Clement of Washington, D. C. No less than nine patents were issued on April 8 to the inventor covering the details of the system, the principal claim of which reads as follows:

"In a telephone exchange system, a central station, subscribers' stations and line-circuits interconnecting the two, a switchboard at the central station divided into sections, an answering and connecting jack and an annunciator permanently connected to each line circuit at one section of the switchboard, an answering jack and a signal for each of one

or more lines located at another section of the switchboard, circuit connections from the answering-jack to the answering and connecting jack, and means at the latter jack to continue such circuit connections to the subscriber's line, whereby the subscriber may either call or be called ordinarily upon one section of the switchboard but upon occasion may have his line prolonged for the purpose of answering his calls to another section of the switchboard, substantially as described."

The Southern New England Telephone Company has won its first case under the new general telephone law of Connecticut, which compels projectors of independent telephone companies to ask the Superior Court of the State to pass upon the question of public necessity and convenience. In the case under trial promoters of an independent company in New London, Conn., made the appeal a few months ago and the matter was tried at great length, a large amount of expert testimony being introduced on both sides. Judge Thayer of the Superior Court of New London County recently handed down a decision finding for the Southern New England Company and dismissing the case. The decision is final except as to questions of law, and is of extreme importance as a precedent in that State, where a number of independent telephone enterprises have been swaiting the finding of the court

The annual meeting of the stockholders of the Frederick County Telephone & Telegraph Company was held in Frederick, Md., recently, when the following board of directors was elected: James E Walker, Dr. P. D Fahrney, Col. D. C. Winebrenner, Edwin Devilbiss, Dr. Franklin B. Smith, William P. Maulsby, Jr., and Daniel T, Ordeman. The board organized by electing James E. Walker, president; Daniel T. Ordeman, secretary, and Dr. Franklin B. Smith, treasurer. This month the company will enlarge its plant by extending its lines in various sections of the county now without telephonic connection, and by installing a new 500-connection switchboard for metallic circuits, which will be supplied the subscriber to replace the grounded ones. Work on the line from Frederick to Thurmont has already been begun.

The contest for the independent telephone franchise in Wheeling, W. Va., is said to have suddenly been livened up by the vigorous action taken by the Home Construction & Telephone Company. In addition to offering a cash bonus, accompanied by a certified check, the company has placed itself in an advantageous situation by corcluding agreements with the Central West Virginia Telephone Association and the Ohio Telephone Association, assuring its connection with all independent companies in West Virginia and Ohio.

In the case of Davis against the Pacific Telephone & Telegraph Company the Supreme Court of California has recently decided that penal statutes forbidding injury to or removal of telegraph wires and poles are applicable also to telephone wires and poles. lowing, operated an exchange with more than 400 subscribers. The La Crosee Telephone Company is daily increasing its number of patrona, and enlarging its business, so that to-day it has nearly 800 connections, including the city offices, fire stations, schools, county building and offices and police department. Its service is of the very best, and a vast improvement over conditions existing when it went into business. Every new device for the improvement of its service is adopted, and the officers and manager are alert to give its patrons the very best service possible.

Its rates have not varied from the day it opened its plant to the public, and they have been uniformly maintained at \$2.50 % month for business and \$1.50 a month for residence telephones. When the rates formerly exacted by the old company of \$4 to \$6 for business and \$3 a month for residence telephones are considered, it is easy to compute what the advent of the La Crosse Telephone Company has meaut, and what it will continue to mean to the telephone subscribers of La Crosse; during the five years since the Home Company installed its plant, more than \$46,000 have been saved to the telephone users of that city.

The New England Telephone & Telegraph Company has filed the following certificate of condition with the Massachusetts Secretary of State: Assets Real estate, \$20,119; cash and debts receivable, \$1,585,162; merchandise, material and stock, \$586,649; plant and franchise, \$16,969,710; miscellaneous, \$820,667; total. \$19,992,307. Liabilities—Capital stock, \$13,759,100; debts, \$4,387,866; reserve, \$754,755; balance, profit and loss, \$1,090,586; total, \$19,992,307.

Durham, Greensboro and Winston, N. C., are now connected by telephone, the first call being made a few days ago! The line is owned by the Inter-State Telephone Company. Charlotte and Winston are not yet connected, but it is reasonable to expect a line between the two cities within a month or two. Soon Charlotte will be able to talk to people all over the State of North Carolina.

The Cumberland Telephone & Telegraph Company has authorized the manager of the exchange at Jackson, Tenn., to make reductions in telephone tolls for nearby stations, as follows: One to seven miles, 10 cents; seven to fifteen miles, 15 cents; fifteen to twenty miles, 20 cents.

The Delaware & Atlantic Telephone Company has asked permission of the council of Ambler, Pa., to entend its lines through that borough.

The capital stock of the Ava & Southern Illinois Telephone Company of Ava, Ill., has been increased from \$2,500 to \$5.000.

The Hotel Cadillac of Detroit, Mich., has made a contract with the Michigan Telephone Company for 200 long distance telephones.

#### Good Service Hurt the Bell.

A dispatch from Staunton, Va., to the N. Y. "Commercial says: "The telephone conditions which prevail here are decidedly interesting. Some years ago the Bell Company began operations here and established an exchange with about 200 subscribers, the annual tariff being fixed at \$50.

"This rate was considered too high, and some time later the Mutual Independent Company was started, with rates at \$10 a year. This caused the Bell Company to reduce its tariff first to \$40 and lately to \$6 a year. "Meanwhile the Mutual Company extended its lines

"Meanwhile the Mutual Company extended its lines throughout this and five other counties, with a subscribers' list of 500. The charge was raised to \$15, but the service is of a superior character, for a merchant can sit in his office and converse with people in every post office and store in Augusta, Rockingham and Rockbridge counties, without extra charge, and with many places in Nelson, Alleghany and Highland counties. Probably one-quarter of the business of this locality is done by telephone.

"The Bell lines do not extend out of town. This company has made unsucce-sful efforts to secure legislation to injure its successful independent rival."

The Southern Bell Telephons & Telegraph Company, which has a monopoly of the telephone business in Birmingham, Ala., and its prominent suburbs—Ensley, Pratt City, Woodlawn, Besserrer and Woodward—is fighting a franchise for a home company to 8. B. Claypool and associates, who have petitioned the city council to grant a charter for the installation of a new system. The new company makes a proposition that a rate one-half of that charged by the Southern Bell Company will be charged. The present company gives a good service, having all its wires in the heart of the city underground, but the prices are quite high, 'phones in residences being \$36 per annum, and business 'phones \$48.

C. N. Haskell, of Ottawa, O., president of the Lone Star Telegraph & Telephone Company, with a capital stock of \$500,000, which recently filed a charter in Austin, Tex., has been some time in that State directing the preliminary arrangements for the construction of toll lines, and the establishment of local telephone exchanges in all the principal cities. He states that the company proposes to expend not less than \$1,000,000 in Texas, and that the proposed system will be a strong competitor with that of the Southwestern Telegraph & Telephone Company.

A dispatch from Connellsville, Pa., to a Pittsburg paper states that the directors of the Connellsville, Klondike & Normalsville Telephone Company held a unique meeting recently. The directors live many miles apart, separated by mountain ridges. Each, however, has a telephone. All got together on the line, increased the capital stock from \$3,000 to \$5,000 and transacted other business Motions were made and seconded, resolutious offered and adopted over the wire.

The Southern New England Telephone Company has gained control of the telephone service in Norfolk, Conn., which system has heretofore been operated by the Norfolk Electric Light Company. The price paid is said to be \$17,700.

Efforts are being made in Pittsfield, Mass., to organize a local independent telephone company. The promoter of the scheme is Mr. William G. Simpson, formerly connected with the General Electric Company.

The Minneapolis council by a vote of 25 to 1, has repealed the ordinance granting a license to the Northwestern Telephone Exchange Company to operate in that city.

The Automatic Telephone Company has applied for a franchise in Holyoke, Mass.

## TELEPHONE INCORPORATIONS.

The Valley Telephone Company, Emlenton, Venango County, Pa. Capital stock, \$5,000.

The Ida County Telephone Company, Ida Grove, Ia. Capital stock, \$10,000. Incorporators: J. E. Conn, F. Brasted, both of Ida Grove.

The Apalachicola & Tallahassee Telegraph Company, Tallahassee, Fla.—to operate telegraph and telephone lines, Capital stock, \$10,000.

The Greenspring Telephone Company, Greenspring, O. Capital stock, \$8,000. Incorporators: J. C. Kanney, E. L. Johnson, P. T. Perin, R. D. Reynolds, H. W. Robinson and C. L. Smith.

The Citizens' Telephone Company, Kokomo, Ind. Capital stock, \$25,000. Incorporators: W. H. Turner, of Kokomo; C. E. Hardyke, H. B. Laly, C. S. Norton, all of Indianapolis.

## NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 16%@16%2.; Lake, 17@17%2.; casting, 16%@16%2.

The Strauton (Pa) Electric Light & Heat Company has been absorbed by the Electric Company of America.

The par value of the shares of the New England Vehicle Transportation Company has been reduced from \$100 to \$10—the amountpaid in.

From Boston comes a report that the Amalgamated Copper Company is earning at the rate of 18 per cent. per annum on its \$75,000,000 capital stock.

The copper market, holds firm with a fairly large business doing. The exports still continue very large. For the first five days of April they amounted to 2,232

The bill extending the power of the Rapid Transit Commission over all the boroughs of New York City was passed by the Legislature at Albany before it adjourned.

The following dividends were payble on Monday: Erie Telephone and Telegraph Company, 1½ per cent.; Michigan Telephone Company, 1½ per cent., and Wisconsin Telephone Company, 1¾ per cent.

A Detroit dispatch says that the Michigan Bell, and independent telephone exchanges were consolidated Saturday morning. All the independent telephones will be removed and the Bell system will number 14,000 subscribers.

For March the Metropolitan Street Railway Company, New York, reports green earnings as \$1,167,536, a gain over the like month last year of \$81,848; from July 1 gross aggregates \$10,514,586, a comparative increase of \$1,361,194.

The Imperial Electric Light, Heat and Power Company of St. Louis, Mo., has recorded a deed of trust to the Continental Trust Company and Louis Chauvenet of New York, in the sum of \$1,030,300, with a privilege of recording another deed for \$500,000 at pleasure.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 264@27j: New York Electric Vehicle Transportation, 124@13, New England Transportation, 64@7; Telephone & Telegraph Company of America 43@42; Gramophone 49@52.

The Brooklyn Union Elevated Railroad Company elected on the 5th inst. the following directors: S. L. Keeney, W. F. Sheehan, N. F. Brady, A. N. Brady, F. S. Flower, William C. Bryant, John Englis, John D. Kiely, T. S. Williams, John B. Taylor, C. L. Rossiter, Henry Siebert and J. G. Jenkins.

The Missouri & Kansas Telephone Company has placed a mortgage of \$1.125,000 on its plant with the Old Colony Trust Company to secure a new issue of bonds. The mortgage, placed on record Saturday, covers the company's property in the eighty-eight different counties in which it does business.

The Western Union Telegraph Company registered in New York on the 3d inst. a mortgage for \$20,000,000 to run 50 years at 4½ per cent. The Farmer's Loan & Trust Company is trustee. The Western Union building, New York, property on 5th avenue and 231 street, New York, and Chicago property are given as security.

The purchase of the Siemens & Halske Electric Company of America by the General Electric Company, which was denied on the 27th ult. by President Lloyd of the Siemens & Halske Company, is now confirmed. The control of the latter concern is said to have been resting for some time with the Weidner-Elkins syndicate who sold it out last week.

It is stated that the proposed new bonds of the Metropolitan Street Railway Company, to be issued to finance Third Avenue, are already being printed and that the deal with the underwriting syndicate has virtually been closed. The bonds will amount to about \$39,000,000 and will bear 4 per cent. interest. One authority says: "I think the bonds will bear the guarantee of the Metropolitan Company."

The New England Telephone & Telegraph Company of Boston has filed the following certificate of condition on February 28, 1900, with the Secretary of State: Assets—Real estate \$30.119; cash and debts receivable, \$1.585,162; merchandise, material and stock. \$586,649; plant and franchise, \$16.969 710; miscellaneous, \$820,667; total \$19.992,307. Liabilities—Capital stock, \$13,759,100; debts, \$4,387,866; reserve, \$754,755; balance profit and lose \$1,098,586; total \$19,992,307.

The to'al liabilities of the Forty-second street, Manhattanville and St. Nicholas Avenue Railroad, a part of the Third Avenue System, New York, were placed at \$3,279 390.13 in a report filed by Receiver Grant in the United States Circuit Court on the 4th inst. Among the liabilities are \$2,936,000 of funded debt, \$75.000 in loans on collateral, \$115.048 34 in unsecured loans, \$140,877 36 bills unpaid, and \$4 809 80 in conductors' deposits. The assets include 14 243 miles of track, real estate assessed at \$152,000 and rolling stock, etc., valued at \$189,020.36.

The American Telephone & Telegraph Company of New York, successor to the assets of the American Bell Company, has fi'ed the following balance sheet in Massachusetts: Assets—Real estate of \$1 380,560; equipment, \$3,849,630; plant, \$14,170,389; cash and debts receivable, \$8 320,735; supplies, \$310.852; patent rights, \$10,350; miscellaneous, \$65,673 968; total, \$93 116,454. Liabilities.—Capital stock, \$70,975,500; debts, \$19,105,837; reserves, \$935,635; profit and loss, \$2,099,482. total, \$93,116,454.

The New England Electric Vehicle Transportation Company, a New Jersey corporation doing business in Boston, has filed the following certificate of its condition March 1, 1900, with the Massachusetts Secretary of State: Assets—Land \$163 350; buildings \$112,719; machinery \$52,066; vehicles \$311.638; cash and dota receivable \$1.484; 63; stocks in process \$2 637; patent rights \$25,000, miscellaneous \$169 352; balance profit and loss, \$13 478; total \$2,274,236. Liabilities—Capital \$2,242,600; debts \$31,636; total \$2,274 235.

The transfer of the Bridgeport Traction Company of Connecticut by its Newark owners to A. M. Young and others of Connecticut was closed in Newark on the 3d inst. About \$24,000,000 worth of stock changed hands. The new company was organized by the election of the following officers: President, A. M. Young; vice-president, Randall Morgan: secretary, A. G. Runkle; treasurer, Lewis Lilie. The stock cost the Newark people from 20 to 32 and it was said that they received for it from 63 to 75.

An agent of the American Railways Company, of Philadelphia, has been making an examination of the capital Traction Company's properties, in Washington, D. C., in furtherance of the deal for their purchase. No secret is made now of the fact that the American Railways Company wishes to purchase the Washington line. The matter has resolved itself into the question of agreeing on a price simply and officers and prominent stockholders of the Capital Traction Co. acknowledge this much.

The Nisgara Falls Power Company of Buffalo recently filed with the New York Secretary of State a certificate showing an increase of capital stock from \$3.500,000 to \$6.500,000. The increase of \$3.000,000 is to consist of 30,000 shares. Up to and including April 1, 1995, the 3,000 shares are to be issued only at par and in conversion at par for 6 per cent coupon gold debentures of the company. The certificate or increase states that the amount of capital stock of the company actually paid in is \$3.331,000, and that its debts and liabilities consist of \$9,629,000 first mortgage bonds and other indebtedness of \$30,000.

## EDITORIAL NOTES.

United States
Marconi Patents.

On another page of this issue will be found a diagram and short description of

one of three patents issued by the United States Patent Office to William Marconi on April 10. All of these patents refer to the receiving apparatus and are of considerable importance.

As is now generally known Mr. Marconi obtained a patent on his system of wireless telegraphy in this country in 1896 with fifty-two claims, covering every known form of coherer and the coherer in combination with other apparatus. This fundamental patent described the combinations of a Hertz-Righi oscillator, Branly tube, electromagnetic tapper, capacities, and inductive and non-inductive resistances.

On May 9, 1899, another patent was taken out by Marconi which related to the enclosure of the receiving apparatus in an iron box, the principal claim reading as follows:

"The combination of a transmitter, a receiver, an aerial conductor, a metallic box containing the receiver, earth connections to one terminal of the transmitter and to the box, an interchangeable connection from the aerial conductor either to the other terminal of the transmitter or to one terminal of the receiver. a connection between the other terminal of the receiver and the box, a relay operated by the receiver, a telegraph instrument outside of the box, a connection between the box and one terminal of the relay, a connection between the box and one terminal of the telegraph instrument, a connection insulated from the box between the other terminals of the relay and telegraph instrument, a coil of insulated wire outside the box in the latter connection and a metallic covering to the insulation in connection with the box."

From this it will be seen that one connection is to be made by the metal of the box, while the second connection is made by a coil of insulated wire covered with tinfoil, but outside the box.

The next patent taken out in the United States by Marconi, namely, that which appeared on June 27, 1899, covered the use of an induction coil in the receiving circuit. The waves were to be transmitted through an induction coil, the primary of which was con-

nected with the aerial conductor, and the secondary with the coherer. It was claimed that "the use of the coil not only improves the signals, but also prevents to a great extent any interference due to atmospheric causes, as any atmospheric electricity collected by the aerial conductor escapes to earth through the primary of the coil, thus preventing a charge from accumulating and discharging itself through the coherer."

The three patents granted last week to the Italian inventor are numbered 647,007, 647,008 and 647,009 respectively. They are all similar in general principle, and differ only in detail and in the method of connecting up. They refer especially to the induction coil, as will be seen by the following claim:

"In a receiver for electrical oscillations, the combination of an imperfect electrical contact, a local circuit through it, an induction coil, the primary of which consists of two wires connected in parallel, wound in four layers, the first and second layers being formed of one wire, and the third and fourth of the other, the secondary of which consists of several layers, the number of turns in the outer layers being less than in those next the primary, a capacity connected to one end of the primary, a conductor connected to the other end, connections between the ends of the imperfect contact and the ends of the secondary, and a condenser in one of the latter connections."

This makes in all six patents that have been granted by the United States to Marconi for wireless telegraphy apparatus, and in this connection it should be noted that the three just issued are assigned by the inventor to the Wireless Telegraph & Signal Company, Limited, London.

Stockholders Will Now

Get Returns.

The stockholders of the Third Avenue Railroad of New York are at last on an "ascending scale"—that is, they now

something tangible in sight for their invest ments. The enormous debt saddled upon the road by reckless management—which forced the stock down from 200 to 45½—is to be taken care of by the Metropolitan Street Railway Company, and the prospects of the mismanaged road are now so bright that the stock was quoted yesterday at 112½.

At a joint meeting of the directors of both companies the Third Avenue Bailroad was

leased to the Metropolitan Railway Company for a period of 999 years, subject to ratification by the stockholders at a meeting to be held next month. According to the terms of the lease the Metropolitan guarantees principal and interest on Third Avenue bonds; during the first four years the Metropolitan will pay to Third Avenue stockholders all earnings above fixed charges and operating expenses; for the fifth and sixth years the Metropolitan will pay Third Avenue stockholders 5 per cent. on the capital stock of \$16,000,000; for the next four years the Metropolitan will pay 6 per cent. on the capital stock, and after the first ten years, and for the remainder of the 999 years, the Metropolitan will pay 7 per cent. on Third Avenue stock.

The plan adopted for canceling the old debt is for an issue of bonds guaranteed as to principal and interest by the Metropolitan Company, and secured by mortgage on the Third Avenue property. The bonds are first consolidated, are payable in gold, mature in 100 years, and draw 4 per cent. interest. The entire issue of bonds will amount to \$50,000,000. Of this sum \$35,000,000 have been taken by Kuhn, Loeb & Co., and the remaining \$15,000,-000 is reserved to retire prior liens.

President Vreeland says that the sale of the bonds insures the completion of the plans of development formerly entertained. The motive power of every line owned or operated by Third Avenue will be made to conform to that on the main road as the Metropolitan power house can furnish all the current necessary.

It is expected that within forty days there will be a termination of the receivership, and it is to be hoped that the vicissitudes of the road will prove a salutary lesson to directors who do not direct, but who, when financial troubles come, appear to be the suppliant tools of a merciless band of stockjobbers and a coterie of scheming politicians.

\*

Magnetism as a

From time to time we have referred to ex-Growth Stimulator. periments that have been made with the

electric current to ascertain its effect on the human system. As a cure for tuberculosis, when the disease has not progressed far, it is of value, and it is also claimed that by proper manipulation it can be made to retard, if not cure, certain forms of cancer. In this connection it is interesting to note that Prof. Herdman, of the University of Michigan, has been investigating the effect of the magnetic field of force on human beings and animals. Referring to this subject Prof. Herdman is reported as saying:

"Whenever a current of electricity traverses an animal body, the magnetic field resulting from the current and surrounding its path must disturb in some manner the molecular (physical) and atomic (chemical) activities that are going on in the tissues and fluids through which the current of electricity passes. Almost everything now known about electromagnetism seems to imply that a magnetic field, whether produced by a permanent magnet or by a current, reacts in some manner upon all kinds of matter within the field, and in such a manner as to rotate in some degree every molecule, so as to make it assume a different position from what it would assume if not thus acted upon. We have found that the most noticeably physiological response to an electric current obtained from living animals is that resulting from sudden and wide

differences in the intensity of the current. Having learned this, we have placed the human subjects of our experiments in a magnetic field occasioned by an alternating current. This produces no chemical changes in the body, but merely accentuates normal chemical action."

The apparatus which has been made use of in carrying out the experiments consists of a solenoid about three feet in diameter, through which an alternating current of five amperes is made to pass. In the case of animals, what might be termed a solenoid cage was used. These animals, which, by the way, were guinea pigs, were divided into two groups of about the same size and age, and were carefully weighed. Each group was subjected to conditions in all respects similar, except that from 5 o'clock each evening until midnight, one group was placed in the solenoid cage and subjected to a magnetic bath. This plan was pursued with each pair of groups selected from the time the animals were a few weeks old until they had reached their full growth. Commenting on the results obtained Prof. Herdman says:

"Without exception, the animals immersed in the alternating current began to outstrip the others in weight at the end of the first week and a gain of from 18 to 24 per cent. in favor of the animals within the magnetic field was apparent each succeeding week, until they neared the period of full development, when the weekly gain became perceptibly less.

"During two years ten separate groups of animals have been experimented on, each group containing from three to five animals, and uniformly those placed in the magnetic field gave evidence for the first few weeks of accelerated nutritive action. In the case of two groups, when the experiment was continued beyond eight weeks the curve of increase shown by the magnetized animals, which until then ran 20 per cent. higher than that of the other group, gradually declined; at the end of the twelfth week their weight had fallen a little below that of the other group."

As to the usefulness of his discovery Prof. Herdman observes:

"So far as these experiments go they appear to show that alternating magnetic stress is in some way related to a quickened metabolism of tissue; that the magnetic energy goes through some sort of transformation and reappears as physiological energy. Growth can undoubtedly be accelerated by the use of electricity, but it must be admitted that the growth thus obtained is unhealthy, and in the end is disadvantageous to man or animal. Such diseases, however, as rheumatism and gout will in time be treated successfully by methods similar to those employed in the experiments described, that is, by enclosing the patient for a short period each day until improvement is effected in an electro-magnetic field."

THE Paris Exposition was formally opened on Saturday, April 14. The ceremony of inauguration, which took place in the Salle des Fêtes was simple, consisting of music in the form of French national airs, followed by a speech by M. Millerand, the Minister of Commerce, in which the Exposition was handed over to M. Loubet, the head of the State. The President of the French Republic replied in a five minutes' speech, and at its conclusion the musical part of the programme was resumed with M. de Saëns' "Hymne à Victor Hugo," followed by M. Théodore Dubois' "Marche Héroique." As in the case of former World Fairs, all the exhibits were by no means in place on the day of opening, the Machinery Building especially being in a state of chaos. Competent judges estimate that at least a month or six weeks must elapse before the great Fair on the banks of the Seine will have reached completion.

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

Gov. Roosevelt will give a hearing to-morrow, April 19, at Albany, at 3:30 P. M., on Assemblyman Sullivan's bill amending the act relative to the powers of electric light companies to condemn lands.

THE electric pumping station at Cerrillos, N. M., is now in operation, forcing a four-inch stream, three miles, to Madrid for the big electric power plant located there.

THE postoffice authorities at Denver, Col., have recently purchased an electrical stamp canceling machine. This is the third one installed there.

IT is reported that Miss Annie Mitchener, daughter of the owner of a trolley road running from Canal Dover to Unionville, O., a distance of 13 miles, is superintendent and manager of the line.

THE steamer Penobscot, of the Boston & Bangor Steamship Company's fleet, has recently been wired for electricity. Besides being fully equipped with electric lamps throughout, she will also be furnished with a powerful searchlight.

MR. GEORGE F. PORTER writes us that a special rate of railroad fare-being a fare and onethird for the round trip-has been granted by all the passenger associations for delegates attending the Twenty-third Convention of the National Electric Light Association to be held at Chicago May 22, 23 and 24.

THE plans for the new Philadelphia mint call for a large amount of electrical ma chinery including fourteen 45-horse-power motors for the coining department, sixteen 5-horse-power cutting motors, six 25-horsepower finishing motors, and one 5-horse-power hydraulic motor. An electro-refining equipment is desired for the melting and refining departments.

On April 14, an automobile race took place between nine members of the Automobile Club of America, the prize being a cup presented by a member of the Automobile Club of France. Fifty miles was the distance of the contest, the course being over the famous Merrick road, on Long Island, with start and finish at Springfield, and the turn at Babylon. Mr. A. L. Riker, driving the only electric motor car in the list of entries, easily out-speeded gasoline and steam, and covered the half cantury in 2 hours, 3 minutes and 3 seconds, or at a rate of speed of a mile in about 21 min-

The dangerous Diamond Shoals, at the outer edge of Cape Hatteras, are to be marked by a new lightship, a much stancher boat than those now in service off that dreaded spot. For many years it was deemed impossible to maintain a light there, but during the past two

years the Government has demonstrated the practicability of lighting the shoals, despite the occasional blowing adrift of the lightship during the hurricane months. The new ship, however, will have her own power to bring her back, should the enormous mushroom anchors with which she is to be provided fail to hold her. Electrically lighted, she will be a vast improvement over anything heretofore attempted in lightship construction.

ELECTRIC power is being transmitted over an aluminum cable three-eighths of an inch in diameter over a circuit eighty miles long at Provo, Utah, according to H. R. Newcomb, one of the large stockholders in the Telluride Power Transmission Company, which owns the Provo plant. Mr. Newcomb is a banker of Cleveland, Ohio, and has recently returned home. "We are generating about 2,000 horse-power," he said to a reporter, "and sending it to the mines at Mercur and Tintic. We have a demand for all the power we can furnish, and shall enlarge our plant at once to 6,000 or 8,000 horse-power."

WILLIAM BROWN, of Brooklyn, the cycle rider who last fall broke the 1,000-mile road record, will soon start on another record-breaking bicycle ride over the Long Island course. This time he will ride 2,000 miles, and has engaged multicycles and automobiles for pace. He has secured from villages through which he expects to pass permits for high speed, and hopes to break every record from twentyfour hours to six days. Motor cycles capable of running seventy-five miles without a stop at a speed of forty miles an hour will alternate in pacemaking with automobiles capable of fifty continuous miles at twenty-five miles an hour. The start will be made May 12, and the ride, with the exception of a short rest each day, will continue seven days.

The Chicago Telephone Company has entered into an arrangement with the Home Science Bureau of the Chicago Woman's Clubs, whereby it is now able to supply servants, chaperons, or women to take charge of weddings and social functions. The telephone company also takes orders for the removal of trunks and baggage, and will summon to its subscribers' aid the fire or police department if desired. The bureau assumes the responsibility for the domestic help supplied.

PHILIP P. NUNGESSER, superintendent of the Nungesser Electric Battery Company of Cleveland, O., has invented a new primary battery, which promises to be a valuable factor in automobiles. The battery "is designed especially for electrical ignition on gasolinepropelled vehicles. One of the features is that no oil is used on the solution of this battery. It is said that in all closed circuit batteries having an alkaline it is necessary to use a heavy paraffine oil on the solution to prevent it from decomposing. Oil is said to be unnecessary in Nungesser's battery. When used for motor vehicle ignition this battery has a capacity of about 3,500 miles. The total weight when ready for use is seven pounds."

At the Hotel St. George, Brooklyn, last Friday evening, Mr. George T. Hanchett, assisted by Captain J. McLeod Murphy and Mr. Clinton E. Whitney, gave an interesting talk on "Experimental Work with Electricity at Very High Pressure, Wireless Teleg-

raphy, the X-Ray and Illumination of Vacuum Tubes." Mr. Hanchett described experimental work with electricity at very high pressure and high tension discharges, explaining their character. There were experimental illustrations showing various forms of high tension. The third programme number was "Molecular Bombardment and Light Effect Produced Therefrom," illustrated by tubes of various degrees. Following this came ether vibrations, both visible and invisible. This included the electro-magnetic vibrations of wireless telegraphy and the X-ray. The last experiment was the exhibition of the Murphy Safety Electric Company's system of third rail propulsion, for which a working model was put in operation. Mr. Murphy said: "The overhead wires are a source of danger, and a new system, which was sought after by 588 inventors, has at last been This new system combines all the found. good qualities of the other system and eliminates the poor qualities." Mr. Murphy advanced the theory that within a year there would be a trolley line from New York to Bos-

J. M. FORDYCE, of Detroit, Mich., has secured permission from the State Boardof Public Works for experimenting with electric propulsion of canal boats on the Miami and Erie Canal. He will be permitted to select a stretch of ten miles in the vicinity of Toledo on which to construct his apparatus. He must begin within one year, and two and one-half years are given for the experiments to be made in. If successful he is to be given the right to operate his boats on the canal between Cincinnati and Dayton for 25 years, paying the regular tolls for the privilege.

It is expected that the citizens of Ottawa. Ont., will display their characteristic spirit of cordiality to the visiting delegates on the occasion of the convention of the Canadian Electrical Association, which will take place at the capital of the Dominion on June 27, 28 and 29. Arrangements are already well advanced for the convention. About six papers are to be read, and are looked forward to as being of the most interesting and instructive character to the electrical profession. Among these papers will be one read by R. B. Owens, professor of electrical engineering of McGill University, Montreal, on "Utilizing the Available Central Station Capacity," and another by Mr. F. H. Leonard, electrical engineer for Messrs. Pringle & Son, Montreal, on the "Effect of Power Factor on the Operation and Investment," with special reference to induction and enclosed arc lamps.

THE German rights in the Stone system of electric lighting of railway trains, described in the issue of Electricity of June 7, 1899, have been acquired by the Accumulatoren and Electricitatswerke Gesellschaft of Berlin.

The Holland submarine boat has been purchased by the Government. The boat becomes the property of the Government for \$150,000, but the Government will deposit \$90,000 of that amount with August Belmont & Co., of New York, in trust for the Holland Submarine Torpedo Boat Company, as a guarantee that the Government will suffer no loss for the money it advanced for the construction of the submarine torpedo boat Plunger. The money deposited with Belmont & Co. will be paid to the Holland Company when the Plunger has been accepted by the Secretary of the

Navy. The contract gives the Government the right to purchase the patents of the Holland submarine craft at any time, and provides for the appointment of a board, to consist of two naval officers, and one representative of the Holland Submarine Torpedo Boat Company to fix the price of the patent rights should the Government decide to buy them. The company binds itself to furnish other boats similar to the Holland should the Government want them, the price of each to be agreed on later, but not to exceed \$170,000. It agrees also to provide a crew for a reasonable length of time to instruct naval officers and seamen in operating the Holland.

A PORTABLE searchlight has been brought out. The arc is in the form of a Mangin mirror, having a diameter of seven inches. The lamp is so arranged that it can easily be brought in or out of focus, so that the beam may be concentrated or diffused as desired. The total weight of the lamp is fifteen pounds in aluminum or twenty pounds in brass.

It is reported that the French Aéro Club has received from an anonymous donor the sum of 100,000 francs, which is to be given to the aeronaut who, with a balloon, or any other aerial vessel will start from the headquarters of the club, pass round the Eiffel Tower, and return to the starting-point, a distance of seven miles, within half an hour. This competition is international. If the prize is not won within five years, it will be withdrawn. These experiments would no doubt be very interesting to the anonymous donor of the prize. but we should think, says the London "Electrical Engineer," that such experiments were scarcely suitable for trial over a great city like Paris, and in our opinion the sea would allow one a rather better chance if the machinery suddenly failed, and the sea would also in that event suffer less damage than the Paris public.

THE engraving of metal dies by electrolytic etching is a new process that a German company expects to work extensively. A plaster negative of the original is saturated with the electrolyte, and connected to the negative pole of a source of electricity, the metal plate to be etched being attached to the positive pole. As the cast and the plate touch, the circuit is closed, causing the metal to be dissolved at the points of contact. To get good results, the contacts must be but momentary, the insoluble particles in the metal being brushed away after each, and the accurate repetition of the touching at the same points is effected by an automatic machine, which also operates the brushes. The etching of a steel plate to a depth of onetwenty-fifth of an inch requires 600 to 700 contacts, of about 12 seconds each, the whole precess occupying 4 or 5 hours. The best electrolyte for etching steel is a ten per cent. solution of chloride of ammonium with a little hydrochloric acid, and the best current is 1.3 amperes per square inch at 8 to 12 volts, but the voltage must be smaller at the beginning, when only the points of the negative cast touch the metal.

#### Proposals Invited.

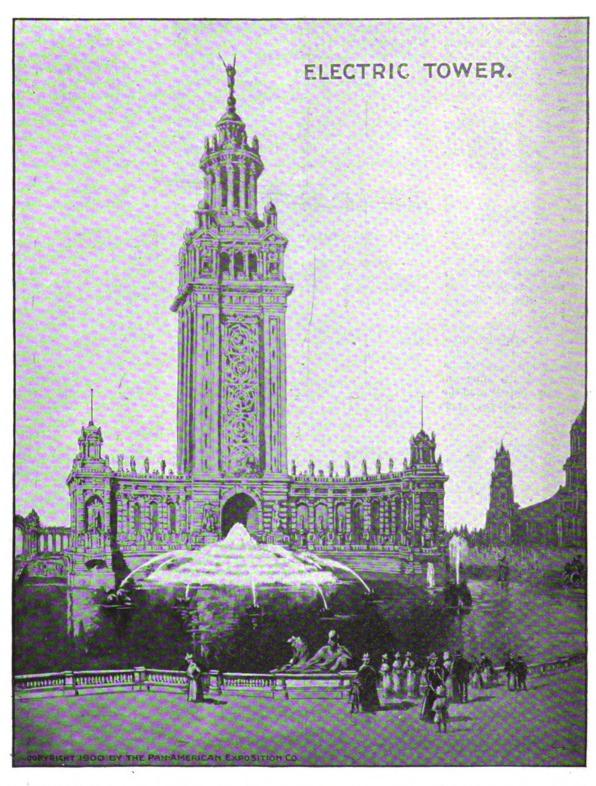

Sealed proposals are being invited until May 10, for furnishing the office of public buildings and grounds, Washington, D. C., with a quantity of electric battery supplies. Full information can be obtained upon application to Col. Theo. A. Bingham, Washington, D. C.

#### THE ELECTRIC TOWER AT THE PAN-AMERICAN EXPOSITION.

The dignified and stately beauty of the great Electric Tower, which will form the conspicuous center-piece of the Pan-American Exposition at Buffalo next year, will command the rapt admiration of every visitor. The genius of the architect has been taxed to preserve lines and elements of beauty in a work of such be seen by the accompanying illustration, is flanked on the east and west by long curved colonnades, which sweep to the southward and terminate in airy pavilions, forming a semicircular space 200 feet across. Within this space and in a high niche in the main body of the Tower are cascades, while all about the basin are leaping jets and countless playful figures, each with its spurt of water, combining to make a brilliant water scene. At the center

an aspect of great solidity to the base. The shaft of the Tower is treated with great simplicity. The center of each side is paneled with fantastically perforated work, through which is indistinctly revealed the massive framework of the Tower. This feature is calculated to produce a remarkable effect when lighted from within, as it is the intention to do. The main shaft of the Tower terminates in an elaborate entablature at the height of

tail proportions, but the problem has been well mastered.

The height of the tower is 348 feet above the surface of the broad basin in which it stands. Its position is between the Court of the Fountains and the Plaza, on the north side of the Mall. It looks down upon the Agricultural Building at the east and the Electricity Building on the west. The Tower proper, as may

of the niche is a tall geyser fountain, whose waters find their way from the high basin within the niche over successive ledges and among a multitude of vases to the level of the pool.

The main body of the Tower is eighty feet square. From the surface of the water to the top of the colonnades is seventy-five feet. This portion of the structure is enriched by a system of decorative rusticated bands, which give 200 feet. The crown of the Tower rests upon thi entablature, and is composed of three stories of diminishing proportions and varying design. The lower of these stories is an arcaded loggia, rich in ornamentation and having the wall surfaces brilliantly colored. Pavilionettes at the corners terminate in light fantastic cupolas. The second stage, or lantern of the Tower crown, is in the form of a high, circular colon-

nade, entirely open, so as to allow the effect of the sky to be seen between the columns. A spiral staircise within the colonnade leads to the last stage of the Tower, the cupola, over whose soaring dome is poised the superb figure of Electricity herself, thus dominating the entire Exposition, which owes so much to her generously exerted power.

From the water to the feet of the figure of Electricity is a vertical distance of 331 feet. The figure is seventeen feet in height.

The entrance to the Tower is across an ornamented bridge from the Plaza, on the north side. Elevators will carry passengers to the various floors, which will be devoted to different purposes of the Exposition, such as reception rooms, offices, restaurants, belvederes and amusement halls. A large restaurant, at a height of 200 feet, will give the diner a broad and beautiful view of the Exposition and the surrounding landscape. From the cupola the eye can sweep the whole Niagara frontier, and look far into Canada, beyond the majestic river that separates that country from the States.

Sculpture plays an important part in the decoration of the Tower. Two magnificent monumental groups of statuary flank each of the four sides of the base. Above the water niche in the southern face of the Tower is a magnificent escutcheon, representing the arms and seal of the United States. In the spandrels of the arch above the niche are sculptures in high relief. The pavilions and wings are also richly decorated with sculptures and other architectural devices. The entire exterior of the Tower will be studded with myriads of electric lights, so arranged that a great variety of effects can be secured. The use of electric lights in combination with the sparkling fountains and cascades will produce scenes of fantastic beauty.

#### THE ELECTRIC AUTOMOBILE.\*

BY A. L. RIKER.

In presenting this paper on the electric automobile for your consideration and discussion to-night, I will endeavor to clear up a few of the mysteries surrounding this type of vehicle. and demonstrate the advantages it possesses over all other forms of motor vehicles. In purchasing a vehicle -an automobile-for pleasure driving, one is naturally anxious to procure a vehicle that will require the least possible attention from the operator, which condition is met alone by the electric automobile. This may seem to be a very positive statement, but I shall prove it to be correct. To begin with, we must have a basis of comparison, and for this we must turn to that most widely used and popular method of vehicle propulsion, the hay motor, commonly known as the horse. My reasons for referring to him are as follows: You are all probably more familiar with this "motor" than any other and know how he automatically overcomes changes in his work. For instance, driving along a road, and arriving at the foot of a hill, your horse puts forth the extra effort necessary to accomplish the additional work without any attention on your part, and this is true only of the horse and the electric motor. All other motors require some manipulation, however slight, on the part of the operator. Another feature that they possess in common is the ability to exert the greatest traction effort at the lowest speed.

\* A paper read at the 204th meeting of the New York Electrical Society, New York City, March 22, 1900.

Again, the fact that you can greatly overload them both for short periods, is common only to these two powers. Under these conditions we do not require any changes of gearing in the electric automobile to alter the speed, or to climb a grade, but accomplish this electrically by a series of switches, so grouped as to be operated by one handle, and which I shall designate hereafter as the controller. From this controller wires lead to four groups of batteries, and to the motor or motors as the case may be. At this point I will state that there are a number of different arrangements for varying the speed of electric automobiles, but I think that this one is the best, and most commonly used, and a description of this method of speed regulation will be of more interest and value to you. As the speed of an electric motor depends upon the pressure of the current supplied, you will at once see that change of pressure means also change of speed. This pressure, in technical language, is called voltage. As it is necessary when re-charging the batteries to connect them to a direct current. each cell requiring about 2.5 volts, and as the prevailing pressure is in the neighborhood of 110 volts, it is necessary, if we desire to charge economically, to use from 40 to 44 cells of battery. These are placed in four crates or boxes, each holding ten cells. The cells in each crate are connected in series, that is to say, the positive terminal of one is fastened to the negative terminal of the next. As the pressure of a cell on this charge is about two volts, and there are ten in a crate, the pressure at the terminals of each crate is approximately 20 volts. Now it is possible to so connect the four boxes that we obtain three pressures, namely, 20 volts, 40 volts and 80 volts. The controller changes the connections of the four sets of crates, and enables the various pressures to be supplied to the motor. In the first position the four crates are connected so that the motor receives a pressure of 20 volts. As they are now connected in multiple, each crate furnishes one-fourth the total current; for example, if the motor takes 20 amperes, each box is furnishing five. This arrangement allows all of the cells to discharge at the same This method of control has another time. very advantageous feature. If one of the crates should show signs of being discharged before the others, by leaving the controller in the first position for a short time, the other crates will charge the weak one, and save those cells from over-discharge and possible injury. In the second position of the controller, the crates numbers 1 and 2 are connected in series, as are also crates 3 and 4. These two sets are then grouped in multiple and furnish a pressure of 40 volts to the motor. In this second arrangement only one-half of the total current is supplied from each crate; therefore if the discharge is as before, 20 amperes, each crate or box is furnishing ten. In the third position we have the greatest pressure we are able to produce. In this position all the crates are connected in series, and the pressure supplied to the motor is 80 volts, and the total current of 20 amperes is furnished by each crate.

You see that by the above combinations we are able to produce three pressures, which correspond to three different speeds of the carriage. Of course, it is possible to increase the number of speeds by using more than four crates. For instance, six crates will give four speeds. But experience has shown that three speeds are sufficient and have been adopted as

a standard arrangement for electric vehicles. These speeds are about as follows: First position, from 0 to 3½ miles per hour; second, from 3½ to 7 miles per hour; third, from 7 to 14 miles per hour. It is also possible to have these three speeds for backing, but practice has shown that two are sufficient.

I now show you the complete controller and the lever for operating it. When you remember that the forward and reverse speeds, as well as the shutting off of the supply of power to the motor are all done by this one lever, you can see how easy it is to operate an electric carriage. For instance, you take your seat, placing one hand on the steering bar and the other upon the controlling lever. The most natural thing to do is to push the lever in the direction you wish to go. If you desire to go ahead, the lever is pushed in that direction, and the carriage immediately responds, without jerk, jar or noise. Wishing to increase the speed, you push the handle further, and the carriage responds. When you wish to stop, what more natural than to pull the lever back and apply the brake. Now, you may wish to back your vehicle. By pressure of your thumb, you release a catch that prevents accidental reversal and pull the handle back. The carriage immediately goes backwards. Nothing could be more simple or easier to operate, and I think that in this you will agree with me.

As it is necessary to know how much electricity we have stored up, and how fast this is being consumed, we use a combined volt and ampere meter. I think at this point it would be well to explain that the difference in pressure between a fully charged storage cell and the same discharged, is about three-tenths of a volt, being two volts at the beginning and 1.7 volts at the end of the discharge. With 40 cells, the pressure at the start is 80 volts, which falls gradually to 68 at the finish. meters are therefore marked in this manneropposite 80 volts the word charged is written and discharged against 68. You can therefore spin along at ease until, while running on a level stretch of road at a normal discharge, your meter reads 75 volts. You know then that you have used half your charge, and that you must either return or find some means of recharging. This device has been in constant use for over three years, and I have never known anyone to run out of a charge if they went by the reading of the meter. I have so far explained only one side of the meter, and how it operates on discharge or the running of the carriage. It has still another function. When a storage battery is connected to a source of current to be recharged, the back pressure of a cell is about 2.1 volts, making the 40 cells require 84 volts to recharge them. As they absorb the charge, their pressure gradually rises to 2.5 volts per cell, or 100 volts for the 40 cells, at which pressure the charging should be stopped, as the battery is full. The meter also indicates this condition. As it is also necessary to know at what rate to recharge the cells, the other half of the instrument is graded in amperes. This portion of the meter has a double scale, reading either the amount of current going into or out of the battery, enabling us to charge at the proper rate for the best results. to the battery, and when running, shows the amount of power being used. It is therefore possible with an electric carriage, and one of these meters to know at any time just what horse-power you are developing.

As it is absolutely necessary in recharging a battery to connect the positive terminal of the

tattery to the positive charging wire, and the negative battery terminal to the negative wire, some means must be devised making it impossible to connect them incorrectly. This can be accomplished in a number of ways. The one that has been most generally adopted consists of two parts, the socket, which in practice is fastened to the carriage and the positive and negative battery wires being attached to the two rings, the outer of which is positive and the inner negative. Fitting this socket is the plug which is connected by a flexible cable to the source of current for charging. This plug consists of two concentric tubes which encircle and make contact with the rings in the socket. You will therefore see that to recharge, it is only necessary to insert the plug in the socket, and close a switch, it being impossible to connect the charging wires incorrectly.

A crate of batteries, four of which constitute the equipment, are provided with handles, so that they can be easily removed from the vehicle, and making it possible, by having two sets of batteries, to keep the carriage in constant service. The wires from the controller connect to these crates and are clamped by the thumb-screws at the end of the crate, making it possible to take out an exhausted battery and replace it with a fresh one inside of five minutes. A motor, the apparatus that transforms electric into mechanical energy and propels the carriage is probably the most perfect of any power transforming device, having an average efficiency of 80 per cent. and especially adapted to vehicle propulsion, exerting a continuous rotary effort, capable of being overloaded from 100 to 300 per cent., and responding to every call made upon it. Noiseless and without vibration, it is and always will be the ideal motor for automobiles.

As you all know, when turning a corner, one wheel of the carriage must travel faster than the other. This can be accomplished in several ways with the electric automobile. This is what is called the single motor running gear, and the differential action of the wheels is accomplished by the well-known method of making the driving axle in two parts, each half being keyed to a wheel and connected to each other by a system of gears. This arrangement is generally used for light carriages. Here is an entirely different method of obtaining the same effect. In this arrangement, the differential and single motor is replaced by two motors, each directly geared to a driving wheel. The motors are so connected electrically that the same results are obtained as from the differential gear, that is, if one wheel and motor have to go faster than the other it can do so. This double motor equipment is used mostly for the heavier types of vehicles. Having shown that the electric possesses advantages over all other types of vehicles, why is it that any others exist? It is for this reason, and this alone that the radius of the electric vehicle at present is limited to about 30 miles. If we could increase this radius of action to 90 or 100 miles, what one of you would think for one moment of any other motor? Even the competitors of the electric vehicle admit that its advantages far outweigh its disadvantages. Now let us look at the latter from the standpoint of the gasoline or steam vehicle manufacturer. First, the limited radius of action; second, the excessive weight; thirdly, the short life of the batteries, and finally, the great cost per mile. To refute these statements I have facts which were compiled from actual data. In regard to the radius or action, I will say

that there are on the market to-day electric vehicles capable of making 50 to 75 miles on each charge of the battery, and I have a report of a carriage in France that has covered 108 miles on a single charge. This carriage weighed complete about 2,200 pounds. Further, I believe that inside of six months a light, electric vehicle will be produced, not exceeding 1,000 pounds in weight, that will be capable of carrying two passengers fifty miles on one charge. This disposes of the first two statements. The last two can be brought under one head, as in the cost per mile, the life of the battery must be taken into consideration. It has been published by competitors of the electric carriage that the cost of operation was five cents per mile. This is delightfully vague, as they do not state whether this is simply the cost of current for recharging or if they include in their figure the depreciation of the batteries. However, they have certainly put their estimate at a remarkably high figure. To offset these erroneous statements, I will give you a few facts as to the cost of operating electric vehicles, which data is not theoretical but compiled from actual running expenses of a pleasure carriage. The vehicle that I have reference to and from which this data was obtained, has been in almost constant use since 1897. During this period it has covered over 20,000 miles. The cost for battery maintenance has been \$150, or \$ of a cent per mile. The current, as supplied with the regular Edison Company's rate of ten cents per horse-power hour adds 14 cents per mile, making the total cost 2½ cents actual as against the theoretical statement of the gasoline manufacturer 5 cents per mile.

As these figures just given are based on the present weight and capacity of the storage battery, let us indulge in a little speculation as to what we could accomplish with a battery giving from two to three times the capacity per pound over those in use to-day. As the weight of the battery is about 40 per cent. of the total load carried, and we are designing a vehicle to carry two persons, we will assume that our carriage and its occupants will weigh 1,300 pounds complete. Of this total weight 500 pounds will be in the batteries. Now, our normal speed will be 15 miles per hour. To drive our carriage at this rate requires two horse-power, and as our battery has this capacity for 4.5 hours, it is plainly to be seen that we should be able to cover between sixty and seventy miles on one charge. These figures are based on good macadam roads, with practically no hills. The cost per mile to operate such a carriage would be 1.5 cents with current at the regular Edison rates. I stated this as a supposititious case, but as I have before stated, I expect to see such a carriage in a very short time. I hardly think it necessary to enlarge upon the advantages of the electric automobile, but it is the only carriage that a lady can operate, and it also appeals more to our asthetic taste than any other form of motor.

#### Lord Kelvin's Rail Tester.

Lord Kelvin has invented an ingenious form of trolley rail tester. For making contact on the rails a graduated bar has attached to it two steel contacts. These contacts are provided with terminals which are connected by means of a flexible wire to a voltmeter. The latter is located in a box provided with carrying straps. The indications of the instrument show directly the resistance of a rail bond or section of rail,

THE EVOLUTION OF SAFE AND ACCURATE FUSE PROTECTIVE DEVICES.\*

#### BY JOSEPH SACHS.

#### (Concluded from page 215)

OPERATIVE PRINCIPLES OF ENCLOSED FUSES

The satisfactory operation of an enclosed fuse is based on a careful consideration of the following:

- 1. The character, size and form of the fusible strip.
  - 2. Length of active fusible strip.
- 3. The character and mass of the fuse environment.
- 4. The interior section and length of the enclosing easing.

To these may also be added the necessity for indication, compact size and facility of manipulation and low cost.

The character of the metal employed is of the greatest importance, since the heated gases and pressures consequent upon the disruption of the fuse in the casing, and the tendency to arc and explode, is governed by the mass of metal to be disrupted at any particular current condition and voltage, and the conducting nature of its vapors.

The commonly used lead-tin alloy fuse metals by no means possess the desired characteristics. It is true that fuses composed of such metals do not, on disruption, give rise to as highly conducting vapors as copper; but owing to their comparatively poor conductivity and low melting point, they essentially must embody a large mass of metal in any fuse of given length, due to the ample section required. The severe oxidation of such fuse alloys and the possible change in molecular structure of alloys of this type subjected to repeated heating and cooling must not be overlooked.

The search for a satisfactory fuse metal seems now to be directed toward such metals as aluminum, cadmium, tin, zinc and those of a similar nature, or their alloys. A simple metal is, however, more desirable for this purpose, unless the alloy possesses features which cannot be obtained otherwise. Since the desired metal must be cheap, aluminum and zinc at once become most attractive. Both possess the desired conductivity, and melting point and their vapors have the desired high-resistance property, which is, no doubt, due to their extremely rapid oxidation. The mass of metal used in fuse wires of either of these is therefore small, and the opening of the arc is readily accomplished. These two metals have up to date been generally adopted in the writer's various forms of fuse devices, but it is still desired to further advance in the direction noted. Since the carrying capacity of the wire depends upon its ability to throw off more or less of the heat generated therein, it necessarily follows that a single round sectioned wire does not attain the desired goal in regard to the use of a minimum mass of metal. The simplest solution is to flatten the fuse strip and thus raise its heat-throwing-off ability to a maximum. Another method is to construct a fuse strip of a multiplicity of wires. The first method is used by the writer in all larger fuses exclusively, and performs another function which greatly adds to the operation of the enclosed fuse and permits the use of smaller tube sections. In . order to effect a thorough and rapid commingling of the ruptured wire and filling material, it is essential to bring the maximum metal sur-

<sup>\*</sup> Abstract of paper read at the 141st Meeting of the American Institute of Electrical Engineers, New York, March 28, 1900.

face in contact with the filling, which is very well attained by the use of a flat strip.

In fuses intended to work on the various commercial voltages it has been the practice to vary the length of the fuse strip in proportion to the voltage. Owing to the decreased carrying capacity of any particular fuse wire section due to increased length, it is highly advisable to reduce the latter to a minimum, consistent with satisfactory working.

The varying severity of short-circuit effects at different parts of the conducting system with large and small generating capacity and with varying conditions of output and character of service, are frequently ignored in considering the operation of protective appliances of this nature. With heavy current capacity protective devices a very small retarding medium greatly affects the operation of the protective device. Short-circuits and heavy over-load ruptures, on large over-compounded and low-power factor systems are instances of particularly severe service.

It is, however, only necessary for a protective device such as a fuse to accomplish satisfactory results on the particular service in connection with which it is used. While it is entirely possible to provide a device capable of meeting the most extreme condition, such ability, if entailing additional cost, is unnecessary where the extreme conditions are impossible. The peculiar result obtained in a recent test made by short circuiting two of these solid packed fuses on a 2,500-volt line and two exactly similar fuses on a 500-volt line, will illustrate the fact that the voltage does not necessarily determine the severity of the short-circuiting effect on a fuse of ample dimensions.

The use of inductances in series with large fuses to choke heavy current rushes and thus ease the blow on short-circuit, has been suggested. Recent tests with 600-ampere fuses on a very heavy feeder at a short distance from one of the largest 500-volt direct connected railway stations, has somewhat lowered the writer's opinion of this buffing device. One of these fuses tested without the inductance and thrown directly as a short-circuit across the feeders worked in a far superior manner to another having an inductance of about twelve turns in series with it and similarly treated. Indications seemed to warrant the conclusion that while the inductance may have choked the maximum rush, it, however, increased the potential of break across the fuse terminals.

Another important feature dependent upon the length of fuse, its consequent resistance and amount of energy dissipated therein, is the temperature attained by the surface of the tube casing. This depends upon the amount of heat delivered from the fuse to the environment and consequently upon the amount of energy dissipated in the fuse for any particular current. A simple arrangement of the strip section, small in the center and increasing toward the terminal wires, accomplishes most excellent results in this direction. Fuses so constructed have a far lower tube surface temperature than when an even strip is employed, although more metal must necessarily be dissipated.

The desired result as to so-called hot and cold blowing of the fuse device is accomplished by reducing the mass of environment to a minimum. It is obvious that with a certain fixed heat-throwing-off capacity in the wire, the current carrying capacity of the latter will depend upon the rate of heat conduction to, and dissipation by radiation from the tube surface, and

by conduction longitudinally through the terminal wire and environment to the contact posts. The heat conductivity of the environment therefore governs the varying capacity of the complete device, but this function is decreased if insufficient environment section is provided, so that the radiation and conduction therefrom, owing to lack of tube surface, is not in the proper proportion to the amount of heat thrown-off by the conductor. The exterior surface temperature of the tube, other conditions being fixed, is certainly dependent upon the surface area. Decreased surface temperature can therefore be obtained by increased surface area, but this necessarily entails increased mass which is not desirable, for reasons already given. For similar reasons it is desirable to minimize the heat conduction from the fuse to the contacts, through large terminal wires.

By a careful adjustment of the various parts the writer has obtained comparatively low surface temperature, minimum ratio of hot to cold blowing time and practically no difference in the current carrying capacity of the fuse strip, from that which it has when entirely surrounded by an air environment.

To produce the desired result relative to the prevention of any holding of the wire in a molten condition, a very careful experimental investigation was undertaken. Based on the original conception, the writer has developed a combination of elements which not only combine under heat action of the current, but in which the character of all or a portion of the environment is such that the retention of the wire continuity after melting temperature has been reached is impossible. This result is accomplished by the use of a material around the wire which readily fluxes with the metallic oxides of the temperature at the molten metal. Various substances are available for this purpose, but the writer has found mixtures in the form of loose, finely divided powders, in which borax is included as an element most desirable. With the metal employed in the fuse strip, this environment produces most peculiar results, causing a fluxing only upon the attainment of the temperature reached by the wire in its molten overloaded state.

By the use of such combining material around the fuse strip, other features of advantage are obtained. The combination between the metallic oxides with the environment absorbs the energy of any destructive arc or resulting explosive effect, which may tend to maintain itself under other conditions. The combination of the elements in the manner described is, however, equally as valuable in buffing the break, as a long continued and gradually lengthened arc. The merging together of the metal of the fuse strip and material of the environment necessarily causes a gradual increase in the resistance of the structure between the terminals, which is obviously, in order to make the device operative, a gradation from the practically negligible resistance of the intact wire to the absolute break resulting after a complete combination has been affected, and the metallic strip turned into a non-conducting mass.

By no means is the mere fact that an enclosed fuse stands the explosive action of interior rupture sufficient to attest its satisfactory operation under every other condition. After the explosive effect has been subdued or eliminated, the fuse is then subjected to the entire potential of the circuit ruptured. Unless the break is then free from any conducting

quality under that particular potential a very slight leak may still be sufficient to result in a heating effect which soon causes afresh a most severe arcing, and the destruction of the entire device. It is for this reason that the condition following a short-circuit, if carried without destruction by the fuse, is sometimes not as serious a test as a gradual slow arcing break, although the instantaneous shock to the fuse is far more severe in the former case than in the latter.

Whether or not the complete enclosed fuse will stand severe short-circuit shock also depends to quite an extent on the centering of the wire rupture approximately midway between the ends of the tube, so that its resulting effect may work against sufficient filling material and fusible metal on each side.

THE OPERATION AND USE OF ENCLOSED FUSES.

The desirable time-interval function in properly constructed enclosed fuses gives to this form of fuse protective device a decided advantage, owing to the variation and adjustment of the overload time-interval which can be obtained by very simple alterations in the construction. In standard fuses of the ordinary commercial voltages the following adjustment has been adopted:

220 volts below 20 amperes will carry 25 per cent, overload for 10 to 20 seconds..

220-volts above 20 amperes will carry 25 per cent. overload for 25 to 40 seconds.

500 volts below 20 amperes will carry 25 per cent, overload for 15 to 30 seconds.

500 volts above 20 amperes will carry 25 per cent. overload for 30 to 60 seconds.

2,500 volts below 10 amperes will carry 25 per cent. overload for 10 to 20 seconds.

2,500 volts above 10 amperes will carry 25 per cent. overload for 30 to 45 seconds.

These overload time-intervals may perhaps appear small for certain classes of service, but in arranging and adopting a standard overload time for all fuses of a certain voltage, it was essential that an average time-interval be taken, and not one only adopted to some one particular class of service. Special fuses are, however, constructed with any desired time-interval.

The writer has constructed and operated fuses of the type described, ranging in capacities up to 5,000 to 10,000 volts and 30 amperes and 500 volts with 600 amperes continuous running capacity, but is prepared with data already in hand to furnish similar devices up to 1,000 amperes on 220 or 500 volts and 50 amperes on 10,000 volts. These fuses are all constructed so as to singly open circuits up to 2,500 volts.

It has frequently been suggested that for protection on high potentials a number of lower potential fuses in series might be available. Such an arrangement is, however, defective, owing to the fact that under conditions of short-circuit rush the shock may be so instantaneous that the disruption of one of these fuses may precede the other. Such condition will frequently act disastrously upon the particular fuse called upon to stand the first blow, which, until shared by another fuse, involves the opening of the total energy of the short-circuit.

On a similar basis the use of several fuses in multiple has been suggested where one fuse having the total aggregate capacity was not available. Such multiplying of comparative low resistance paths necessarily requires the greatest accuracy in adjusting the resistance of each so that division of the current may be equally shared. The impracticability of doing

this is obvious, and it is for this reason and others that this arrangement is discouraged, and every attempt made to produce a single self-contained tube, having the carrying capacity desired, and capable of working satisfactorily under all required conditions. The shunting of ordinary circuit-breaking devices by a proper enclosed fuse is an excellent arrangement and permits of most extensive application. All arcing can in this way be eliminated and breaking appliances may then be used at much higher potentials than these for which they are adapted alone.

Aside from the particular constructions noted, which are particularly applicable to fuses for electric lighting, power and similar services, the writer has developed another new type of fuse for delicate work. In this direction it has been possible to obtain accurate and safe fuses having a rating of .01 of an ampere, and which blow in 15 seconds at .02.

#### CONCLUSION.

In describing and discussing the various features of the new device of which this paper particularly treats, the writer does not intend to imply that perfection has been reached, nor that the device in its present condition is capable of meeting every possible condition of unusual service. It is, however, believed that the principles herein discussed are based on good foundations, and that similar devices constructed on these lines can be built, capable of accomplishing the results heretofore impossible with the types of fuse and other protective devices in common use. With the introduction of higher potentials in every direction, and the desire to improve the safety factor of electrical service to the utmost, it is believed that the enclosed fuse protector is essentially a necessity, and its entrance into the electrical practice of the present, is undoubtedly but the beginning of a perhaps universal application.

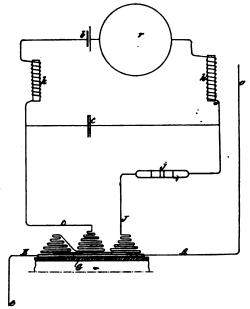

#### A Smoke-Consuming Furnace.

A German inventor, Mr. Paul Cornelius, has introduced a furnace in which the smoke produced by the burning of bituminous coal, wood, peat, or other such like fuels, is perfectly consumed, says the "Engineer and Iron Trades Advertiser," of Glasgow. In addition to this, the furnace can be made to burn inferior fuel such as culm, and generate with it intense heat. In the trials that have been made the efficiency of the furnace has been proved, and it has aroused observation and inquiry in Germany, where its use is said to have sustained the claims of the inventor. The construction and mode of action of the furnace are as follows: A forced draft is produced by a fan worked with an electric dynamo of half a horse-power. The air is slightly compressed by the fan, so that it produces strong air jets through the fire. The air is conducted from the fan to a heating chamber and from there to the fire bars. These bars are tubes closed at one end and connected at the other with a box chamber from which they receive their hot-air supply. To diffuse the air through the fire in such a way as to make active combustion proceed in every part, three rows of perforations for air jets are made along the tops of the bars and so placed that the jets of the side rows make an angle of 60 degrees with those of the middle one. The transverse section of the fire-bar tubes is, therefore, peculiar, their bottom sides being semicircular, while the top ones are hexagonal. To make the delivery of air into the fire sufficient for combustion in every part, the perforations at the front ends of the fire bars are made much smaller than those at the inward ends, as otherwise little of the air would enter the inner ends of the fire.

#### Three Marconi Patents Issued.

Three United States patents were issued on April 10 to William Marconi, the well-known wireless telegraphy expert. All these inventions have been assigned to the Wireless Telegraph & Signal Company, Limited, of London. The following is one of the principal claims of the invention:

"In a receiver for electrical oscillations, the combination of an imperfect electrical contact, a local circuit through it, an induction coil, the primary of which consists of two wires connected in parallel wound in four layers, the

MARCONI RECEIVER.

first and second layers being formed of one wire and the third and fourth of the other, the secondary of which consists of several layers, the number of turns in the outer layers being less than those next the primary and wound unsymmetrically with a lump at one end, a capacity connected to one end of the primary, a conductor connected to the other end, connections between the ends of the imperfect contact and the ends of the secondary, and a condenser in one of the latter connections."

#### A New Telephone System Tested.

In the presence of a small party of capitalists a demonstration was made last Saturday at Freeport, L. I., of what is known as the Smith-Vassar telephone system, which is now in operation there over a small circuit, with about twenty subscribers.

The advantage of this system lies in the limited number of wires required. In the system now generally in use two wires are run from the central office to each subscriber—that is, of course, where complete metallic circuits are used—so that in a section of 100 subscribers 200 wires are necessary.

By means of the new system, it is said by the inventor, forty wires at most will accommodate all the 100 subscribers, and at the same time give them more prompt and absolutely secret communication.

Fourteen of the forty wires, for instance, are devoted to a selective calling device, whereby the "central" operator can select and call any one of the 100 subscribers on her particular

section without disturbing any one of the other subscribers thereon.

The remainder of the forty wires on such a section would be used exclusively for telephoning purposes. The number of such telephoning wires may be made more or less, in accordance with the business needs of each particular section.

A subscriber wishing to establish telephonic connection with any other subscriber merely takes down his receiver from its hook. By this operation he automatically and promptly selects the first pair of the ten pairs of wires which happen at such moment to be idle, and by so selecting this pair of idle wires he secures them absolutely for his own operation, and at the same time, by this action, calls or signals the central operator, in no manner, however, interfering with the other wires.

Should nine out of ten pairs of wires be in use by the other subscribers, which would be unusual, the connection for the particular subscribers would be over the tenth, or idle, pair.

The "central" operator, seeing the signal, and learning the desired connection (say in the same section) calls, over the calling wires, the party desired, who, when he answers the call, automatically selects the next idle pair of telephoning wires, and the two are at once in absolute secret telephoning communication.

When two subscribers have finished conversation and replaced their receiving phones upon their hooks, the pair of wires which they have used become instantly idle and adapted to be instantly secured by any other party desiring to establish communication.

In this way it is asserted that the Smith-Vassar system effects a saving of from 40 to 80 per cent. in construction and maintenance over the prevailing system.

## The New York Electrical Society.

The 205th meeting of the New York Electrical Society will be held at the College of the City of New York, 23d street and Lexington avenue, on Friday, April 20, at 8 P.M. Mr. Albert B. Herrick will lecture on "Electrolysis as Caused by the Electrical Railway Ground Returns"

Mr. Herrick's lecture will include the treatment of the characteristics of corrosive action on buried metal surfaces, when acted on by electric currents flowing from them; the chemical and electrical conditions necessary for this action to take place; testing methods employed to locate these underground currents, and methods employed for the protection of sub-surface conductor systems from electrolytic action.

## Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended April 14:

York, for the week ended April 14:

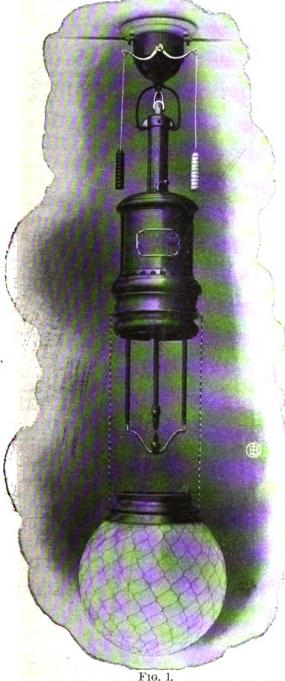

Amsterdam, 10 cases, \$125; Argentine Republic, 80 cases, \$8,066; Bristol, 27 cases, \$2,500; British East Indies, 4 cases, \$155; British Possessions in Africa, 67 cases, \$2,245; British West Indies, 30 cases, \$638; Central America, 54 cases, \$847; China, 1 case, \$15; Christiana, 4 cases, \$80; Cuba, 24 cases, \$514; Dunkirk, 92 cases, \$2,520; Glasgow; 101 cases, \$3,606; Gothenburg, 10 cases, \$4,313; Hamburg, 1 case, \$40; Havre, 222 cases, \$12,137; Havti. 2 cases, \$24; Liverpool, 133 cases, \$10,638; London, 1,952 cases, \$17,735; Manchester, 65 cases, \$4,506; Mexico, 96 cases, \$5,725; Peru, 47 cases, \$1,571; U. S. Colombia, 21 cases, \$292; Vienna, 4 cases, \$18.

## "WOOD" NEW FOCUSING SERIES ARC LAMP.

Over twenty years of experience with electric arc lamps have proven that they are the most economical means of lighting large areas, the cost per actual candle power being very much less than that of any other illuminant. As a result of this economy, and the fact that they can be so easily and cheaply installed and give such universal satisfaction, streets, parks, storehouses, railway sheds, factories, etc., are nearly always lighted by this means.

In the design of a focusing lamp Mr. Wood has maintained that in order to derive the full

benefit from having the arc always at the same point, where it gives a maximum illumination during the full life of the carbons, allowing the use of a ball globe suspended from above, which gives the very best possible diffusion, the acme of perfection would only be reached when the mechanism of any good single carbon gravity feed lamp could be employed without material change to produce this result, requiring the station manager or attendants to be familiar with and handle but one kind of mechanism for either focusing or non-focusing lamps, thereby reducing to one-half the number of

parts necessary to be kept in stock for repairs, etc. In other words, the focusing mechanism should be entirely distinct from and in no sense a part of the feeding mechanism. That the carbons should be focused and held in rigid alignment without the aid of guides, which not only cause them to stick when not of uniform diameter, but when the carbons are not consumed in the proper proportion, burn off, causing the ends to fall over, in many instances short-circuiting the lamp and sometimes destroying it. By abandoning the carbon guides, so common in other lamps, the necessity for the heavy casting close to the arc, absorbing a large percentage of the light and heat emitted from the carbons and causing a heavy shadow at one side of the lamp, reducing its effective candle power, is entirely obviated.

That such devices as counter-weights for causing the carbons to feed, imposing extra work on the feeding magnets; chains, cables and flexible connections to the carbon holders which get tangled up and broken; insulation in the frame work below the arc on which carbon dust and moisture collect, short-circuiting the lamp and causing endless annoyance, are entirely unnecessary is proven by a careful inspection of Figs. 1 and 2, which show the lamp and mechanism as they appear with the carbons consumed, ready for trimming. It will be seen that the lower frame and carbon holders are almost identical with that of an ordinary non-focusing lamp.

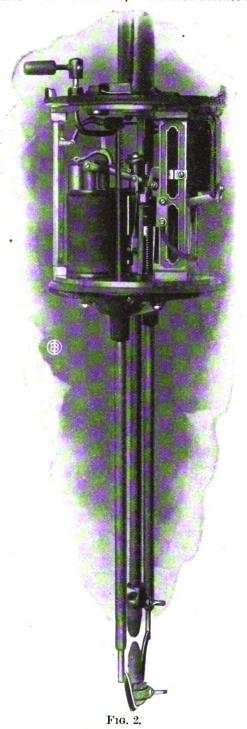

The switch for turning the lamp on and off is located conveniently at the top where it is easily manipulated, and by reference to Fig. 1 it will be seen that a portion of the case slides up out of the way while the globe is being lowered, making the carbon holders easily accessible for trimming.

The positive carbon holder is of a novel design, composed of but two pieces, yet allowing the carbons to be placed in perfect alignment and rigidly held there with the least possible difficulty.

The feeding mechanism of the lamp, clearly shown in Fig. 2, is what is known as the directacting shunt-feed type, and will feed the carbons without readjustment on any direct current series circuit from 6.5 to 9.6 amperes. In other words, the carbons are separated instantly to a full feeding arc by a small magnet of novel construction in the main circuit, which acts directly on the carbon rods without the intervention of springs or other devices. As a result of this arrangement the energy required by this magnet to perform its functions is reduced to the smallest possible extent, it absorbing but from 3 to 6.5 watts, depending on the candle-power; while the shunt or feeding magnets are so proportioned as to be capable of moving the armature through its entire range with a maximum variation of but 3 volts; and as this range includes not only the feeding point, but also the point at which the lamp cuts out, it will be seen that the lamp must always feed and cut out within 3 volts of what it is adjusted for. This armature and its retractible device are so proportioned that as it is attracted into the magnets the power required rapidly diminishes in almost the same proportion as the power of the magnet is diminished, due to the shortening of the arc; and as a consequence the feeding of the carbon is hardly perceptible with a voltmeter. The adjustment of the arc is accomplished by turning a small thumb-nut, tightening or loosening a spring which is carefully protected from mechanical injury.

The clutch for feeding the carbons is of an entirely new design, and what is known as a five point clutch. The advantages of this clutch can only be appreciated after use, as it is self-cleaning and absolutely non-stickable, while at the same time it affords extra large surfaces for wear. It is mounted in such a manner that the weight of the feed rod is always borne by the magnets, and the point at which the clutch releases can be adjusted by raising or lowering the stop with which the clutch lever comes in contact.

Another important feature noticeable in the mechanism of this lamp is the total absence of

the usual cut-out magnet, so common to most lamps. This magnet, with its windings included in both circuits, shunt and series, and its armature and contact points, has always been a source of great annoyance, principally due to the contact points corroding and sticking, causing the lamp's failure to light, or the current short-circuiting from the fine wire to the coarse wire coils, destroying both. In this lamp the cut-out mechanism is a decided departure from the old methods heretofore

in use, and is constructed with a double set of contacts, which are brought together one set in advance of the other by the combined action of the feeding and separating magnets. The first set of these contacts is faced with coin silver, enabling the lamp always to cut-out at the same voltage. They short-circuit the main or separating magnet, allowing it to drop its armature, thereby closing the second set or large contacts and cutting out the lamp. This action jars the mechanism and has a strong tendency to force the carbons together and cause the lamp to relight. As the first set of contacts cannot open until the final set is closed, the operation of this cut-out is sparkless. In addition to the foregoing there is an auxiliary cut-out which automatically short circuits the whole lamp when the carbons are consumed, thereby saving the energy absorbed in the mechanism.

This type of lamp is manufactured by the Fort Wayne Electric Works, Fort Wayne, Ind.

#### CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Railway Committee of the Ontario Legislature has passed a bill fixing the rate of fare on electric railways in the province at two cents per mile.

The council for the town of Ingersoll, Ont., has decided to grant a railway franchise to the Ingersoll Radial Electric Railway Company.

Mr. W. T. Stewart, electrical engineer of Toronto, Ont., has submitted his report to the council for the town of Toronto Junction, Ont., regarding the required changes in the lighting system of the town. It is expected that some action will be taken at an early day by the council towards the installation of a new electric light plant.

#### Niagara Falls Power Development on the Canadian Side.

The agreement between the Ontario Power Company of Niagara Falls and the Commissioners of the Queen Victoria Niagara Falls Park was signed by the Canadian authorities Wednesday, April 11. This is the end of a long and bitter opposition by the American company to the rights asked for by the Ontario company.

The charter of the Ontario company was granted by the Dominion government several years ago, and the approval of the agreement by the Ontario government completes the franchise for the development of 300,000 horse power or more on the Canadian side of Niagara Falls. To the personal efforts of Banker R. Paine, of Niagara Falls, Ont., and Arthur C. Denniston, of Philadelphia, during a period of six years, is largely due the successful issue of the negotiations.

The estimated cost of the entire development of 300,000 electrical horse power is \$10,000,000. The plan is to bring water from a point where the Welland River empties into the Niagara by a canal to the bluff below the Dufferin Islands, where under a head of 45 feet the first development of 60,000 horse power will be made. Thence the water will be carried by an open canal through the park to a point just below Table Rock, where under a head of 160 feet, 240,000 horse power will be devel-

The company's plans contemplate the immediate commencement of development work. A capacity for 60,000 horse power will be the initial development at a cost of \$2,000,000. This will be increased to meet the demand up to 300,000 horse power or more. Negotiations for power are in progress with many large electrolytic industries and an immense steel plant. Locally, there is a large demand, and also a prospect of transmitting power to Toronto, Hamilton and Buffalo.

The officers of the company associated in this great enterprise are prominent citizens of Buffalo. J. J. Albright is president: Gen. Geo. S. Field is vice president, and in charge of the active management of affairs. Their associates on the directorate are: Edmund Hayes and Franklin D. Locke, Buffalo; Henry C. Symmes and Banker R. Paine, Niagara Falls, Ont.; W. M. German, M. P., Welland, Ont., and Arthur C. Denniston, Philadelphia.

#### PERSONAL MENTION.

Mr. R. C. Truax has severed his connection with M. P. Osborne at the electric light station of Camden, N. Y., and will accept the superintendency of the electric power plant at Thousand Island Park.

Mr. W. R. Benson, formerly general manager for the Easton (Pa ) Consolidated Electric Company, has accepted a similar position with the New Hope & Doylestown Electric Railway Company.

Mr. William B. Chapin of Springfield, Mass., has been appointed general manager for Hampden County of the Hampden Automatic Telephone Company.

Mr. Fred Stewart of Pontiac, Mich., who was acting superintendent of the Detroit & Northwestern Electric Railroad, died suddenly at his home a short time ago.

#### INCORPORATIONS.

The San Antonio Gas & Electric Company of San Antonio, Tex. Capital stock, \$200,000.

The Columbus Light & Power Company, Columbus, Miss. -to erect an electric light and gas plant. Capital stock, \$50,000. Incorporators: W. H. Johnson and others.

The Ulua Commercial Company, Philadelphia, Pa.- to engage in transportation, mining, constructing and electric lighting in Honduras, Central America. Capital stock, \$500,-

The Lacombe Electric Company, Denver, Col.—to erect an electric plant. Capital stock, \$1.000.000. Incorporators: C. F. Lacombe, W. S. Bagot, Z. T. Hill, F. Dorr, M. L. Stern, H J. O'Brien, all of Denver.

The Ottumwa Electric & Steam Company, Ottumwa, Ia. to construct and operate street railways, Capital stock, \$350,000. Incorporators: J. H. Merrill, J. B. Sax, J. W. Garner, all of Ottumwa.

The Hampton Roads Railway & Electric Company. Newport News, Va. Capital stock, \$500,000. Incorporators: A. H. Martin, W. J. Nelms, R. W. Shield, C. F. Day, T. W. Shelton, G. N. Wise J. P. A. Mottu, J. S. Wise; all of Newport News.

The Electrical Construction Company, Portsmouth, Va .to construct and equip for the Federal or any State Government railroads, wharves, bridges, power plants or power transmission lines. Capital stock, \$40,000, with the option of increasing it to \$100,000. Officers: President, Powell Evans: vice-president, Axel H. Engstrom; secretary and treasurer, Magnus Hellstrom.

The Agamenticus Light & Power Company, York, Me.-to construct and operate an electric light plant. Capital stock, \$50,000. Incorporators: E. S. Marshall, J. P. Bragdon, J. P. Putnam, J. C. Stewart, all of York, and F. D. Marshall of

## ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W , Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED APRIL 10, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

647,030. Car-Fender. Timothy A. Remsen, New York City, assignor to Mary E. Remsen and Elizabeth Ann McGuire. Filed May 27, 1899.

- 647,079. Car. Fender. John Currie, Montreal, Can. Filed July 15, 1889.
  647,083. Car. Fender. George L. Gehrig, New York City. Filed July 21, 1899.
  647,067. Railway-Signal. John Jorgensen, San Francisco, Cal. Filed Aug. 22, 1899.
  647,142. Brake Mechanism for Electric Cars. Uldereque E. Maille. Providence, R. I. Filed Dec. 29, 1899.
  647,193. Trolley. James B. Lynch, Waverly, and George B. Griffin and John A. Simpson, Elmira, N. Y. Filed Sept. 2, 1899.
  647,299. Automatic Signal Apparatus for Railway-Crossings. George A. Vice, St. Mary's, Ontario, Can., assignor of two-thirds to William James Gilpin, same place. Filed Oct. 31, 1899.
  647,224. Indicator for Railways. Richard H. Forde, New York City. Filed June 9, 1899.
  647,454. Electromagnetic Traction Apparatus for Street-Cars, George N. Moore, New York City. Filed May 24, 1899.

#### ELECTRIC LIGHTS AND APPLIANCES.

- ELECTRIC LIGHTS AND APPLIANCES.
  647.631. Electric-Arc Lamp. Josef Rosemeyer, Lingen-onthe-Ems. Germany. Filed May 31, 1899.
  647,155. Automatic Switch for Electric Car-Lighting Apparatus. Willard F. Richards. Buffalo. N. Y., assignor to
  Charles M. Gould. New York City. Filed June 5, 1899.
  647,184. Electric Headlight, William S. Hamm. Chicago, Ill.,
  assignor to the United States Headlight Company, Buffalo, N. Y. Filed Jan. 17, 1990.
  647,219. Electric-Arc Lamp. Walter J. Cochran, Le Roy.
  N. Y., assignor to David J. Bissell, same place. Filed
  Oct. 21, 1899.
  647,434. Electric-Arc Lamp. Royal E. Ball, New York City,
  assignor to the Ball Electric Company, Yonkers, N. Y.
  Filed May 22, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

- ELECTRICAL MACHINERY AND APPARATUS.
  647,168. Safety Appliance for Electric Circuits. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Jan. 18, 1899.
  647,210. Electromagnetic Engine. Peter B. Watson, Philadelphia, Pa. assignor of one-half to George W. Carver, Boyertown. Pa. Filed March 8, 1899.
  647,254. Contrifugal Electric Switch. Edouard Cros, Paris, France. Filed Dec 6, 1890.
  647,414. Electric Switch. Watter F. Jones, London, Eng. Filed Feb. 6, 1900.
  647,436. Au omatic Brake for Electric Motors. Mathias A. Beck, Milwaukee, Wis., assignor to Pawling & Harnischfeger, same place. Filed Jan. 9, 1899.

#### TELEPHONES AND TELEPHONE APPARATUS.

- TELEPHONES AND TELEPHONE APPARATUS.
  646,963. House Telephone System. Frank M. Dunn, Baltimore, Md. Filed Dec. 17, 1898.
  647,300. Telephone Signaling System. Newman H. Holland, Prookline, Mass., assignor to the Holtzer-Cabot Electric Company of Massachusetts. Filed Oct. 9, 1899.
  647,307. Combined Telephone Exchange and Fire-Alarm System. John M. Latimer, Philadelphia, Pa... assignor to the United Pneumatic Fire Alarm Telegraph Company of New Jersey. Filed July 3, 1899.

#### MISCELLANEOUS.

- 646,948. Press for Molding Insulators. Henry M. Brookfield and Seraphin Kribs. New York City, assignors to the Brookfield Glass Company of New York. Filed May 7, 1808

- and Seraphin Krids. New York. Act, acceptance of Brookfield Glass Company of New York. Filed May 7, 1898.

  646,949. Press for Molding Insulators or Similar Articles. Henry M. Brookfield, New York City. Filed Feb. 23, 1899.

  647,006. Special Apparatus for Electric Baths. Antonio Maggiorani, Rome, Italy. Filed Dec. 31, 1897.

  647,007. Apparatus Employed in Wireless Telegraphy. Guglielmo Marconi, London, Eng., assignor to the Wireless Telegraph & Signal Company, Limited, same place. Filed June 13, 1899.

  647,008. 647,009. Apparatus Employed in Wireless Telegraphy. Guglielmo Marconi, London, Eng., assignor to the Wireless Telegraph & Signal Company, 1 imited, same place. Original application filed June 13, 1899. Divided and this application filed Dec. 26, 1899.

  647,008. Secondary Battery. Harold S. Gladstone, London, Eng. Filed Jun. 2, 1990.

  647,101. Battery-Case for Electromedical Apparatus. James H. Mahler and Cleaveland F. Dunderdale, Chicago, Ill.; said Dunderdale assignor to said Mahler. Filed Jan. 2, 1990.

  647,147. Graphophone. Frederick Myers, New York City.

- 647, 101. Battery-Case for Electromedical Apparatus. James H. Mahler and Cleaveland F. Dunderdale, Chicago, Ill.; said Dunderdale assignor to said Mahler. Filed Jan. 3, 1900.
  647, 147. Graphophone. Frederick Myers, New York City. Filed Dec. 15, 1869.
  647, 177. Transmission of Electrical Impulses. Frederick Bedell. Ithaca. N. Y. Filed May 22, 1869.
  647, 177. Storage Battery Tams. Rufus N. Chamberlain, Depew, N. Y., assignor to Charles A. Gould, Port Chester, N. Y. Filed Aug. 19, 1869.
  647, 217. Electrolyzing Apparatus. Antoine J. O. Chalandre, Louis J. B. A. Colas and Charles J. Gerard, Paris, France. Filed March 21, 1869.
  647, 239. Elevator. Frank J. Sprague. New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed July 27, 1898.
  647, 240. Electrically-Driven Mechanism. Frank J. Sprague, New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed July 27, 1898.
  647, 241. Brake for Hoisting Mechanism. Frank J. Sprague, New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed July 27, 1898.
  647, 242. Cable-Winding Safety Device. Frank J. Sprague, New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed July 27, 1898. Divided and this application filed Sept. 20, 1899.
  647, 242. Cable-Winding Safety Device. Frank J. Sprague, New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed Sept. 20, 1899.
  647, 242. Cable-Winding Safety Device. Frank J. Sprague, New York City, assignor to the Sprague Electric Company of New Jersey. Original application filed Sept. 20, 1899.
  647, 251. Storage-Battery Suspension for Motor-Vehicles. George H. Condict. New York City, assignor, by mesne assignments, to the Columbia & Electric Vehicle Company, Jersey City, N. J., and Hartford, Conn. Filed Aug. 19, 1899.

## GENERAL NEWS.

## What is Going On in the Electrical World.

#### LIGHTING.

Alexandria, Va.-The Alexandria Steam Laundry Company, recently incorporated, proposes to install an electric light plant to furnish light, heat and power. F. E. Anderson is president.

Arkansas City, Kan.—The electric light plant at this place, destroyed by fire a short time ago, will be rebuilt at once.

Auburn, B. I.—The people of this place are agitating the question of electric lights.

Brookings, S. D.—This city contemplates the pur-hase of a larger boiler and another dynamo for its electric lighting plant.

Buena Vista, Ga — This city will grant a franchise to any responsible concern that wishes to build an electric light plant. Address C. S. Crawford, Mayor.

Buffalo, N. Y.—At the next meeting of the penitentiary committee of the board of supervisors, Superintendent Sloan, of the penitentiary will urge the committee to take some action toward fitting up an electric lighting plant in the institution.

Burlington, Kan.—C. E. Warner, of Kansas City, is figuring on building an electric light plant here.

Charlotte, N. C.—The Piedmont Realty Company has been incorporated for \$60,000 to build an electric light plant, waterworks, etc. B. D. Heath and W. Coleman are interested.

Chicago, Ill.—An electric light plant will be installed in the Presbyterian Hospital in this city. The com-mittee is composed of Dr. W. R. Notman and Dr. W. J. McCaughan.

Creston, Ia.—The railroad company will put up and operate an electric light plant of its own here.

Devil's Lake, N. D.—The citizens of this town are agitating the electric light question.

Grant's Pass, Ore.—At a recent election it was voted to issue \$69.000 in bonds for the construction of an electric light plant and waterworks.

Greentown, Ind.—The electric light plant here was recently burned, but will soon be rebuilt.

Independence, Mo.—The citizens of this place are agitating the question of erecting an electric light plant. H. H. Pendleton, city engineer, can be addressed.

Ironton, O -The Ironton electric light plant is to be improved.

Johnstown, N. Y.—The matter of municipal ownership of the electric light plant is being agitated here. -The matter of municipal owner-

Manson, Ia.—Mr. Randolph, the new owner of the Manson electric light plant, has taken possession of same and intends to spend about \$4.000 in improving and putting the plant in first-class condition.

Madelia, Minn.-An electric light plant is prejected for this place.

Monroe, La.—The city council has appointed a spec ial committee to collect data, etc., relative to the cost of erecting a municipal electric light plant.

Plano, Tex.—The large corn shelling and electric light plant of J T. Stark & Co., was recently destroyed by fire. Loss \$10,000. The plant furnished light for the city, and will be rebuilt immediately.

Port Oram, N. J.—The Dover Electric Light Company has been awarded the contract to equip the new Ross silk mill here with an electric plant.

Redding, Cal.—F. Hurst and J. Young are interested in a company which proposes to build an electric light plant on the Pit River to develop about 6,000 hp. and to cost about \$125,000.

Shawnee, O.—The Legislature has authorized this town to issue \$25,000 in bonds for erecting an electric light plant. The question will be voted on at the light plant. spring election.

St. Michael's, Md.—The city council contemplates the erection of an electric light plant in the near

The recent election to raise the Weatherly, Pa.money to enlarge the electric light plant here resulted in favor of the plant by a majority of 138 votes.

Williamson, W. Va.—The electric light plant here is to be improved and enlarged.

#### STREET RAILWAYS.

Albany, N. Y.—A meeting of the directors of the Albany, Schoharie & Helderberg electric road will be held April 24, when it is expected that final action will be taken as to the commencement of the road.—It is reported that the officials of the Schenectady Street Reliway Company are planning the construction of an electric road between Schenectady and this city. It is claimed that the matter of routes is now under consid-

Anderson, Ind.—It is announced that the Elwood. Auderson, 11d.—It is announced that the Elwood, Anderson & Lapel Railway, which is in process of construction, will be equipped as an electric road instead of steam. The American Tin Plate Company is building the road with the view of reaching the coal fields of Clay County, Auburn, N. Y.—The Auburn Interurban electric railroad intends to construct its line to Skaneateles this summer, to be operated in connection with the city system which now has control of the suburban fran-chises.

Battle Creek, Mich.—The township board of Burlington has granted a franchise to the Southern Michigan Construction Company for an electric railway to cross the township. The proposed road will run from Battle Creek to Coldwater via Union City.

Bangor, Me.—The Penobscot Central Railroad Company has decided to equip its line with the trolley

Chattanooga, Tenn.—The Chattanooga Rapid Transit Company aunounces that an electric line is to be built up Lookout Mountain and a carriage service instituted through Chickamauga Park.

through Chickamauga Park.
Collegeville, Pa.—Efforts are about to be made by
the Trappe & Limerick Electric Street Railway Company, the control of which is vested in the Schuylkill
Valley Traction Company, of Norristown, to obtain the
right of way through the brough of Trappe and the
townships of Limerick and Lower Pottsgrove, for the
purpose of extending the trolley line from this place to
Pottstown.

Dayton, O.-W. D. Brumbaugh has been making arrangements with J. E. Feight to survey the electric road from Greenville to the Montgomery and Darke county line.

Datroit, Mich —The directors of the Datroit, U(Romeo Railroad have authorized a bond issue of -The directors of the Detroit, Utica & 000 for the immediate construction of the line. M. A. McCarron is interested.

Holland, Mich.—B. S. Hanchett has secured a frechise for his new electric road from here to Z seland.

Indianapolis, Ind.—W. S. Christian, attorney for the Indianapolis and Ft. Wayne Electric Railroad Company, authorizes the statement that the road will be built within the next six months.

Lansing, Mich.—J. T. Mills of Port Huron, and Chicago capitalis's have become interested in the proposed Lansing & Ithaca electric railway. They propose to put up \$300,000 for the construction of the road.

Noblesville, Ind.—The city council has granted the Central Traction Company of Indiana a 40 year franchise to operate an electric street car line in this city. The company agrees to erect a \$200,000 power house near the city limits.

Portland, Me.—A project is on foot in this city to build an electric railroad on Peak's Island.

Port Jervis, N. Y.—W. B. Benson is general manager of the New Hope & Doylestown Bailroad, the length of which will be 12 miles. The power house will be located at New Hope and the contractors will be Philadelphians The capitalists back of the movement are also Philadelphians. It is possible that the road will be continued to Saylorsburg, Stroudsburg, Bushkill, Milford and this place. Milford and this place.

Seymour, Ind.—The board of commissioners of Jackson County has granted a franchise to the Seymour & Southwestern Railway Company, which proposes to construct an electric line from this city southwest to Salem and on to Paoli and West Baden.

Somerset, Ky.—The citizens of Wayne and Pulaski counties have been making an effort to interest outside capital in the building of an electric line from Burnside or this place to Monticello, a distance of about 27 miles. The road would doubtless be a paying investment, as Wayne County is rich in coal, timber and oil.

Springfield, Ill.—The promoters of the proposed electric car line between this city and Sullivan have not abandoned their plaus. Nearly all the right of way has been secured, and a meeting of the men who are pushing the scheme will be held here soon and plans laid for the injection of more energy into the project.

Wilkes-Barre, Pa — The surveying for a new traction railway between Hazleton and this city was recently begun. The line will join with the Lehigh Traction Company's road, at West Hazleton, and run through Conyingham, theuce to Wilkes-Barre via Butler Valley. The length of the new road will be 27 miles. It will be built by Wilkes-Barre and Hazleton people.

### COMPANY MATTERS.

Athens, O.—The Athens Gas & Electric Company will place a new and modern equipment for its electric branch. Incandescent as well as arc lights are to be furnished.

Birmingham, Ala.—The Consolidated Electric Light Birmingham, Ala.—The Consolidated Electric Light Company is about to enlarge its plant. Within the year it will install six new engines, with a maximum combined horse power of 6.000; these engines will be built by the Birmingham Machine & Foundry Company. A new battery of boilers is also to be put in, made by the Birmingham boiler works.

Bridgeport, Conn.—Superintendent J. E. Sewell, of the Bridgeport Traction Company, says that trolley improvements will be made. Cars will be renovated at once, and next season new ones will be obtained.

Delaware, O.—The Delaware Electric Light & Power Company has been changed to the Delaware Electric Light, Power & Heating Company, and its capital stock increased from \$75,000 to \$100,000.

Lewisburg, Pa.—The Central Electric & Foundry Company's plant was recently destroyed by fire.

Los Angeles, Cal.—The Pacific Electric Railway Com-

pany has voted to issue \$200,000 in bonds to be used for improvements to its system. The company will become a part of the Los Angeles Railway Company, and several suburban extensions will be made.

Rome, N. Y.—It is stated on the authority of an official of the Trenton Falls Power Company that that company will be in a position to do business in this city about the middle of next summer, and will be ready to furnish power and light.

Washington, Pa.—The stockholders of the Washington Electric Light & Power Company have decided to increase the capital stock from \$50,000 to \$150,000.

Windsor Locks, Conn.—A plan is being discussed, which if carried out will result in the consolidation of ctric light plants of Windsor Locks, Suffield and

#### MANUFACTURING.

Baltimore, Md.—A company was recently organized here, known as the Baltimore Machine Company for the purpose of manufacturing electric elevators.

Buffalo, N. Y.—It is announced that the project of establishing a plant for the manufacture of an electric automatic switch and signal device in this city is now an assured fact. The men interested in the concern, besides the Chicago investors and promoters are said to include G. D. Morgan, Audrew Langdon, J. P. Bradfield, Charles R Huntley and others.

Cleveland, O.—The Winton Motor Carriage Com-pany has placed a contract for a large quantity of primary batteries with the Nungesser Electric Battery Company, and will use them exclusively, so it is claimed, on 1990 Winton carriages.

Trenton, N. J.—A company recently organized here, known as the Rowland Telegraph Company with a capital of \$500,000, will manufacture telegraphic instruments under paten!s.

#### POWER AND TRANSMISSION PLANTS.

Handerson, N. C.—Col. W. H. S Burgwyn, of this place, and N. D. Wilkins, have made arrangements for and establishment of a \$1,000,000 electric power plant at Pughs Falls on the Roanoke River.

at Pughs Falls on the Roanoke River.

Plainwell, Mich.—A steck company composed of New York and Chicago capitalists is p oj cting the erection of a large electric power plant here.

Santa Fe. N. M.—The machinery of the electric plant of the Cochiti Gold Mining Company at the Madrid coal mines was recently started. From this plant sufficient power and light will be trausmitted 35 miles on copper wires to drive all the machinery of the mills and the mines of the Cochiti mining district and to light the streets and houses of Bland and Albermarle.

#### MINES.

Bingham, Utah—W. H. Nutting, of the Bingham Copper & Gold Mining Company of this place, has completed designs for the new \$2 10,000 pyritic smelter to be erected here. The power plant will consist of motors with an aggregate energy of 3 10 horse power. The smoke stack will be an especial feature, a shaft 12 feet in diameter and 200 feet high.

Durango, Col.—R. J. McCartney, of Silverton, is interested in a stock company with a capital zation of \$500,000, which has been organized for the purpose of supplying electric power and light to the mines of the surrounding sections, including parts of La Plata, San Juan, Dolores and Montezuma counties.

#### AUTOMOBILES

Hartford, Coun.—The Columbia & Electric Vehic's Company of this city has found it necessary to enlarge its factory in order to keep up with the increasing demand for automobiles. The motive power at the main factory will soon be largely increase 1. At present it is derived from electricity furnished by the electric light company, and from a 100 horse power engine at the works; but a new 325 horse power engine and boiler to generate steam for it will shortly be placed in position. Nearly all the vehicles now turned out are propelled by electricity. by electricity.

Newport, R. I.—It is reported that a company has purchased property here and will have laid out a large inclosed area where novices may learn the art of manipulating the automobile under skilled teachers. Already orders have been received for more than one hundred machines of all styles, and several new vehicles will be introduced. The greater number of the automobiles have been ordered for delivery during May.

Delived which is a proper of the automobiles have been ordered for delivery during May.

with the instituted. The glease I humbel of the automobiles have been ordered for delivery during May.

Philadelphia, Pa—Tre Anglo-American Rapid Vehicle Company has been organized with the object of gaining control of all the automobile and traspepration companies of the country. Philadelphia capitalists are largely interested in the new enterprise, and steps are now being taken to amalginus's the various concerts in one gigantic company. W. W. Gibbs, president of the Pennsylvania Electric Vehicle Company, and who is largely interested in the Autorius Company of New York, is president of the Anglo-American Company. The company's charter was issued by the Secretary of State for Delaware at Dover, April 12. The capital stock is \$75.000.000, all of which is common stock, divided it to 750,000 shares of the par value of \$100 each. The incorporators are H. B. Twyford, of Windley, England; Ernest Martin, of New York City, and James Virden, of Dover, Del.

## THE TELEPHONE WORLD.

#### Rival For the Bell Company.

A step toward the organization of a formidable rival of the Bell system in Pennsylvania and adjoining States was taken on the 11th inst, in Harrisburg, by representatives of the larger independent telephone companies. As a result of the conference the independent telephone interests of Pennsylvania and New Jersey are so thoroughly in harmony as to be practically one corporation, except in actual operation. The chief cbject of the conference—the obtaining of a long distance service—will be accomplished without delay,

There are almost a hundred independent telephone companies in Pennsylvania, and all the important companies were represented at the conference. A. M. Worstall, of Philadelphia, secretary of the Interstate Telephone & Telegraph Company, through which corporation, working with the Telephone, Telegraph & Cable Company of America, the long distance service of the Associated Independent Companies will be secured, read a report, showing that the independent companies represent 40,000 telephones in Pennsylvania and New Jersey. Two-thirds of these companies were represented in the conference. He showed that of the sixty-seven counties in Pennsylvania, fifty-seven have independent telephone companies, and of the twenty-one counties in New Jersey eighteen bave independent service. The Interstate Company is constructing a long distance line between Norristown and Trenton, and also between Hazleton and Wilkes-Barre.

These officers were elected: President, C. W. Kline, Hazleton; vice-president, Edward Davis, Philadelphia; recording secretary, H. B. McNulty, Chambersburg; financial secretary, S. H. Browne, Pittsburg; treasurer, Ward R. Bliss, Chester.

## Important Telephone Decision.

By the recent decision of the Appellate Division in Rochester, N. Y., in the action of Wilmot Castle against the Bell Telephone Company, a precedent was established which will gravely affect private and corporate interests. The substance of the decision is that the owner of a fee abutting a highway surrenders to the public not only the right to pass along the highway, but every right in it which may be considered a reasonable street use, and that this use may be so extended in the process of time as to include many new means of passage, made necessary or advisable by the progress of civilization. "The right of free passage," says the decision, "may embrace the transmission of thought and words as a substitute for the actual physical passage of persons over a public highway," of which the court makes practical application by deciding that the purposes of a telephone company are such that it may use a public highway without infringing upon vested rights of abutting property owners.

## No Municipal Plant for This Town.

The voters of Billerica, Mass., have referred to a committee a proposition to have the town lighted by electricity. They rejected a plan to have a telephone plant under direction of town officials.

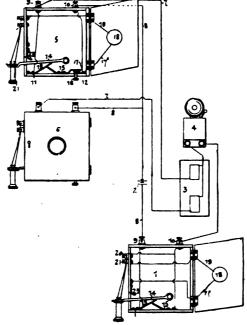

A meeting of the stockholders of the Home Telephone Company of Rome, N. Y., was held in that city recently. Robert Earl, 2d, of Herkimer, presided, and John E. Mason was secretary. These directors were elected: John S. Wardwell, F. M. Shelley, W. J. Grogan, John E. Mason, Robert Earl, 2d, James L. Brailey, Jr., and Edward L. Barber, of Wauseon, O. Messrs. Mason, Shelley and Grogan were appointed a committee to prepare papers to be executed by the stockholders to mortgage the property of the company for \$150,000. At a meeting of the directors the following officers were elected: President, Robert Earl, 2d; secretary, John E. Mason; treasurer, James S. Brailey. The president was authorized to accept in writing the franchise granted by the common council of Rome at the last meeting and to deposit \$1,500 with the chamberlain for the guarantee that the company means business. The contract for building the system was let to the Central Construction Company of Wauseon, O.

The Black River Telephone Company has established exchanges and toll stations at Boonville, Port Leyden, Lyons Falls, Greig. Glenfield, Watson, Beaches Bridge. Lowville, Turin, Houseville, Constableville, Mohawk Hill. West Leyden, Ava, West Branch, Delta, Lee Center and Rome, N. Y. The following connections will be made as soon as possible, for which all material is ready: From Rome to Taberg, to connect with Camden exchange, also other points west from Rome to Lowell, Vernon Center and others; from Rome to Orlskany, Whitesboro and Utica; from Rome to Ridge Mills, Westernville, Northwestern and to Remsen; from Boonville to Forestport, Buffalo Head, Hawkinsville, Alder Creek and Remsen; from Lowville to Crophan. Castorland to Copenhagen, Denmark, Black River and Watertown, and connect with northern independent lines.

#### A House Telephone System.

A patent was issued on April 10 to a resident of Baltimore for a house telephone system, designed to take the place of the old-fashioned speaking tube. The details of the invention may be seen by a glance at the accompanying illustration, which is described as follows:

"In a house telephone system, an annunciator system comprising a bell, an annunciator, and a battery, and electrically connected and in combination therewith, a number of telephones, each telephone having a simple contact transmitter and receiver in series with one another, each telephone except the kitchen-telephone, having a lever-hook for supporting a receiver and a contact with which the receiver

HOUSE TELEPHONE SYSTEM.

engages to close the telephone-circuit, a double-ended spring and a push-button and contact-spring, one end of said double-ended spring engaging a spring engaging the hook-lever when the receiver is supported thereby, and the other end of said double-ended lever being adjacent to the spring adjacent to the push-button, the telephone-circuit being normally open and the signal-circuit being normally open, and the telephone-circuit being closed by the removal of the receiver by the action of the springs aforesaid acting on the hook-lever, and the signal-circuit being closed by the push-button engaging its spring with the other end of the double-ended spring to operate the bell and annunciator."

#### Receiver Appointed.

The Chicago Title & Trust Company has been appointed receiver of the assets of the Western Telephone Construction Company, at 250 South Clinton street, Chicago. The appointment was made by Judge Kohlsaat in the United States Circuit Court, on petition of the Varley Duplex Magnet Company of New Jersey. In a bill filed in court the plaintiff showed that two judgments aggregating over \$5,000 had been entered in its favor against the Chicago Company, whose llabilities are said to amount to more than \$30,000. The receiver gave a bond for \$50,000 in court. The Western Telephone Construction Company was incorporated in 1893, with a capital of \$100,000, of which J. E. Keelyn is said to hold \$90,000 worth. D. A. Holmes is president of the company.

The Pennsylvania (Bell) Telephone Company is to have a rival unless it can prevent the new company from obtaining the consent of Harrisburg councils to erect its poles and wires. The new company will be known as the Harrisburg Telegraph & Telephone Company, and the charter will probably be issued by the State Department April 30. At the head of the competing company is Representative Bliss, of Delaware County, Pa. It is understood that this company will co-operate with the Southern Pennsylvania Company, which has franchises through the Cumberland Valley and other southern sections of the State.

The Brooklyn "Eagle" states that the South Shore Telephone Company operating in Freeport, L. I., has completed the work of installing its experimental line. Nearly 100 'phones have been put in on three months' free trial to test the new system, which has for an advantage the calling of central by merely lifting the receiver from the hooks, no call belis being used.

#### Fazed by Independent Fusion.

A special dispatch to the New York "Commercial," says that a leading officer of the Massachusetts corporation, representative in Boston of the Telephone, Telegraph & Cable Company, which is supposed to be one of the chief organizations opposing the Bell, said in regard to the reported combination, whereby all principal independent companies of Pennsylvania and New Jersey had joined to procure long distance service, that this appeared to be a union of the same interests allied with his company, though he knew nothing about the details. As to his idea of the attitude of the Bell companies, he stated there were evidences enough that the Bell people were seriously disturbed. He instanced a bill pending in the Legislature of Massachusetts as an example of the Bell Company's method of meeting opposition.

"That bill," he asserted, "if passed will not supervise the Bell Compeny in any way; it will supervise only us. It merely is a measure of the Bell interests intended to choke off all new companies by preventing them from getting locations. They have put the same kind of a bill through in Connecticut, and not a new company has been able to start business there since."

He was of the opinion that so far as the independent companies at large were concerned, the Bell Company would find it impossible to absorb them, for the reason that in order to do so it would have to reduce its rates to correspond with theirs. Rates once reduced, he thought, could not be raised to the old high level without such loss of business as would make an increase inexpedient.

#### Hostile to the Bell.

People who continue to use the Bell 'phones in Duluth, Minn., can get no connection with any of the public offices of the city or county except police headquarters, and that only for a few days. County officials have cut all Bell wires in the courthouse and city hall. It is estimated that 60 per cent. of the 'phones of the Bell Company have been cut off. The company is apparently taking no steps to meet the new conditions except by disassociating itself from a manager who had become unpopular by reason of carrying out its policy and by serving an injunction on the city to prevent its tearing out poles and street wires. Since the change in municipal control nobody has expected the city would take any severe steps against the company, but the order of two months ago that it vacate the streets remains on the books.

The New England Telephone Company appears to be having a hard fight on its hands in St. Albans, Vt., against an independent company which has constructed and is operating a modern system in that city with rates of \$20 per year for business places, and \$15 for residences, as against \$30 and \$24, the regular rates of the New England Company. The grocers, meat dealers, druggists, dentists and laundry men in the city, on April 1, after ordering out the instruments of the New England, disconnected them, and are only using the independent line. It is reported that the New England Company is now offering telephones in that city at \$18 per year for a business place with a free 'phone at the residence.

A certificate of the increase of the capital stock of the American Telephone & Telegraph Company of New York City from \$75,000,000 to \$100,000,000 was filed with the Secretary of Sate at Albany, N. Y., on the 11th inst. The amount of capital of the company actually paid in is \$70,975,000, and the amount of its debts and liabilities is \$24,078,431.

A copy of the proceedings for the voluntary dissolution of the Standard Telegraph & Telephone Company was filed with the Secretary of State at Albany, N. Y., on the 12th inst. The company's principal office was in Lowell, Mass., with branch offices in New York State.

#### TELEPHONE INCORPORATIONS.

The Lost Valley Telephone Company, Lost Valley, Ore. Capital stock, \$8,000. Incorporators: A. Hardie, C. W. White, J. Trizzed.

The Keystone Telephone Company, Camden, N. J. Capital stock \$2,000,000. Incorporators: N. Grey, S. S. Izard, both of Woodbury; W. H. Chew, of Camden.

The Snickersville Telephone Company, Snickersville, Va. Capital stock, \$5,000. Incorporators: E. Hawling, C. B. Turner, C. H. Osborn, A. J. Simpson, J. A. Lynch, J. B. Thomas, G. E. Plaster, Jr, H. G. Plaster, A. C. Bell all of Snickersville.

The Farmers' Telephone Exchange Company, Pipestone, Minn. Capital stock, \$100,000. Incorporators: T. F. Robinson, O. Cass, W. Frost, Mary M. Robinson, Elizabeth C. Frost, all of Pipestone,

## NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 17@17½c.; Lake, 17½@17½c.; casting, 16&@17&c.

A gross increase of \$19,914 is reported by the United Power and Transportation Company for March.

The Elison Electric Illuminating Company of Brooklyn has filed a certificate of merger of the Bergen Beach Light and Power Company.

The American Telephone and Telegraph Company will make application to the New York Stock Exchange in a few days to list its new stock.

The Senate at Washington has passed the Hale bill providing for a cable from San Francisco to Honoluiu, and eventually to the Philippines.

It is rumored that the Consolidated Traction Company of New Jersey has purchased the Camden, Gloucester & Woodbury Electric Railway.

A dispatch from Irwin, Pa., s'ates that the Greensburg, Jeannette & Pittsburg Traction Line will be sold under foreclosure of a \$500,000 mortgage at Greensburg May 1.

Kuhn, Loeb & Company of this city announce that the subscription list for the Western Union Telegraph Company  $4\frac{1}{4}$  per cent. bonds has been closed, the amount being largely over subscribed.

Stockholders of the New England Telephone & Telegraph Company will hold their annual meeting May 7, and also a special meeting to consider the increase in capital stock from \$15,000,000 to \$20,000,000.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat,  $26\frac{1}{4}$ ,  $27\frac{1}{2}$ ; New York Electric Vehicle Transportation,  $11\frac{1}{4}$ (2)? New Englan 1 Transportation,  $5\frac{1}{4}$ (2), Telephone & Telegraph Company of America 4(2); Gramophone, 44(2)4.

The United Electric Light and Power Company of Baltimore. Md., has declared the regular annual dividend of  $2\frac{1}{2}$  per cent. on its preferred stock, payable May 1 to stock of record April 25. The company reports for the six months ending April 30 a surplus of \$56,641.

The Philadelphia Electric Company in the last two or three months has steadily shown increased earnings over last year, and the company is now earning at the rate of 35 cents to 40 cents per annum on the stock. The company is stated to have in the treasury around \$1,250,000 in cash.

Statements that have been made to the effect that the New England Electric Vehicle & Transportation Company will be absorbed by the Electric Vehicle & Transit Company, which will operate a line of automobiles in Fifth avenue, New York, are eironeous. The New York company has no interest in the New England concern.

The Grand Electric Company of Bergen County, N. J., which supplies electric light and power to Hackensack and neighboring towns, reports for the nine months of its existence to February 28: Gross earnings, \$134,399; expenses, \$17,892; net and other income, \$65,262; interest charges, \$46,240; surplus for stock, \$19,022, equal to over 8½ per cent.

The Whitney-Widener-Elkins syndicate has bought up the American Air Power Company, in which Richard Croker is a large stockholder, and has obtained control of the Compressed Air Company of Hinnois, in which Joseph Leiter is heavily interested. This means that the Metropolitan Street Railway Company of New York will control nearly all the important compressed air patents in the country.

Messrs. Widener and Elkins, of Philadelphia, are attending to the details of the plan to merge all of the street railway systems of Pittsburg into the new Union Traction Company. It is claimed by a stockholder of the United Traction that they have devised a scheme to throw down the legal barriers raised by Messrs. Whitney and Stephenson, bankers, of Pittsburg, and that by June 1 the new Union Traction Company will be in full operation.

The Boston "News Bureau" is authority for the statement that the New Eug-

The Boston "News Bureau" is authority for the statement that the New England Street Railway Company has sold a controlling interest in the Winchester Avenue Street Railway Company of New Haven, Conn., to I. A. Kelsey, representing the Bridgeport Traction syndicate. It is claimed that Mr. Kelsey purchases a controlling interest at \$48 per share, and minority stockholders may secure an injunction to prevent the transfer, claiming the stock was worth more than this price.

A director of the United Traction Company of Philadelphia is reported as saying: "I do not believe that a divided don Traction stock will be paid before the latter part of this year. Earnings are steadily increasing, but during the coming year considerable new work will have to be done and the rolling stock increased." One in a position to know what the Union Traction Company is doing rays that the surplus of the company for the year ending June 30 should be below \$1,000,000.

The directors of the Metropolitan Street Railway Company of New York have formally approved the proposition to lease the Third Avenue road. The Metropolitat Company agrees to pay to the stockholders of the Third Avenue Railroad Company during the next four years in the form of dividends whatever earnings there are after the fixed charges, taxes and operating expenses have been deducted. The two succeeding years it will pay 5 per cent. on the capital stock of the Third Avenue, the following four years 6 per cent. and after ten years 7 per cent.

Avenue, the following four years 6 per cent. and after ten years 7 per cent.

The Capital Traction Company of Washington recently placed on record a deed of trust to the National Safe Daposit, Savings and Trust Company to secure the payment of 3,000 bonds of \$5,00 each, payable April 1, 1920, with interest at 4 per cent. per annum, payable semi-annually, with the right to redeem on and after April 1, 19.3. The purpose of the issue issaid to be to retire a former issue of 5 per cent. bonds, amounting to \$1,000,00, to liquidate existing flusting indebtedness amounting to about \$80,000 and to provide a fund from which the cost of reconstruction of the U street extension, the construction of the loops and the purchase of new cars may be paid.

of new cars may be paid.

At a meeting of the directors of the Chicago Union Traction Company Saturday afternoon the officers of the company were empowered to sign the agreement with the Chicago Consolidated Traction Company for the consolidation of their roads. This is the culmination of a series of negotiations between the Yerkes system of sulturban surface lines and the Chicago Union Traction Company, by which the latter secures control of 207 miles of electric railway on the north and west sides of Chicago. W. L. Eikins of Philadelphia resigned as a member of the Union Traction directors and the vacancy was filled by the election of General Manager J. M. Reach of Chicago. The proposition submitted to a vote of the Consolidated Traction shareholders was one under which the stock holders were asked in December to deposit their stock with the Illinois Trust and Savings Bank in accordance with the agreement by which the stock was to be transferred to the Chicago Union Traction Company in exchange for 4½ per cent. bonds, on the basis of a valuation of \$15 a share for Consolidated Traction stock. It is understood that the bonds will be in the nature of a collateral trust issue, the interest on which will be guaranteed by the Union Traction Company. The time for the deposit of stock expired on December 31, and it is said that about \$13,000,000 of the \$15,000,000 was turned in by shareholders.

Vol. XVIII.

## EDITORIAL NOTES.

The
Electric Automobile
Successful in a
Severe Test.

Ever since the automobile was first brought out a discussion has been going on as to what form of motive power was

best adapted to the propulsion of this type of vehicle. In France the mineral spirit motor driven carriage is the most popular, presumably owing to the fact that this form of power was the first to give the desired results, namely, lightness, combined with what would be termed in a horse endurance. In this country the steam propelled automobile has during the past year become quite popular for the same reasons. Electricity as an automobile motive power has been looked upon rather unfavorably, owing to the fact that it has taken longest to develop and apply to this particular service, the storage battery problem having proven the chief stumbling block. As a result automobile enthusiasts have looked upon the electrically propelled automobile as having but a limited field of usefulness, and consider that it should be confined to towns or large cities, where a day's run would not exceed say twenty miles and where there exists facilities for recharging the batteries.

In view of the above sentiments the result of an automobile contest, which took place recently on Long Island, will probably come as a surprise to some of the advocates of gasoline and steam. This race, which was referred to briefly in last weeks' issue of ELECTRICITY, was over a fifty mile course, the prize being a handsome silver trophy presented by a member of the Automobile Club of France. In all there were nine entries, one electrically propelled machine, five gasoline machines and three vehicles driven by steam. The electric automobile, which was driven by one of our leading automobile manufacturers, easily outspeeded gasoline and steam and covered the half century in 2 hours, 3 minutes and 30 seconds, or some fourteen minutes faster than any of the other vehicles.

It is the general belief that an electric automobile must necessarily be heavy and unwieldy, but strange as it may seem the winning of this contest is in part attributed to the fact that the electric vehicle being of light construction was better able to make its way against the strong head wind that was blowing than any of its competitors.

Although this contest does not necessarily prove the superiority of electrically driven vehicles over those propelled by other motive powers, it does go to show that it is by no means impossible to construct an electric vehicle capable of traveling a distance of fifty miles at a high rate of speed without it being necessary to sacrifice the essential quality, lightness. It also gives weight to the prediction recently made by Mr. A. L. Riker before the New York Electrical Society that "inside of six months a light, electric vehicle will be produced, not exceeding 1,000 pounds in weight, that will be capable of carrying two passengers fifty miles on one charge."

\* \* ;

The Pacific Cable.

The near future should see much activity the world over in the submarine cable laying line. Germany, France

and Russia are all discussing the advisability of laying cables to various points, while only recently the U. S. Senate at Washington passed the Hale bill authorizing the laying of a cable to connect San Francisco with Honolulu, Hawaiian Islands.

As stated in the issue of ELECTRICITY of January 3, 1900, a number of bills have been before Congress looking to the construction of a submarine cable, to connect this country with its new possessions in the Far East, and incidentally to establish communication with Japan and China. The bill that has just been passed by the Senate might be termed the Navy bill. It provides for a cable only to Honolulu, but declares a purpose to extend it in the future. The first section reads as follows:

"That to the end of establishing hereafter telegraph communication between the United States and the Philippine Islands and Japan, under the waters of the Pacific Ocean, there shall be constructed, under the supervision of the Secretary of the Navy, a submarine telegraphic cable or cables and connecting land lines from the city of San Francisco, Cal., to the city of Honolulu, H. I., over such route as may be deemed by the Secretary of the Navy to be the most practicable."

The bill carries with it an appropriation of \$3,000,000, and the Committee on Naval Affairs, which reported favorably on the bill the latter part of March, believes that the line can be built for this amount. Plaps are to be prepared by the Secretary of the Navy, and naval vessels will be made use of as much as pos-

sible in making surveys, and carrying on the work. A provision in the bill requires that "the cables, wires and other instruments, materials and appurtenances necessary in the work of laying the cable shall be of American manufacture, provided that they can be procured at a cost not exceeding 12 per cent. above what it could be procured for in foreign markets."

When completed the operation and control of this cable is to be transferred to the Postmaster General, who will have authority to receive and transmit messages in the interest of commerce and the public.

The clause in the bill requiring that the cables and other apparatus be of American manufacture is an exceedingly good one, even though it may cost the Government slightly more than were the materials purchased abroad, as well as occasion some delay in the carrying out of the work. At present, as is well known, this country is but poorly prepared to supply large quantities of submarine cable, but the erection of plants for the manufacture of this line of material are contemplated, and if given sufficient encouragement by the Government, there is no reason why the United States should not in time rival England in this line of industry.

That a cable to Honolulu will prove of commercial value to this country there is little doubt, but it is to be hoped that before this first link in the chain to the Far East is completed arrangements will have been made for extending it on to the Philippine Islands.

\* \* \*

The
United States
Leads the World
in Copper
Production.

The Bureau of Statistics of the Treasury Department has received a copy of a German publication covering the use of copper during the century just

drawing to a close, and the wonderful part the United States has taken in its consumption. During the past decade the United States has produced more than one-half of the total copper production of the entire world, and this is a remarkable evidence of our industrial growth, when it is noted that in the decade preceding this we only supplied about one-third of the total output, and in the decade of 1871–80 only about one-sixth of that amount.

The growth of the copper production during the century has been very rapid, the first ten years showing only 91,000 tons; the fifth, 291,000 tons, and in the decade just ending, 3,643,000 tons, of which 1,963,000 tons are supplied by North America, and it is claimed that the larger portion of that amount is the output of mines in the United States.

The greatly increased demand for this material is further illustrated by the fact that although the production has increased from 505,909 tons in the decade 1851-60 to 3.643,000 in the decade 1891-90, the average price, according to the publication from which this report is made up, has only fallen from \$539.50 to \$252,75 per ton; the production having increased by six-fold, while the price has decreased only about one-half.

While the production from all parts of the world has increased with startling rapidity during the century, that of North America has by far outgrown all other parts of the world, and it is apparently through the enormous supplies of North America—chiefly those of

the United States—that the world's production has so greatly increased.

A table contained in the publication named gives the production of each decade by principal countries, and shows no record of production in the United States earlier than the decade 1841-50, in which period the total production is placed at 2,400 tons, while in 1851-60 it was 37,000 tons; in 1861-70, 97,000 tons; 1871-80, 186,000 tons; in 1881-90, 730,000 tons, and in 1890 1900, 1,963,000 tons; the copper production of North America in the decade 1891-90 being thus two and one-half times as great as in the preceding decade and ten times as large as in the decade 1871-80.

In the matter of consumption the figures are equally interesting. A table is given showing the consumption of England, France, Germany and North America, in which it appears that the consumption of the four countries named in 1899 was 409,583 tons, against 268,447 tons in 1893, being an increase of about 50 per cent. during the period under consideration; while in North America alone the production is given at 77,433 tons in 1893 and 162,000 tons in 1899, the growth being over 100 per cent. during the period named.

The rapid increase in the share of the world's copper consumption made by the United States is illustrated by the export figures for the decade just ended, which show that the exportation of copper in ingots, bars and plates, which in 1890 amounted to 20,237,409 pounds, had increased in 1899 to 254,987,164 pounds, while the total value of the copper exported, exclusive of ore, increased from \$2,349,392 in 1890 to \$35,983,529 in 1899.

### UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

The eighth annual report of the General Electric Company has just made its appearance. It shows that the sales during the last fiscal year, ended January 31, amounted to \$22,379,463, which, added to royalties, dividends and interest, brings the total amount taken in to \$24,406,068. The cost of goods was \$16,436,935, and general expenses \$2,490,002, leaving a net profit of \$5,479,131. A still further reduction of \$2,000,000 has been made in the valuation of patents, franchises, etc., leaving the patent rights, etc., standing at \$2,000,000. The report in full will appear in the next issue of Electricity.

PRESIDENT C. J. GLIDDEN, of the Erie Telephone system, is reported to have made the statement that inside of five years the telephone, telegraph and cable business of the country would be consolidated under one management, employing a capital of \$250,000,000.

As the French public complained of the poor telephone service the Minister of Posts and Telegraphs has begun the experiment of replacing the girls by men at one of the principal "centrals" of Paris. His newspaper statement announcing the change confesses that all beseeching and disciplinary measures have been powerless to prevent the girls from chattering among themselves instead of devoting their sole attention to connecting subscribers. Men are expected to be more reasonable.

WORK is rapidly progressing on the aerial railway between Barmen and Elberfeld in Germany. This railway, which was described in

the issue of Electricity of November 30, 1898, will be about eight miles in length, and follows the course of the river Wupper—not Kupper as several papers have it. This road is unique, the cars being suspended at a considerable height by means of a structure somewhat resembling that of the elevated roads in New York City. The cars, which have a seating capacity of fifty, are provided with two 36 hp. motors, which will permit of an average speed of about twenty miles an hour. The work on the system is more than half completed, and it is thought that the road will be ready for operation about March 1, 1901.

Among the bills signed by Governor Roosevelt since the New York Legislature adjourned was that of Mr. Beddell, permitting any surface railroad to abandon any portion of its route which it may deem no longer necessary for the successful operation of its road and the convenience of the public.

An electric railway, to be 409 miles long and to cost \$14,000,000, is to be constructed, with the approbation of the Government to the extent of \$6,000,000, connecting the States of Tobasco, Yucatan, Chiapas and Campeche, Mexico.

WORK has been commenced on the construction of the new power transmission line to run along the mountain from the Cataract Power Company's station at the De Cew Falls to the city of Hamilton, Ont. The work will be finished, it is expected, and the line ready for operation on July 1.

THE Automobile Club of England started on its 1,000 mile run on Monday last. The course is from London to Edinburgh and back. Seventy-five vehicles started. The run was planned to demonstrate the capability and intelligence that has been reached in the management of this type of conveyance.

THE Paris Exposition is now brilliantly illuminated at night. There are 3,115 incandescent lamps at the great gate entrance, in addition to 12 large arc lights. On the cupola and minarets there are eight searchlights and 16 simple reflector lights upon the pylons.

THE General Electric Company has placed E. F. Kirkpatrick, a Pittsburg man, in charge of the Chicago office of the Siemens & Halske Works.

The members of the Fourth District of Dental Surgery held their thirty-second convention recently at the Hotel Edison, Schenectady, N. Y. A feature of special interest was an address by Mr. Martin P. Rice of the General Electric Company on "The X-Ray and its Uses in General and Dental Surgery" (also showing apparatus in use). The lecture was delivered in a darkened room and illustrated with apparatus furnished by the General Electric Company.

ONE of the most important of the many developments of electricity now going on in Canada is that for the production of calcium carbide on the Saguenay River, near Chicoutimi, Que. On February 5th last Mr. T. L. Wilson of St. Catherines, Ont., the inventor of the process of producing calcium carbide, bought from the Quebec Government the Saguenay

power at tidewater, which is capable of a development of 69 feet head and will give over 200,000 horse-power. At this point the Ship-Shaw River falls into the Saguenay, and has quite a flow of water, giving at its minimum about 15,000 horse-power under a development of 138 feet over the water wheels, the total fall being over 150 feet. Here Mr. Wilson proposes first to develop 10,000 electrical horse-power on the Ship-Shaw, and a second development of 100,000 horse-power on the Saguenay, leaving a further possible power development on the Saguenay of another 100,000 horse-power. The development of 10,000 horse-power on the Ship-Shaw River is now proceeding. There will therefore be an immense quantity of electric power available for renting to other industries, and being on tidewater the location would afford a most advantageous situation for manufacturing industries, particularly that of woodpulp and paper mills, it being the center of the finest pulp wood district in the world.

ACCORDING to Prcf. Borchers, the eminent electro-metallurgist, the world-manufacture of calcium carbide is utilizing a power equal to 180,000 hp.; that of the alkalies and the combinations of chlorine, 56,000 hp.; of aluminum, 27,000 hp.; of copper, 11,000 hp.; of carborundum, 2,600 hp.; of gold, 455 hp.

THE City of Mexico is ordering about all the machinery and equipment material for an extensive system of electric street railroads in the United States.

In a few days the officials of the Delaware and Raritan Canal will make a test of a new electrical canal boat propelling device. The machine works somewhat similar to a trolley, and is expected to pull much heavier loads and at much higher speed than can be done by the present method. Superintendent Henry W. Dunn, of Trenton, it is said, will conduct the test

An automobile exhibition will be held in Vienna, Austria, under the auspices of the Austrian Automobile Club from May 31 to June 10. The exhibits will include automobiles of every description, as well as kindred appliances. Foreign goods to be exhibited will be admitted free of duty, and returned free of charge after the closing of the show.

TWENTY electric illuminated signs for Wichita, Kan., have been ordered from the Hunter Electric Sign Company of Cincinnati. These signs will be used on the open cars which will run during the summer months. The signs consist of a box which contains a lamp and a roll on which are printed, in transparent letters, the names of the different lines. The signs are provided with a handle which extends through the roof of the vestibule so the motorman can place any of the names to the front.

MANY prominent railroad men have been watching the competitive tests of elevated railroad electrical equipments over the new third-rail system in the Boston Subway. The tests are designed to prove the best and most improved system, and the one which shows superior qualifications is to be accepted for the new Boston elevated road, fast nearing completion. They comprised the running of trains at high speed equipped by three different electrical methods.

THE Commercial Cable Company has given notice that the International Telegraph Bureau announced that the Eastern Extension, Australasian and China Telegraphs have signed an arrangement with Southern Australia, Western Australia and Tasmania for reduced rates to these three colonies, to go into effect on May 1.

The Staten Island Rapid Transit Railroad Company has purchased from the Pennsylvania Railroad the engine which broke the record between Washington and Elberon, N. J., at the time it pulled the train carrying President James A. Garfield after he was assasinated in the Baltimore & Ohio depot at Washington. The engine is now known as No. 20, and will do service on the Amboy division.

News from West Chester, Pa., states that an electric clock, which will ring the bells according to the Normal School programme, is shortly to be placed in the office of that institution, to take the place of one which has been in use about nine years. The new clock will be more than four feet in height, and will be a model of usefulness. Inside it will be a pilot clock, by means of which other timepieces, in various parts of the school plant, may be run when connected by electric wires.

MR. E. PIERARD, a telegraph engineer of Belgium, has had an opportunity of studying this last winter the effect of snow on the telephone wires near Malines. He found, says the London "Electrical Engineer," that a bronze wire 2 mm. in diameter collected an ovoid of snow, whose two axes were respectively 28 mm, and 36 mm. The weight of the snow was, roughly, 1.78 times that of the wire. A smaller wire 1.4 mm, in diameter collected an envelope of snow 4.38 times its own weight. The result of this snow collecting on the wires running from the central office in Brussels imposed an extra weight of over 30 tons on the supports. In calculating the deflections produced by the heavy coats of snow, the author found that in many cases the long spans were safer than short ones. This was because the long spans sagged sufficiently to enable the central portions to find additional supports on house ridges, etc. As an example of what these sags would be with the weights mentioned above, the author found that with a span of 100 yards there was a sag of four yards, with a span of 550 yards the sag was about 25 yards.

At the Zoological Garden in Cincinnati, O., an ostrich has been suffering from paralysis. He has been placed in a derrick-like sling improvised by Superintendent Stephens with hopes of saving the bird. While he is suspended in air, hung up by the neck, electric shocks are administered. Three shocks have been given, and it is now believed he will recover.

Some interesting experiments upon the corrosion of metals in sea water have been made during the last two years at Kiel. The method followed was to cut in two twelve samples of the metals to be tested, nine of which were then submerged in the sea water while the other three were held to serve for purposes of comparison. At the end of eight months three of the specimens immersed were taken out of the water and compared with those that had been retained outside. At the end of sixteen months three more were taken out, and at the end of twenty-four months the three last. These samples were composed of alloys of copper rich

in zinc, of bronzes with a small proportion of zinc, of bronze free from zinc, of pure aluminum bronze and of aluminum bronze containing some zinc or zinc and iron. The last showed an especial resistance to corrosion, not having been attacked at all in the two years of immersion. The alloys containing zinc gave the least satisfactory results. The alloys of copper and tin and of copper and aluminum, and the bronzes containing iron resisted corrosion perfectly, although they were in contact with iron in the water. The bronzes containing iron placed in the sea water in contact with the bronzes containing tin showed a more or less notable attack. An important point for the prevention of corrosion is to avoid placing these alloys in contact with metals that are electropositive in relation to them.

243

A PHYSICIAN of Toronto, Can., has designed a self-propelled automobile wheel chair for invalids. It carries a four-horse-power motor and sufficient battery capacity for a 15-mile run at a rate of four and a half miles an hour.

The Paterson Parchment Paper Works has recently completed the erection of a large electrical filtering plant at its works in Passaic. N. J. A large amount of water is used in the making of paper. This water is pumped from the Passaic River. It is first sent through large tanks over coils charged with electricity. The water, be it ever so black, after a trip through the tanks, is clear as crystal. The new machinery installed removes the stench from the water, which the old system failed to do

MR. WU TING FANG, the Chinese Minister, who will go to St. Petersburg in the early summer as the diplomatic representative of his country, will leave the United States in a blaze of glory. His departure will be delayed until after the automobile meet to be held at. Washington, D. C. He is a devotee of the horseless carriage and is making great preparations for the coming meeting. He is having built in this city a gorgeous automobile. It will be of the phaeton type. The body will be painted a brilliant oriental yellow and the velvet upholstering will be of the same hue. It will seat four persons. Mr. Wu is surprised that a yellow vehicle could arouse so much interest. "Yellow," he says, "is a very quiet color in oriental countries, and with white is considered as a half mourning combination."

#### Proposals Invited.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until May 1 for furnishing the League Island, Pa., navy yard with a quantity of electric fans and blowers. Specifications and blank proposals will be furnished intending bidders upon application to the navy pay office at Philadelphia, Pa., or to the Bureau at Washington, D. C.

Sealed proposals are being invited until May 3 for furnishing the District of Columbia with telephone supplies during the coming fiscal year. Specifications and other information will be furnished upon application to the Board of Commissioners, Washington, D. C.

The Interior Department is inviting sealed proposals until May 3 for furnishing the Government Hospital for the Insane at Washington, D. C., with 3,000 incandescent electric lights, of 16 cp., 110 volts. Blank forms of proposals will be furnished upon application.

#### ELECTRIC MINING MACHINERY.

#### BY FRANK C. PERKINS.

During the past few years there has been great advancement in the utilization of electricity in mining operations. The plants installed for the use of electricity in mines at the present time represent a vast investment of capital and include in many cases water wheels and turbines, but most frequently boilers, engines,

in propelling the machine to points desired. When the truck is in use all the moving parts except the main spur gear are disconnected.

In equipping a mine with coal cutting machinery it is not necessary to make any special preparations inside the mine other than the stringing of the wire. The machine mounted on its truck is brought into the room where the cutting is to be done and delivered to the face of the coal, the truck running on the

FIG. 1.—SELF-PROPELLING MACHINE WORKING IN 34" OF COAL.

dynamos, wiring, switchboard apparatus, electric undercutting machines, electric drills, electric mining locomotives, electric pumps, fans, and other machinery utilized in this line of work. While the reader has frequently had opportunities to study the general construction of the machines now on the market, it may be of interest to see from the accompanying illustrations the methods of operation and means employed in fastening the machines in place in mines where the space at hand is limited. Every effort is made to make the machines as compact as possible, as will be noted in illustrations, Figs. 1 and 2. An electric chain coal mining machine on a self-propelling truck is seen in the first illustration as it is being moved about inside a mine, while Fig. 2 shows a machine in position to begin cutting.

The electric coal cutting machines are made up of the following distinct parts-the outside frame, the inside or cutting frame, the carriage and the electric motor which supplies the power. Ironclad multipolar motors are generally used, the field being of cast steel. The carriage is made of cast steel with motor supports made solid with the body. The carriage also contains the main driving shaft bearing. The outside or bed frame consists of two steel channel bars and two steel angle bars securely fastened together by means of heavy steel braces. A heavy steel casting joins the channel bars and forms a guide for the inside frame. The inside or cutting frame consists of a forged steel center rail, a cutter head and two steel guides in which the cutter chain runs.

A self-propelling truck is frequently used in connection with coal cutting machines to facilitate the movement of the cumbersome mechanism from point to point about the mine. The chain machine is so mounted on the truck that its moving parts may be disconnected and the power from the electric motor can be used

wooden rails used for mine cars. The rear end of the truck is lifted, the machine easily slides off, reaching at once its proper position to begin cutting (Fig. 2). Connection is made to the feeders, the current is turned on and the maDistrict of West Virginia. The cable is connected to the motor and reel terminals, and by means of the starting switch lever the machine is put in operation. A cut is made 6 feet deep by 44 inches wide in about 3½ minutes and one minute is required to withdraw the machine. The jacks are then loosened and the machine is moved over for another cut. The operation is then repeated until the entire width of the room is undercut 6 feet deep.

Two men are required to operate a machine, a machine runner and a helper. These two men may be seen in Figs. 1 and 2. The duty of the runner is to see that the machine is kept in good condition, set rear jack and start machine, while the duty of the helper is to see that the front jack is properly set, attend to bits and shovel back the cuttings. When the machine is started it continues to advance until the full depth of cut is made, when it is automatically thrown out of feed and is ready to reverse and withdraw from cut.

Another type of cutter which is used to operate in a minimum space is what is generally known as the single rail machine The cutters which disintegrate the coal are inserted in a large wheel. The undercut can be made 3, 4, or 5 feet. One such type is the Longwall machine. The height is only 18 inches and the width without wheel 3 feet 9 inches, while the length over all is 8 feet 2 inches. The feed on these machines is 25, 16 or 8 inches per minute as desired, and can be varied while the machine is in operation. In order to follow the variations in the floor of the mine, the wheel swings on a bearing in such a way that it is adjustable in a horizontal plane. The electric motor on this machine is also a multipolar type and may be operated in a mine using circuits of either 220 volts or 500 volts potential.

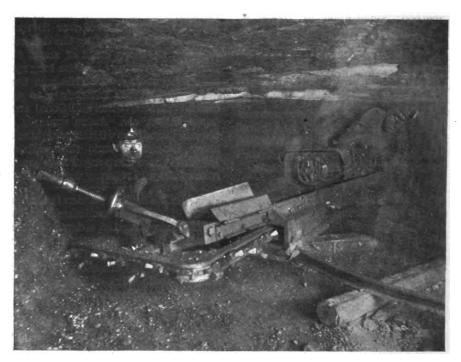

Fig. 2.—Electric Chain Coal Cutting Machine Ready to Begin Cutting.

chine is ready to cut. In a room 24 feet wide, which is the average, the machine would be placed in position at the left hand rib, the front jack being securely screwed to the face of the coal and the rear jack to the roof. Fig. 3 illustrates a 500 volt electric chain machine in position to cut. This was taken in a very thick vein of coal, as will be seen. This picture was taken in a mine in the Pocahontas

The next and last type of machine is known as the electric shearing machine. This machine is used to make a vertical cut in the coal. It is built to undercut six or seven feet deep and can be used in any thickness of vein, making the cut from top to the bottom. This machine is mounted on a truck and has an electric motor similar in construction to those above mentioned.

When shearing a room or entry with machines it is necessary to raise the machine to the top of the vein. The best results are obtained by making the first cut at the top and then letting the machine down far enough to make another cut. To provide for the secure and rigid support of the machine two columns are used at a point representing the balancing position, to which the frame is clamped tightly to hold it in place when cutting. The front end of the machine is steadled by two auxiliary columns, the four columns varying in length according to the thickness of the vein in which the machine is working. In general it is possible with such a machine to cut from

illuminating body e (Fig. 3) is connected in a manner which will be described later on, to two metal wires fastened to the pointed metal pieces g g. These are forced into the slotted metal tubes d d (Fig. 2), and the complete holder is then screwed or otherwise fastened on to the globe, which also contains openings for the introduction of the light which heats the pencil. This lamp very readily admits of the interchanging of the pencils and cleaning the globe. Fig. 4 illustrates a similar lamp for obliquely-placed lamp-holders, u being a small spring attached to the contact piece c and ensuring constant connection with the center of it. Slight modifications of the above

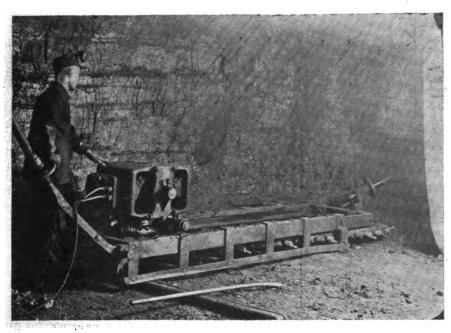

Fig. 3.—500 Volt Electric Chain Machine Working in a Very Thick Vein of Coal.

50 to 100 feet of entry per day of ten hours. A single cut is 36 inches high, five feet, six feet or seven feet in depth and about four inches wide.

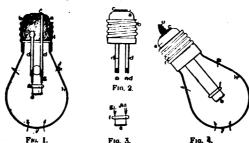

Electric power drills have not been extensively used in mines, but are now being more generally introduced.

## RECENT DEVELOPMENTS IN NERNST LAMPS.\*

Although the fundamental mechanism of the Nernst lamp has now been patented for some years, and largely capitalized companies have been formed for the purpose of exploiting these patents both in this country and abroad, yet the only instance of its commercial employment so far has been in Göttingen, and that quite recently. Engineers, however, have not been idle, and in the meantime we gather that much time and energy, and also money, have been expended in developing and improving this lamp. Judging from the Patent Office files, these attempts have not been directed at merely evading Nernst's fundamental patent, but rather at devising improvements in the lamp itself which would render it more convenient to use.

The first patent to which we desire to draw attention (No. 6,024, 1899) was taken out on behalf of the Allgemeine Electricitäts-Gesellschaft, and describes a form of lamp which can be fitted to an ordinary Edison or Swan lampholder. The special features of this type of lamp are clearly indicated in Figs. 1, 2, 3. The

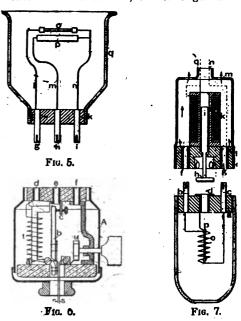

holder are described for adaptation to a Swan lamp. The simple form of the type of lamp just described has the advantage of cheapness, but on the other hand, the necessity for holding a light to it for some little time renders its employment somewhat inconvenient, and must react against its exclusive or even extensive use. This difficulty has been ingeniously met and, we suppose, overcome in the lamps described in patents Nos. 6,025, 6,026 (1899), also taken out by the Allgemeine Company. The

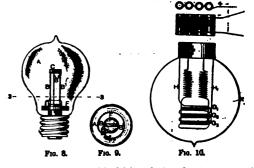

principle made use of is in every case to pass the current simultaneously through an auxiliary heating coil in close proximity to the illuminating pencil and the parallel circuit containing the pencil itself. At first, when the pencil is cold and its resistance is extremely high, nearly all the current will pass through the auxiliary coil. This becomes heated, and in turn raises the temperature of the pencil, which rapidly increases in conducting power, taking an increasing portion of the current. The auxiliary circuit is completed through a steel contact key situated near to the iron core of an electromagnet placed in series with the illuminating circuit; and when finally the cur-

rent passing through this circuit is sufficiently strong, the core will attract the steel hammer of the contact key and break the auxiliary circuit.

Figs. 5 and 6 illustrate the lamp and holder respectively of a lamp of this kind. The two circuits are here plainly discernible. The first passes from r through the iron piece b, making contact with the screw c, and through e and k

to the auxiliary heater p, and back through the parts marked n, i, f, u to the other leading wire s. The second circuit starts also from r and passes round the coil t of the electromagnet, and thence through t to the illuminating pencil s, and back as before. When the temperature of the pencil has been raised sufficiently to make it a good conductor, the current passing through the electromagnet will cause the core to attract the iron piece s and break the auxiliary circuit. Fig. 7 illustrates another lamp of the same kind. In this case the auxiliary heating circuit may be traced from s

through the metal bobbin of the electromagnet, which at its lower extremity rests on the contact tube d, and from this through the heating coil o and back along the dotted line to n. The pencil p, in this case inside the heating coil, is electrically connected to the coil of the electromagnet k, to which g is also connected. When this circuit takes a sufficient amount of current, the iron core i will be drawn up into the coil, and the auxiliary circuit will thus be broken. A slight modification of the construction of this lamp readily adapts it for the case of bayonet contacts instead of the sliding contacts illustrated in the figure.

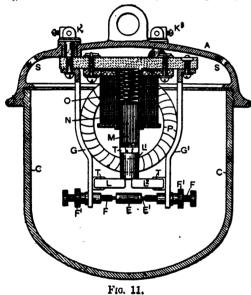

The same object is attained in a slightly different manner in the case of a lamp patented by the British Thomson-Houston Company (patent No. 5,941, 1899) and illustrated in Figs. 8 and 9. In this case the pencil is surrounded by a heating coil, c, of high resistance, and an

<sup>•</sup> From the "Electrician," London.

arrangement is provided whereby the current in this circuit is automatically broken when the pencil d takes a sufficient amount of current. Porcelain, clay or magnesia are some of the substances mentioned in the specification for the illuminating pencils. It is particularly claimed for this type of lamp that it is specially suited for high-voltage circuits and also for alternating currents of low frequency. Fig. 9 is a section taken through 3, 3, (Fig. 8). An entirely different kind of lamp has been designed by Prof. Fessenden. In this the mechanism permits of coating the pencil with a thin layer of carbon or graphite sufficient to conduct the current in the first instance, and finally to be burned away when the pencil is working properly. This coating of graphite must be re-applied on every occasion on which the lamp is to be lighted.

The lamp shown in Fig. 10 is specially designed to hold a reserve of several pencils, each of which comes automatically into use when the lower one has burned out. The method of arranging these pencils is shown in the side view.

A lamp of somewhat different type was patented by the British Thomson-Houston Company (No. 13,404, 1899) and is represented in Fig. 11. Here the auxiliary heating is per-

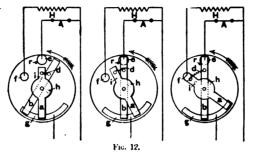

formed by striking an arc in close proximity to the pencil, the flame of which heats it. When this conducts sufficiently well, a solenoid in series with it draws the carbon pencil up and the auxiliary circuit is thus broken.

Mr. Hirst, of the General Electric Company, has patented (No. 24,264, 1898) also a switching device for use with Nernst lamps of the independent heating circuit type. This is illustrated in Fig. 12, which is self-explanatory. The first figure represents both circuits open; the second the heating circuits closed. In use the heating circuit switch is held for an instant, during which time the filament will have become sufficiently heated to conduct, and is then allowed to fly back by means of the spring arrangement shown.

The great difficulty in connection with all types of Nernst lamps, and which must in the first instance be satisfactorily overcome, is that the materials of which the pencils are made conduct like electrolytes, in so far as their resistance diminishes with increasing temperature. There exists therefore considerable danger that the illuminating pencil will be burned out. Much ingenuity has been expended in discovering a material which would properly compensate for this effect by a corre-

sponding increase in its resistance under the same circumstances. In the Allgemeine patent specification (No. 6,027, 1899) no materials are specifically referred to as being employed, but it is intended to apply broadly to all materials having a high temperature coefficient. This compensating-resistance is to be placed near to the pencil, and to be subjected to a slight preliminary heating in order to bring it more nearly in correspondence to its resistance when the final current passes through it.

Another important difficulty lies in the method of connecting the non-conducting pencil to the metal wires connecting it to the

external circuit. Patents have been taken out by the Allgemeine Company for the following soldering mixtures, which are said to be suited for this purpose:

	Thorium, %.	Zirconium, %.	Yttrium, %.	Cerium,%
1 2 3 4 5 6	93.7 80.0 95.0 70.0 70.0 80.0	3  10 	3 20 5 20 30 19.5	0.3    0.5

In addition to these, Messrs. Siemens & Halske have patented a method (18,489, 1899), in which by the repeated heating of the pencil to incandescence, and dipping into certain powders or pastes of the following metalloids-boron, silicon and their oxygen-free compounds—the end becomes soft and admits of the conducting wire being pushed into it. The metals, manganese, molybdenum, chromium, titanium, nickel, the platinum group of metals, and the oxygen-free compounds of these metals, such as the sulphides, phosphides, nitrides and carbides, are referred to as being suited for the same purpose.

#### USE AND CARE OF ELECTRIC METERS.\*

#### BY E. D. KELLY.

Ten or twelve years ago electric energy was invariably supplied at a fixed rate per month for each installation, without much regard for the amount actually furnished, and while no one could claim that the system was advantageous, either to the plant furnishing the current or the customer, still while there was no accurate recording meter suitable for general installation, its continuance was a necessary evil, as proof of its being an evil, 90 per cent. of the plants lost money. In small cities where electric lighting was introduced it was looked upon as an enterprise that must be supported. Some patronized it for the novelty, and others as an object of charity. In all cases they would turn on all lights, and burn them as long as current was furnished. If you had 3,000 lights wired in, you should have 4,000 light capacity; but thanks be to the recording

meter; without it many of us would have been bald-headed, busted or in some other line of business.

Put your plant on strictly a meter basis, and you are perfectly safe with 30 per cent. overload wired in—in fact, I know of one plant where there are 2,000 lights, 35 arcs, 94 fans, 107 hp. in other motors, besides some heating and cooking appliances, and two 35 kw. generators to take care of all. True this plant has a duplicate set throughout, yet there has never been a time when it was necessary to use both sets at one time. This plant is now on a paying basis,

There was a time not many years ago when the income was almost if not quite as large as now, yet the output in current, as well as expenses was considerably larger, as the stock holders will testify. They had to go down in their pockets and pay the plant out of debt—this is only one of a thousand instances where recording meters have been the salvation of electric industries.

At the present, with so many recording meters on the market, and many of them can be relied upon in their respective places, the selection of a meter is not a difficult task. However, if you are not familiar with a meter suitable for your business, get the counsel of an engineer of experience in this particular line.

There is no place on earth where an electric current is sold that should not be measured and paid for according to amount used, whether it be for light, heat or power, each class to take its respective rate according to amount of current consumed. More consideration should be given in rate-making to number of hours used per day.

Flat rates make your crank pins flat; give your commutators flat sides; your coal pile gets flat, and your foreman gets flat on his back prostrated from overwork, while the waterworks company, from whom you get your water supply gets fat. This combination of circumstances most invariably produces a flat bank account. We have just as much right to go to a grocery or market and demand a flat rate for our month's supplies. You say to a grocer: "There are so many of us in family. Give us a flat rate for our month's groceries." It makes no difference how much you eat or how much you weigh, or how many of your friends you entertain. The grocers are on flat rate; your neighbor, who does not eat so much, does not waste so much, nor entertain so often, yet has a larger family, must help to pay for what you waste. However, I turn again to rates; I go to a residence to solicit business; I make my usual song-one lamp, \$1, two lamps, \$1.75, three lamps, \$2.25, and so on down to ten lamps at 50 cents each. The prospective customer will say: "We burn a certain number of lamps so many hours each night, and oil costs us just so much." I look around and see three of these lamps in one room. They are small hand lamps-no one burner capable of giving 4 candle power. I install a meter and one 16 cp. will light this room nicely, and you have made a permanent customer, one who cannot abuse you if your meter is properly cared for. Then I meet with swinging oil lamps, Rochester burner pattern (I have quit the flat rate to talk meter strictly). He says, "My oil costs me so much, what is your electricity worth?" A standard lamp 16 cp., will cost you one cent per hour. The next question always is: "How will this compare in light?" you must be honest enough

<sup>\*</sup> A paper read at the annual meeting of the Southwestern Gas, Electric and Street Railway Association, Waco, Texas, April 18, 1900.

to tell him that one lamp will not equal it, but it will take two or three, as the case may be, then you will have his confidence, and if your meter should stop, and you told him so, he would believe you. I tell him, "If you burn three lights a certain number of hours every night, your bill will be exactly so much for the month." After I install the meter and lights I turn the current on, lift the cover off the meter, and explain the working of it to my customer, take pains and explain it carefully. I find it easily explained in this way for the first lesson. When the first hand has made a revolution, it will cost you 10 cents, the second hand one revolution, \$1; the third hand, \$10, and so on. Of course, according to the dial, your rate and factor of meter. Turn one light on and show him how it runs, turn light off and show how it stops. I turn them all on, one at a time, and have the customer watch the speed increase. This gives him an idea why it will register just according to number of lights burning. After taking this pains you will usually have a satisfactory customer. However, not every time. I have had them complain that their meter was running too fast, when I would resort to the following test. After having the average efficiency of the lamps, and you can get this by the use of the direct-reading wattmeter, or the volt and ampere meter, which you can have in portable instruments, or, better still, if your current is direct, a millivoltmeter, with shunts for different size loads, after arriving at the efficiency take the reading of the meter. I ask the customer to turn on a certain number of lights, and burn them so many hours, keeping this information to himself, but be sure and keep it correctly. When the time is up, I have him send for me; I take the reading of the meter, subtract the previous reading and reduce this to lamp hours, according to efficiency of lamp used. Have my customer, too, reduce his time to lamp hours and compare; this will come so close, if done correctly, that you are not liable to have any more trouble with the doctor. For the next time he has a bill larger than he anticipated, he will conclude that Mary is keeping late hours in the parlor, where there is usually three or four lights.

APRIL 25, 1900.]

Next the lighting of stores, offices, lodges, hotels, public buildings, and last, but not least, saloons; for here we are abused on flat rates very much. I have known saloons to leave their fans running all night after closing, simply because it did not cost anything. These fans were their property, and they did not seem to think the cost of wear and tear equalled the satisfaction of getting something for nothing; another instance comes to my mind. I was passing a saloon one bright summer morning, and noticed an arc light burning inside. I approached the proprietor in a good humor, and asked if he needed this arc light to run this late in the morning. He said it might be turned off now, as the sun was high enough for the awning curtain to be raised without it shining in. It is needless to say that this was a flat-rate customer. I must say all classes of business should be on a meter basis. Meters in business houses are much easier located than in residences, especially when the former is of brick or stone. The latter is usually frame in our Southern country. The slamming of one door will shake the whole house. A jar is very detrimental to meters. The damage to light load meter accuracy, by reason of vibration, is much greater than is generally understood. Wearing of the jewel results almost entirely from reciprocating and not the rotary motion of the shaft. Since vibration is not always avoidable, care should be exercised to see that meters are so constructed as to permit the ready renewal of shaft, point and jewel, without the necessity of removing the meter from the point of installation. The bad effect of vibration is not confined to the jewel and shaft point. It tends to gradually shake loose fine wire connections and to cause sparking at the brushes, building up an uneven surface on the commutator. This often lifts the brush, and your meter stops until another jar seats the brush. Then your meter starts again. Dust and dirt will have the same evil effect. So it is very essential to locate meters in clean, firm places, and avoid extreme heat. If possible put it on a brick wall. Avoid thin partitions.

#### THE PROPER SIZE METER FOR LIGHTS.

This should be thoughtfully considered. A one hundred light meter, should not be expected to register correctly on two or three lights, nor a two hundred light meter on four or five lights. While it will cost a little more, it is much better, in all cases where a large number of lights are wired in, and it is known that quite often there will only be a few lights burning, to install two to three meters—stand part of the expense yourself, if you cannot convince your customer that it is to his interest, for it certainly is to yours.

#### SYSTEM OF READING METERS.

A plan I would recommend is different in some respects to the book form of duplicate dials generally in use. Use a sheet, a convenient size eight by twelve inches; this is sufficient for twenty meters, allowing four square inches to the meter. All that is necessary to go in this space of one inch by four is the name of customer, a duplicate set of dials, the face reading of meter, factor and the result. Date this sheet at the top, fill in name of the customer; not alphabetically, but group them in districts. Then you are ready to leave the office to read meters. Mark the location of each hand on its respective dial, put down the factor of meter, and number of meter, if more than one at this place. The balance is done at the office.

Some writers have suggested the plan of making heavy lighting short months by reading on the 28th or 29th of the month, and let it finally come out when the nights get shorter, or read the meter down and finally bring it all out when the bills are smaller. This I do not approve of. Every business man should be willing to pay for what he gets and it is easier to show him where it was used at the time than later on. When business is good he feels good and does not mind paying bills. If you carry a part of December account over in the spring, when he has nothing to do but kick, you will have trouble every time. It is much better to educate your customer to read his meter and teach why it will register only one light when there is but one light burning, and a dozen lights when twelve are burning.

## MOTOR SERVICE.

This should always be on the meters—first, because you must pay for what you furnish, second, because the customer should not pay for something he does not get. This is not liable to happen, for they will usually stand the wear and tear, furnish oil and let the mill run empty because it does not cost any more. The use of a meter will soon teach the customer to keep his shafting well lined up, bearings cleaned and oiled, belts and pulleys in

good condition, for this reduces friction, takes less power and makes the business more profitable and popular. Location of meters for this class is a knotty problem. I include in this all kinds of power except street railway service. In this case the meter should be located on the feeders in the station, installing meters for motor service; the meter should be placed on the station side of the controlling switch, not on the motor side. This should be done for two reasons. All forms of recording wattmeters have potential winding of fine wire, the mechanical strength of which is very low. Every time the controlling switch is used this winding is cooled or heated, and the resulting expansion and contraction causes the insulation of the wire to chafe and weaken and occasionally break off the wire. Again, when the main shaft switch is pulled, there is commonly a higher potential back kick which searches out any point of weak insulation, caused as a rule by the chafing just mentioned, breaking through and causing a burnout of the potential winding. Much, if not all, of this trouble can be avoided by placing the meter on the service side of the switch. In buildings where machinery is operated it is very hard to avoid vibration. Meters can frequently be cushioned; some few central stations provide racks which carry the meter upon a sponge rubber cushion. In cases of frame buildings, where machinery is operated. I have found it necessary to cut a hole in the floor, plant a post in the ground to support the meter; leave a space between the post and floor to prevent the post from taking up the vibration of the building. To avoid dampness, extreme heat and dust, be extremely careful in all cases to have your meter perfectly level.

The location of meters in residences is often as difficult. By all means, if possible, get your meters located on the first floor. A convenient place usually is in the back hall. First, as you of experience will know, consult the lady of the house as to where she does not want it, then you may have your choice without any disturbance. A good place is on the wall near a cross wall, or a T, just as far from a door as possible. It may be put in any room of the house except the kitchen. Put it outside before putting it in the kitchen. In fact, I have some meters for residences outside under the gallery giving good service. They require cleaning oftener, owing to our high winds bringing so much dust. No matter how careful you may be, it is hard to keep dust out of a meter. I have found a strip of soft, thin felt and a little glue put around where the cover comes down to be a great help. Vibration and dust cause our principal trouble with meters, while in colder climates insects bother a great deal, owing to the warmth of the inside of the meter. Still, they do not have so much wind in the North, consequently not so much dust, so it is about equal.

When a new meter is put in service it should be examined often, but after a year's faithful service, it will not be necessary to examine so often. I find a great difference of opinion on the care of meters, as to when and how to clean them. In my opinion the place to inspect, clean and repair a meter is in its position on the wall where it does service. Do not take the meter down to the shop, laboratory, test room or whatever you may have.

THE NECESSARY APPLIANCES FÓR CLEANING METERS,

First, you need wrenches to fit the nut and jewel pin. A pair of bellows for dusting out.

Do not use a brush at all. If your meter has permanent damping magnets, you need a thin piece of steel of suitable shape for cleaning particles of metal off the magnet. You should also have a small level to see that the meter is still in position. If your meters have commutators you should have a piece of narrow cotton tape; also a piece of fine crocus cloth. With these necessary appliances, we can now proceed to clean a meter. Lift the cover. Any dust which may have accumulated should be removed with the bellows. The condition of the jewel should be tested. If the surface feels rough, you are liable to have an injured jewel as well as shaft points. Then it is necessary to replace them; take your thin piece of steel made for this purpose and remove any particles of metal held by the damping magnet. Then place the piece of narrow cotton tape around the commutator under the brushes, and take one end in each hand, move it quickly back and forth, revolving the armature slowly. Repeat this until you have a polished surface. After this examine commutator with microscope to see that no lint is left on it. Make the necessary test, see that the meter moves off at proper speed; now replace the cover and a new seal, for meters should always be sealed. Pardon the use of the Scripture, "The first shall be last and the last shall be first." First, all of you should sell your customers a meter. Many will say we can't, but I say you can. Realizing that the rental or free system prevails throughout the United States, still it is a portion of that evil that has not yet been overcome.

#### THE GASOLINE AUTOMOBILE\*

#### BY C. J. FIELD.

I will try to give you a brief review of the development of the gasoline vehicle, here and abroad, as far as it has gone. The gasoline type of automobile is a product, you might say, of foreign manufacture largely up to a very recent period. The gasoline type of vehicle has been developed abroad, especially in France and Germany, and more lately in England, to a much greater extent than any other type of vehicle has been in those countries, largely due to the fact that the gasoline engine had been brought to a higher state of perfection and development over there than we have had it here; and also due to the fact, possibly, that electrical machinery was not so familiar to them, and the facilities for charging the batteries, etc., were not as good as in this country.

On this side, the electric vehicle, has, beyond question, up to the present time, taken a most prominent position in the minds of the public and as regards the number of vehicles introduced. This is due to the general facilities in all our larger cities for readily obtaining a recharging for our batteries. I do not intend to-night to take the position that the gasoline automobile or any one type of vehicle will meet fully the requirements of all conditions for pleasure automobile purposes or motorvehicle purposes. I believe from an electrical and mechanical engineering standpoint that each type of vehicle has its field of usefulness. Each one is going to develop more fully and broadly; and I do not think any of us is prepared to-day to take a positive stand as to which is the best. The electrical vehicle has its use for pleasure purposes in our cities where facilities for charging are readily secured, and where the question of expense and maintenance is not a paramount matter, and where the range of action, or length or range of trip you want to take with it is limited to an afternoon drive of two or three hours: in such case beyond question it serves our purpose well. But as I look at the matter, and as the public and engineers as a whole are considering the matter, that does not meet all the requirements to which the automobile must be made adaptable, if it is to take the prominent position it should. We are going to retire the horse to a limited field of usefulness in the next few years and take him from the street for general traction purposes as markedly as the electric railway has taken the horse from the streets in the traction of street cars in this country and others. But I fully believe that that development is going to be carried along not only by electric automobiles, but by gasoline and steam automobiles. The gasoline automobile, I feel, will occupy a middle ground, serving for pleasure and commercial purposes more particularly as it is being developed now, and promising a more general fulfillment of the conditions exacted than the other types. The electric automobile will confine itself to the pleasure class of vehicles, and to some limited extent for commercial uses on city delivery purposes. The gasoline automobile with the promises of future development which we have at hand will be used for general pleasure purposes and also to meet the requirements of commercial trucking and business demands. The steam automobile I will leave to my friend who follows me to explain its field of usefulness.

The first part of the gasoline vehicle to be considered is the motor. The type of motor in general use that we are familiar with is the four-cycle motor. The two cycle type of motor is practically not considered at all at this time in the motor vehicle service. The four-cycle type of motor, we understand, consists of a four-cycle operation; the first stroke drawing in a charge or mixture of gasoline and air, the the next stroke compressing that mixture through a higher atmospheric pressure. varying from 40 to 70 pounds pressure, the next stroke, being the useful stroke of the four, in which the charge is exploded and the piston driven forward. The fourth cycle is the one in which the exploded gases are expelled from the cylinder, and the cycle commences over again as just described. Therefore, with a single cylinder gasoline engine, we have one useful stroke in four. Multiplying our cylinders, taking two cylinders, we have one useful stroke in each revolution. If we have four cylinders we have two useful strokes in each revolution, if they are properly proportioned and divided. So, although as compared with a steam engine, the four cylinder gasoline engine only represents in the number of useful strokes the equivalent of a double acting single cylinder steam engine, owing to the higher mean effective pressure we carry; it is the more simple, in that the whole plant is concentrated in one motor and we have the acme of simplicity for a type of motor of that class.

These gasoline motors are divided into two classes. The first one being called the flange cooling type of motor in which the heat produced by the explosive charge is kept down to reasonable limits by the radiating of the heat from the cylinder by flanges cast on it. These flanges are thin and comparatively close together and the cylinder casting radiates the heat due to the explosions, provided the motor is placed in the proper location on the vehicle so

as to be freely accessible to draught of air while the vehicle is moving. This type of motor brings us down to the minimum of weight and simplicity of the gasoline motor for its size. But the size of the motor of this class is limited to about two or two and one-half hp. for a single cylinder of any reasonable service.

We have heard of troubles in operating gasoline motors and many of us have experienced these troubles with many of the types of gasoline motors on the market. I believe that 90 per cent. of the troubles in operating gasoline motors are due to poor electrical engineering. (Laughter.) Ninety per cent. of these troubles occur with the part of the motor which the electrical engineers of this country are going to properly comprehend and put in first-class working shape, so that the gasoline motor will be as reliable as the electric or steam motor for general purposes. Where we come to larger power than our flange cooled engine will develop, we have to use a water-jacket and some additional apparatus in the way of water circulating tank for cooling the engine. This coil represents the most efficient plan of French radiating ribs, being a thin pipe in which the copper disks are pressed closely to one another, and the coil being placed in the front part of the vehicle down on the axle, being connected up with the water tank on the inside of the vehicle, the water circulating through the coils, the action of the air passing over the coils cooling the water and keeping it below the boiling point; also keeping down the loss of water. In the latter type of vehicles, the weight of water necessary to be carried is reduced to a moderate basis, so that one to four gallons serve the purpose for a one to two days' trip, with a small loss due to evaporation.

In the gasoline automobile one of the most difficult parts of the problem is the proper vaporization of the gasoline. It is accomplished by two methods. One is called the tank method or carburetor, and the other method is the vaporizer. In the tank method, we have a body of gasoline carried into a tank, and down through the air valve; the air circulates across the surface of the tank and passes up into this valve and from that down to the engine. The air as it passes across the surface takes up a certain amount of gaseous vapor with it and goes into the valve and is controlled in quantity, while at the other end of the valve fresh air is admitted and mixed with the vapor and passes to the cylinder, being drawn in by the inlet suction stroke of the The exhaust of the engine passes through the gasoline for the purpose of warming it and assisting in the vaporization of the gasoline, so that the air will take it up. This method has been largely used abroad on small vehicles of the quadricycle and tricycle type. It is not, however, a method that has proved satisfactory for larger vehicles or on rough roads, due to the fact that when the gasoline is shaken up, the quality or richness of the mixture varies and gives us trouble in the proper operation of the engine, and entails a constant adjustment by the operator of these two valves in relation to the mixture, so that now we have in more general use for the larger type of vehicles vaporizers which work better under these conditions.

One of the types of vaporizers which is now in general use is called the floating valve system. It has a small chamber, in which a floating cylinder controls the needle valve by action of the levers. In ordinary service the gasoline is nearly opposite this nozzle. When

<sup>\*</sup> A paper read at the 204th meeting of the New York Electrical Society, New York City, March 22, 1900.

the gasoline falls below it, the float comes down and opens the needle valve and the gasoline flows in. The action is automatic. The gasoline is carried along up into the nozzle so that at the level it is just below the opening. When our engine sucks from one end it draws the gasoline from the other. At the same time it also draws in hot air at this inlet which, coming in contact with the spray of gasoline, vaporizes it, the hot air being drawn by contact with the exhaust and warmed. As it passes out, it is joined with cool air and both mixing together form one explosive charge. The principle is simply one of drawing hot air automatically and vaporizing our gasoline spray, and then mixing it with cold air before it passes to the engine cylinder. We can readily regulate the speed of the engine by varying the quantity of cold air by valve adjustment at the opening. The exploding of the vapor is done in general by one of three methods. The method which was first used and is still considerably used abroad, is the hot tube method, being a platinum tube heated up by a lamp and exploding the charge of vapor by the incandescence from that tube. The disadvantages of this method are several. One is that the time of explosion is a fixed one and therefore the speed of the engine is a fixed and constant factor. Another disadvantage of the method is that it introduces an element of danger in the operation of the gasoline vehicle due to the lamp. In case of any accident, involving the overturning of the vehicle, the lighted lamp is an element of danger, provided it comes in contact with the vapor, as has been the case in one or two serious accidents. reason for the introduction of the hot tube method was to insure a fairly reliable method of exploding the charge due to poor mechanical engineering in not being able to arrange a proper spark-exploding method. At the present time in this country, however, we are almost universally using the "jumping spark" method for exploding the charge. We are able by this method to vary the speed of our engine and vary the time of exploding the charge by a cam-action on the auxiliary shaft, being, able to vary the time of contact of the cam and changing the time of the explosion.

One of the difficulties we have to contend with in the gasoline vehicle is we have not the flexibility of the electric motor for readily varying our speed. We are placed in this position-although we can vary the speed of the engine, we cannot reduce down and get the full power of our engine. To get the maximum power of our engine we have to resort to some method of variable speed gearing which will enable us to get the maximum power out of the engine. That part of the mechanism, up to almost the present time, has been in the most crude shape of any of the mechanical features of the vehicle. There has not been up to this year on any gasoline vehicle what might be termed a first-class mechanical, economical and efficient type of variable speed gear. In general they have been a meshing of plain gears, one into the other, while they were running, throwing them into the mesh sidewise. Nominally, the vehicle should be brought to a stop and the gears thrown in. In ordinary service a layman will try to change his speed while moving and the result would be a complete disarrangement of the gears. One of the clumsy methods, being two bevel gears and two other gears which are thrown one into the other, and in that way they secure some slight modification. They will, however,

come out in some of the new vehicles this year, here and abroad, a good, efficient type of variable speed gear in which the gears are always in mesh and are giving us good mechanica efficiency and enable a ready change of speed for maximum power in hill climbing.

One of the points in connection with the frame construction of our vehicles, common to all electric, steam and gasoline, is the question of the steering point. As Mr. Riker did not touch upon it I will try to cover it briefly. We do away in the motor vehicles with the question of a fifth wheel, and turn the two front wheels by a steering arm pivoted at the back or inside the hub. The object we want to accomplish from the steering end is the reduction of the leverage to the minimum point, or the practical elimination of it, and steadiness

#### AT WORK IN A LAMP FACTORY

We are able in the accompanying illustration, through the courtesy of Bryan-Marsh Co., to show that rara avis, the interior of a lamp factory. The four rows of operatives seen are technically known as stem-makers. They take a glass tube and, after inserting in it the platinum wires, heat the glass, melting it around the platinum, thus making a seal to preserve the vacuum of the lamp when the tube has been sealed inside the bulb.

The output in finished stems in the room shown is nearly 25,000 a day at full capacity making plain stems, but in this factory, which is located at Mariborough, Mass., the highest capacity is below this figure, since a large portion of the lamps manufactured are the Bryan-

INCANDESCENT LAMP STEM MAKERS AND FLANGE ROLLERS.

in steering. One of the best methods for doing this was invented by Mr. Riker. The old-style arrangement, in which the hub is pivoted vertically outside of the rear and the steering arm off from the back, has the disadvantage of a leverage against our steering arm, due to the difference of the plane of this arm and the plane of the wheel which sometimes amounts to a variation of from four to six inches, which makes a serious objection, particularly with any wide vehicle, and requires quite an exertion on the steering handle. There is also the disadvantage that when we strike an obstruction it carries the shock to the frame.

## Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended April 21:

Argentine, 65 cases, \$5,176; Australia, 64 cases, \$5,257; Brazil, 283 cases, \$16,002; Bremen, 4 cases, \$500; Berlin, 4 cases, \$60; Bristol, 7 cases, \$1,132; Central America, 157 cases, \$6,317; Chili, 3 cases, \$101; Cuba, 306 cases, \$46,299; Dublin, 3 cases, \$125; Genoa, 6 cases, \$50; Glasgow, 218 cases, \$21,652; Havre, 145 cases \$8,361; Hamburg, 31 cases, \$5,023; Kirf, 2 cases, \$30; Liverpool, 98 cases, \$5,220; London, 150 cases, \$10,949; Manchester, 1 case, \$60; Mexico, 221 cases, \$4,991; Newfoundland, 1 case, \$19; Peru, 20 cases, \$2,532; Philippines; 50 cases, \$525; Santo Domingo, 6 cases, \$57; Southampton, 15 cases, \$616; U. S. Colombia, 2 cases, \$248.

Marsh Double Filament type, which is somewhat more expensive to manufacture than the older types, but the results obtained are so far superior that the additional cost entailed is justified. By using two filaments, which are in series, great length of carbon is secured, together with a high percentage of flashed or treated surface of graphitic carbon, which is much superior to the core or base carbon, as it better withstands the high temperatures at which the filaments must be run in modern efficient lamps.

#### SOCIETY NEWS.

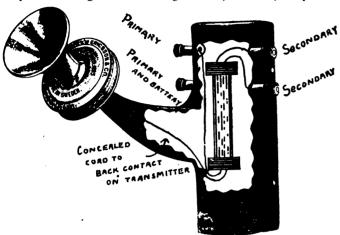

### American Institute of Electrical Engineers.

The 141st meeting of the Institute will be held at 12 West 31st street, New York City, this (Wednesday) evening at 8 o'clock. A paper will be presented by Arthur H. Ford, entitled "Hysteresis in Sheet Iron and Steel."

Applications have been received from the following candidates for associate membership, which will be acted upon by the council at its meeting May 15: J. S. Viehe; Bethlehem, Pa.; Irving B. Smith, John A. Lafore, Philadelphia, Pa.; Richard R. Bryan, Atlanta, Ga.; Frederic E. Town, Louis D. Bliss, Washington, D. C.; Ernest M. Archibald, Halifax, N. S.; S. A. Dyer, Chas. E. Johnson, Mexico City, Mexico; Philip W. Davis, Cambridge, Mass.; Arthur L.

Robinson, Charlotte, N. C.; Anderson Offutt, New Orleans, La.; Clarence Thomson, J. A. G. Trudeau, John Murphy, Ottawa, Canada: Howell J. Rossi, Puebla, Mexico; Augustus J. Bowie, San Francisco, Cal.; Herman L. Wallan, Brooklyn, N. Y.; Carl Leonard de Muralt, Paris, France; Edward J. Cook, Cleveland, O.; Arnaldo P. Zani, Milano, Italy.

The next meeting will be the annual business meeting to be held in New York, Tuesday, May 15. The general meeting will begin at

Philadelphia, in the afternoon of May 16. Paris meeting, August 16.

#### LEGAL NOTES.

The Sycamore (Ill.) Electric Light Company has gone into the hands of a receiver, Cassius M. Conrad being appointed. He will sell the plant at public auction on May 2.

The State Supreme Court of Montgomery, Ala., has decided the case of a street railroad company which enforced a rule that whites and negroes should occupy the separate portions of the car set apart for them. A negro woman was put off the car for refusing to obey the order and she sued for damages. The lower court and she sued for damages. The lower court decided in favor of the railroad and the Supreme Court affirmed the decision.

The Clyde Gas and Electric Company of Clyde, N. Y., has gone into the hands of Edward Moir of Marcellus, temporary receiver, by order of Justice Davy, upon a petition for voluntary dissolution. The corporation is insolvent. The capital is \$40,000, all paid up.

Judge Brannon, of the Supreme Court of West Virginia, has handed down an important decision in the case of the Clarksburg Electric Light Company vs. the City of Clarksburg, holding that a municipal corporation cannot grant a franchise for exclusive privileges. is contrary to the general practice heretofore.

The Chicago General Railway Company recently passed into the hands of a receiver, Judge Tuthill appointing Frank H. Sellers, trust officer of the Title Guaranty Trust Company, on petition of John H. Witbeck, former president of the company.

### PERSONAL MENTION.

Mr. F. J. Stout has accepted the position as general manager of the Toledo (Ohio), Fremont & Norwalk Electric Railway. The appointment is effective May 15.

Mr. Ellis E. Brown, formerly connected with the Poly technic School of Worcester. Mass., was lately appointed electrical engineer of the Reading (Pa.) Railway Company His headquarters will be at Reading.

Mr. Augusta Curtis Palmer, an aged resident of Utica, N. Y., died at his home a short time ago. Mr. Palmer, it is claimed, invented many valuable electric devices, and was the patentee of the first fire alarm system used in Utica.

Mr. Justin R. Carrier, formerly superintendent of transportation of the Syracuse (N. Y.) hapid Transit Railway Company, is now the superintendent of transportation of the Connecticut Lighting & Power Company and the Bridgeport Traction Company.

#### COMMERCIAL PARAGRAPHS.

#### Popular Telephones.

The attention of one of our representatives has been called to the growth in the demand for the Ericsson Telephone Company's goods, whose offices are at 296 Broadway, New York City, and we have been interested in having some of their good points explained to us.

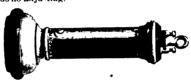

We illustrate the Ericsson Adjustable Arm Transmitter nade with cord concealed and induction coil in the base. The transmitter is the genuine Ericsson, imported from Stockholm, Sweden, and is so arranged that it can readily be put in place on the arm of the transmitter or taken off, if

for any reason it is desirable. The spring Sacoro ART live and makes a good connection. The transmitter is held firmly in place. of the arm by a screw coming through the iron of the arm and into a slot in the back of the transmitter.

> The arm adjusts conveniently up and down and meets the requirements of a short or tall person, and is a convenient length for practical purposes. The advantages of the genuine Ericsson transmitter are too well known for us to speak about them at length, but the Ericsson Telephone Company states that they will give references to those who have used the goods, and who can tell you all about them from practical experience.

> We also illustrate the double pole, horse shoe magnet receiver, which is warranted to sustain 41/2 pounds dead weight, and is made with nickel-plated magnet ends. This re-ceiver fits any standard hook and is an all-

metal receiver, so made that the changes of temperature will not affect the adjustment, hence it is "never changing ' and needs no adjusting.

This company is making a specialty of the Ericsson Talk ing Circuit, consisting of the adjustable arm transmitter with cord concealed, the Ericsson receiver, induction coil and receiver cord. The great advantage of this Talking Circuit is its equality or even balance, meaning the balancing of the resistance of the two circuits by the use of this special induction coil, which makes the Talking Circuit superior to all others, either for short or long distance work, and produces the best results. For proof of this they refer to numerous customers, who are not only growing in number, but whose requirements are constantly increasing for their different exanges. Many customers are substituting this Talking Circuit for the one originally supplied with instruments, finding that the Ericsson is so far superior and that it is an economy to make the change.

The Ericsson Company make a varied line of complete instruments, which we are unable to illustrate at this time, together with switchboards for ground line and metallic circuits, also multiple switchboards up to the highest capacity.

## Removal Notice.

The Standard Underground Cable Company announces the removal of its New York offices on April 30 to more commodious quarters at No. 56 Liberty street (corner of Nassau). and at the new location will be glad to welcome its customers and friends.

#### INCORPORATIONS.

The Union Electric Light Company, Hackensack, N. J. Capital stock, \$25,000. Incorporators: Genest W. Ottignon, George T. Davison and John J. Bate.

The Delaware and Susquehanna Electric Light Company, Cecil County, Md.-to build a railway from the Susquehanna River to the Delaware State line and construct the necessary branches; also to generate and sell electricity. Incorporators: John S. Rossell and others,

The Casper Electric Company, Casper, Wyo.-to furnish light, heat and power. Capital stock, \$20,000. Incorporators: C. H. King, F. Salathe and T. M. Becker, all of Casper.

The Chillicothe & Hillsboro Traction Company, Chillicothe, O .- to build an electric line between the two cities. Incorporators: W. A. Wallace, Edward L. and G. L. Warson, Dayton; M. McKeehan, Hillsboro, and H. T. Glenn, of Cin-

The Osborn Electric Railway Encampment Manufacturing Company, Cheyenne. Wyo.-to manufacture electrical supplies, etc. Capital stock, \$250,000. Incorporators: B. E. Osborn, J. A. McGeer, J. H. Pearson, F. E. Cody and C. F. Parcells, all of Auburn, N. Y.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FORRIGN PATENTS. at 302 and 301 Broadway (Room 1201), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED APRIL 17, 1906.

#### ELECTRIC RAILWAYS AND APPLIANCES.

ELECTRIC RAILWAYS AND APPLIANCES.
647,624. Trolley-Fork. Elias Eddy, New York City. Filed Aug. 9, 1899.
647,637. Switch-Operating Mechanism for Railways. Charles W. Squires and James B. Squires, Springfield, Mass. Filed April 12, 1899.
647,666. Electric-Railway System. John M. Murphy, Torrington, Conn., assignor, by direct and meene assignments, to the Safety Third Rail Electric Company of New Jersey. Filed Sept. 3, 1897. Renewed June 9, 1899.
647,748. Plow for Conduit Electric Cars. James B. Gottsberger, New York City. Filed Jan. 4, 1900.
647,751. Car Brake and Fender. John D. Long, Chicago. Ill. Filed Nov. 6, 1899.
647,889. Trolley-Wheel. Charles S. Johnson, East Liverpool, O. Filed Jan. 24, 1900.

## GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Alliance, O.—O. W. Pfouts, city engineer, has pre-pared plans and specifications for the erection of an electric light plant at this place.

Beaver Dam, Wis.—The property of the old electric light company was recently turned over to the new company. The capital stock of the latter will be \$52,000. The plant is to be entirely rebuilt.

Cheney, Wash.—The project of supplying electric power and light at this place from Spokane Falls, 16 miles away, is under consideration by the proprietors of the water power.

Chicago, O.—This town has voted to issue \$15,000 in bonds for an electric light plant.

Conemaugh, Pa.—This village will receive bids in about a month for an electric light plant to cost \$12,500 and run forty 2,000-cp. arc and two thousand 16-cp incandescent lights. Address S. M. Snyder.

Eaton Rapids, Mich.—The Hughes & Welch electric lighting plant is to be enlarged and improved. A new dyname with double the capacity of the present one will be purchased and the power increased.

Elkader, Is.—Messrs. Stopps & Williamson have been awarded the contract to erect an electric light plant

Fredericksburg, Va.—The council has authorized the light committee to advertise for bids for erecting an electric light plant.

Gaffney, S. C.—There is to be an electric light plant erected on Broad River at this place.

Galena, Ill.—The city council has decided to purchase a site and erect thereon an electric lighting plant. Georgetown, S. C.—The Georgetown Electric Com-

Georgetown, S. C.—The Georgetown Electric Company wants estimates on a complete electric light plant.

Hartford, Conn.—Thomas C. Perkins of this city, representing Hartford and Boston capitalists, has been trying to interest the Warren selectmen and the officials of the towns of Brookfield, West Brookfield and North Brookfield, Mass., in an electric light plant and furnish streat lights. to furnish street lights.

Lakewood, O.—Bids will be received in July for erecting a plant to cost \$15,000 to operate 100 arc lights. Address R. F. Wood, engineer.

Litchfield, Conn.—The Litchfield Electric Light & Power Company is preparing plans for a new electric light plant.

Lowellville, O.—B. P. Foster of Cleveland has been awarded the contract to erect an electric light plant

Madisonville, O.—The issuance of \$10,000 in bonds for an electric light extension will be voted on at a special election this month. Address Village Clerk B. Carter.

Marianna, Ark.—The electric light plant of the Marianna Gin & Manufacturing Company was recently destroyed by fire.

Morris Plains, N. J.—An appropriation for the installing of an electric light plant at the New Jersey State Hospital for insane persons will be asked for.

Nashville, Tenn.—The city council has passed the bill to issue \$150,000 worth of bonds to build an electric

New Wilmington, Pa.—An electric light plant is to be erected here.

Osgood, Ind.—J. Eckert is chairman of a special committee appointed to secure data, etc., for a municipal electric light plant to furnish fifty 1,200 candle power arc and six hundred 16-candle power incandescent lights.

Palatka, Fla.—T. B. Anderson, city clerk of this place, advertises for bids for lighting the city for a term of five years.

Pittaburg, Pa.—The Pittaburg & Lake Erie Railroad Company will erect an electric light plant on Smithfield street.

Pocomoke City, Md.—This city will soon vote on the question of issuing bonds for erecting an electric light plant. R M. Stevenson, mayor.

Beading, Pa.—An electric light plant will soon be installed in St. Joseph's Hospital at this place.

Biverside, Cal.—At a recent election it was voted to issue \$40,000 in bonds for the purpose of erecting an electric light plant.

Shakopee, Minn.—A petition signed by over 150 citisons was presented to the common council asking that
body to submit to the votors of the city the proposition
of issuing bonds, to be used in building and operating
an electric light plant.

Shreveport, La.—The W. K. Henderson Iron Works of this city is in the market for a dynamo of 100 lights.

Southampton, N. Y.—The council has granted a franchise to W. B. Betts for an electric light plant.

South River, N. J.—This town will build an electric light plant to run 40 arc and 500 incandescent lights.

Thomaston, Ga.—The city council desires to establish an electric light plant or to contract with individuals for lights for streets. Bids are solicited. Address T. Adams, clerk, Thomaston, Ga.

#### STREET RAILWAYS.

Charlotte, N. C.—President Orr, of the Anderson (S. C.) Water, Light & Power Company, has submitted a proposition to the town council for a franchise to construct an electric street railway in this place.

Dayton, O.—The contract for the construction of the Dayton and Troy line has been let to John W. Coffman, of New York City. The line will extend along the Dayton and Covington pike, and will take in Harrisburg, Union, West Milton, Pleasant Hill, Ludlow Falls and Covington, and then extend from Pleasant Hill to Troy.

Delaware, O.-D. E. Sullivan and T. A. Simons of Columbus have secured the right of way to construct an electric road from Worthington to this city. Work will soon begin on its construction, and an electric power plant will be located at a point between Columbus and Delaware which will cost \$50,000.

Glenside, Pa.—A proposition to build a five-mile trolley line from Branchtown to this place is being promoted by William T. B. Roberts, the real-estate operator, who has 550 acres of land here that he proposes to make available for improvement by the construction of this line.

Jersey Shore, Pa.—Permission has been granted to the Jersey Shore Electric Street Railway Company to erect poles, lay tracks, and run cars through certain prescribed streets of this town.

La Porte, Ind.—The commissioners of La Porte County have granted a new franchise to the Northern Traction Company, who propose to build an electric line from Michigan City through La Porte to South

Lockport, N. Y.—The Lockport & Olcott Railway Company with a capital of \$200,000 was recently formed to build a trolley line through Niagara County from Lockport to Olcott. W. Van Horn, W. V. Corwin, H. J. Pierce and J. E. Pound are the directors.

Mountainside, N. J.—The residents of this borough will present a petition to the Westfield & Elizabeth Street Railway Company, asking that this place be included in the route of the trolley line to Springfield.

Orange, Mass.—The question of building an electric railroad from here to Miller's Falls is now being agitated. It is claimed it will cost about \$150,000, and if patrons along the line of the road will subscribe to the amount of \$50,000, the company will furnish the other \$100,000 and build the road.

Peru, Ind.—A company is being organized composed of capitalists of this city, of which C. H. Brownell and R. A. Edwards are at the head. Its object is the construction of an electric railroad from here to Converse.

Pontiac, Mich.—The promoters of the Pontiac Orion Electric Railway announce that the line will be built as soon as the weather permits. A stock company will be organized with a capital of \$175,000.

Richmond, Ind.—Messrs. Freeman & Lontz, promoters of an electric line from this city west to Cambridge City and other points, have given a \$10,000 bond as a guarantee that the road will be built.

Sterling, Ill.—Diller & MacMillan are the promoters of a scheme to build an electric railroad from here to Dixon, Cregon, Byron and Rockford.

#### COMPANY MATTERS.

Baton Rouge, La—The Home Electric Company has recently been considering the proposition of John D. Fisher, who will in all probability become the purchaser, after which the stock will be bonded and the capacity of the plant increased.

Connellsville, Pa.—The Connellsville & Uniontown Electric Railway Company will build a power house to cost \$230,000. The road is to be extended from Mt. Pleasant to Fairchance via Alverton. Scottdale, Pennsville, Connellsville, Dunbar and Uniontowa. The plans also include a line from Scottdale to Pittsburg via West Newtown and Monongahela City. The right of way has all been secured. of way has all been secured.

Huntsville, Ala.-The Huntsville Railway, Light & nuntsville, Als.—Ine Huntsville Kallway, Light & Power Co. is making extensions in its power house, and will put in new machinery for electric street lighting. An extension of the railroad to Monte Sano is generally believed to be one of the immediate probabilities of the year. President Dupont has the matter under advisement.

ment.

Indianapolis, Ind.—The Power Building Company, with a capital stock of \$300,000, will soon begin the construction, at New Jersey and Washington streets of an immense building that will furnish to manufacturers space, power, light, heat, etc., at nominal cost. Power will be produced by compound engines and direct-connected electric generators. The building will be heated by hot water and lighted by electricity.

Ludlow, Ky.—The Kentucky Electric Company has increased its capital stock to \$50,000 for improving its

Marion, Ind.—The Marion Electric Company receive bids about May 15 for a new power house and two 250 hp. boilers, engines, dynamos, etc.

dent Altred Skitt of the Manhattan Elevated Railway Company to the Department of Buildings for a three-story electric power house for the new third rail system, which the company is about to substitute for the pres-

ent motive power. The structure will cast about \$750,000. It is to be erected in Exterior street, between The structure will cust about Seventy-fourth and Seventy-fifth streets.

Xenia, O.—The Xenia Electric Light & Power Company has increased its capital stock from \$10,000 to \$50,000 to improve its plant. J. D. Steele is president.

#### MANUFACTURING.

Chicago, Ill.—J. M. Atkinson, W. E. Pimlott and J. S. Cummings of this city are the incorporators of the J. M. Atkinson Company, which was recently formed to manufacture electric machinery and supplies—The Osburn Electric Manufacturing Company of this city has changed its name to the Electric Supply Company.

Cincinnati, O.—Moritz Boninber, a capitalist from Cologne, Germany, was recently here purchasing electric machinery. He closed a contract with W. G. Wagenhals, president of the W. G. Wagenhals Manufacturing Company, for the use of his slow-feed electric handle used on electric cars, for all Europe.

Cumberland, Me.—A company known as the Cham-pion Electric Belt Company with a capital of \$500,000 will manufacture and deal in all kinds of electrical ap-paratus and letters patent for similar devices.

Utica, N. Y.—With the awarding of a contract to the firm of I. P. Morris & Co., Philadelphia, for the manufacture of four large water wheels, the Utica Electric Light & Power Company made the last necessary provision for the construction of the plant, which is to be the means of converting the power at Trenton Falls into currents of electricity to be used for illumination, and for purposes of manufacture in this city.

#### POWER AND TRANSMISSION PLANTS,

Athena, Ore.—The company formed here to harness the power of the Walla Walla River, has finally decided the power of the Walla Walla River, has maily decided to go shead and inaugurate the enterprise. A plant to cost \$100,000 will be installed, and power will be transmitted from the upper waters of the Walla Walla River to Walla Walla, Wash., and to Athena and Weston, Ore.

ton, Ore.

Burlington, Vt.—The Vermont Electric Company has purchased the water rights north from the Hunter & Shiland dam at Essex Junction, up the Wincoski River to the termination of the rapids of S. E. Brownell. The scheme proposed by Manager Dr. W. S. Vincent is for the building of a dam across the river where it is about 300 feet wide; and also the erection of a power station. A generator of 2,000 horse power will be installed, and connections will be made with the gorge power station by means of the three-wire system.

Congwinge Md.—Suppose have been applied for

Conowingo, Md.-Surveys have been completed for conowingo, Md.—Surveys have been completed for the great hydro-electric works on the Susquehanna River near this place. The works will be of the magnitude of those at Niagara, and it is expected to furnish electrical power to Philadelphia and Baltimore. The first station to be erected will contain water wheel and dynamo capacity for 59,000 electrical horse power.

and dynamo capacity for 57,000 electrical horse power.
Leadville, Col.—A company headed by several
wealthy mine owners, including John F. Cambian,
Seeley W. Mudd, William Byrd Page and Charles Baettcher, proposes to establish an immense water-power
electrical generating station on Esgle River, twentythree miles from this city. The present plans contemplate four three-phase units of 1,000 kilowatts each,
and the full capacity has already been contracted for.

and the full capacity has already been contracted for.

Watertown, N. Y.—Last year the Black River Traction Company purchased a water power on Black River between Felt's Mills and Great Bend, and plans are now being formed for the erection of a power plant on this water power site. The current will be brought to this city and with one storage battery at Dexter will operate the road.

## AUTOMOBILES.

Akron, O.—This city is the possessor of the first automobile patrol wagon in this country. It is of the electric type, being driven by two six-horse-power motors, capable of a maximum speed of 20 miles an hour. The battery is of 40 cells, and one charging will carry the vehicle 25 miles. An electric headlight and an electric alarm gong give warning of the approach of the vehicle, while a smaller light in the top of the wagon gives ample illumination for the interior. In actual service it has been run through mud six inches deep, with as many people in it as could be seated.

Zylonite. Mass.—It is stated that the plant at this

Zylonite, Mass.—It is stated that the plant at this place, which was formerly a celluloid industry, will be henceforth devoted to the manufacture of automobiles. A sample machine was made and sent to New York. This proved so satisfactory that the projectors of the plan will commence at once on a large scale the making of these machines.

Idaho Springs, Col.—The Pine Shade shaft is sinking by hand, but it is expected that arrangements will be made for the installation of electricity, overtures having been made by Manager May of the Seaton Company to the Idaho Springs Electric Company, with a view of running wires from the town to the mine.

# THE TELEPHONE WORLD.

#### Municipal Telephones for Chicago.

A dispatch from Chicago says that city is to have a municipal telephone system. Its immediate use is to be confined to the Police and Fire Departments, but its projectors say that eventually it will serve as the nucleus of a great metropolitan system that is expected to become a healthy rival to the Chicago Telephone Company and the New Illinois Telephone & Telegraph Company. Rates sufficiently low to make the telephone a cheap convenience are predicted by those who see a great future in the municipal plant.

The infant telephone system was launched on Friday, when City Electrician Ellicott advertised for bids on 1,500 instruments. Later he will ask for prices on enough insulated wire to make the necessary connections. The conduits have been completed, so that with the purchase of the apparatus, no delay will be met in installing the system. The Chicago Telephone Company has had an annual rental of \$8,000 from the city.

#### Telephone Men Active in the Bay State.

Franchises for competing telephone companies have been granted by the cities of New Bedford, Fall River, Springfield and Brockton, Mass., within the last few months. The exchange at New Bedford will be in operation on June 1, and the construction in Fall River has already been begun. Springfield and Brockton are to be started immediately. We are informed that the New England Telephone & Telegraph Company has again reduced its rates in Haverhill, making a special line rate of \$54, in place of \$96, and \$36 in place of the \$57 rate for party line, unlimited service. These rates include a free residence telephone, making the New England rate to-day about 25 per cent. of what it was in Haverbill. before the People's Telephone Company began operations. These other cities of Massachusetts have been convinced of the benefits of competition largely through the efforts of the People's Telephone Company, which has been so successful in lowering the price and improving the service in Haverhill.

The Bell Telephone Company of Buffalo, N. Y., will soon commence the construction of its new line from Buffalo to Rochester. The new line will connect with the present line from Le Roy to Churchville at Bergen. It will then be extended from that village east along the State road, thence down the Bromley road to Chili station, where a new office will be opened. From there the line will follow the Central tracks to Rochester, keeping on private property the entire distance.

The Cumberland Telephone Company has withdrawn its construction forces from Louisiana, and has ordered them into Mississippi, as a result of the present local agitation against the telephone companies in New Orleans. Work is not to be resumed in Louisiana until the State Railroad Commission has decided the cases\_pending before it.

The Mariaville and Schenectady (N. Y.) Telephone Company has recently been organized. The new company has purchased piles, and expects to have its line in working order by May 15. The officers are as follows: President, R. C. Cullings; secretary, C. A. Cullings; treasurer, D. N. Walpole; directors: Frederick Frost, Samuel Robinson, D. N. Peck and Delmont Gregg.

Articles of incorporation of the Dubuque (Iowa) Telephone Company have been filed with the county recorder. The incorporators are V. H. Stevens, R. W. Stewart, J. H. Ellsworth, O. J. Hager, D. A. Howe, C. A. Beeman and L. J. Cass. The capital stock is \$100,000, divided into shares of \$100 each. The amount paid in is \$25,000. The purpose of the company is to maintain a telephone exchange in Dubuque.

The Central Union Telephone Company of Indianapolis, Ind., has decided to make a number of changes in its business methods beginning the first day of May. There will be two divisions of the company's system—one in northern and one in southern Indiana. The headquarters for the northern division will be South Bend and Indianapolis will be the southern headquarters.

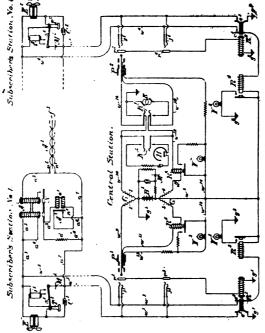

The San Jose (Cal.) Telephone Company has filed articles of incorporation in the office of the Secretary of State of California, the capital stock being placed at \$250,000. The articles show that it is the intention of the company to extend its line from San Jose to San Francisco.

After a hot fight in West Superior, Wis., waged by those favoring the opposing telephone companies, the council has voted to refuse to allow the local Bell Company to maintain telephones in the city hall.

The list of telephone subscribers in Cincinnati is 1,000 greater now than it was a year ago, and applications are being made at a rate each day that is surprising.

## A Telephone and Electrothermostatic Fire Alarm System.

The United States Patent Office issued letters patent on April 17 to George K. Thompson on a combined telephone and electrothermostatic fire alarm system, herewith illustrated. The claim made by the inventor is as follows: "In a common battery telephone exchange, the combination with a subscriber's outfit at a subscriber's station, the line leading therefrom to the central station, the common source of elec tromotive force, and the electromechanism at said central station adapted to be used in connection with said subscrib-

er's station, of an electrothermostat, in a branch parallel with the branches containing the instruments of said subscriber's outfit, adapted when operated by heat to close a circuit over said subscriber's line and set up therein a current from said common source of electromotive force, a continuously-acting circuit-modifier, an electromagnet so arranged that the said current established by the operation of said thermostat will pass through its winding, and an armature for said electromagnet in electrical connection with said continuously-acting circuit-modifier and so arranged that, when attracted by said electromagnet, it will make electrical connection with said winding and thereby bring into circuit with said common source of electromotive force said continuously-acting circuit-modifier, substantially as described."

#### Independent Telephone Lines.

The owners of independent telephone lines covering Eastern Kansas and Western Missouri held a convention in Fort Scott, Kan., recently. Reports indicate that the mileage of independent lines is increasing very rapidly and it has been practically decided that a Maltese cross will be adopted as the sign of all independent toll lines.

The Railroad Commission of Louisiana has taken steps to prevent telephone companies from raising their rates as they had announced their intention of doing. Two rules were re-enacted, and amended as follows: There shall be no increase in the rates now charged for rent of instruments, or for the use of public station instruments for conversation, without the consent of the commission; nor shall any rates be put in force at new exchanges, or on new toll lines, or elsewhere, before said rates shall have been authorized by the commission.

At a meeting of the stockholders of the Central Pennsylvania Telephone & Supply Company of Williamsport, Pa., on the 20th inst., it was voted to increase the capital stock of the company from \$1,000,000 to \$1,500,000. A large portion of the increased capital will be used in repairing lines and erecting new ones.

The United Telephone & Telegraph Company, which controls the Maryland Telephone Company and lines in Wilmington, Washington, Pittsburg and Allegheny, has established in Baltimore a plant for the manufacture of all the instruments which will be needed for the conduct of its business.

There are 7,000 telephones in Oakland, Alameda and Berkeley, Cal., and in San Francisco there are 20,000.

#### To Spot Wire-Tappers.

M. J. Jordan of Derby, Conn., has shown his inventive capabilities in a telephone indicator which he will shortly place on the market. The indicator is used on telephones so that any person using the wire can tell in an instant if there is anyone tapping it. The device is placed inside the upper cabinet where the wires and mechanism are concealed, and is so arranged that the moment the receiver is lifted from the hook the indicator will register the number of the 'phone tapped in the central office by the ringing of a bell. The person using the wire can hear the alarm which is sent in as well as the operator, and so accurate is the alarm there will be no question as to who lifted the receiver.

#### The Park Rapids Telephone Exchange.

There are many flourishing exchanges in operation in Minnesota, but probably none more prosperous—considering the time it has been in operation—than that at Park Rapids. This town has a population of but 1,200, yet in spite of this fact the local exchange in three months got over 180 subscribers with a prospect of many more in the near future, As a local paper states "it is doubtful if there is a town of the same size within the limits of the United States where a larger number of subscribers has been secured to a local exchange, nor an exchange that is giving better satisfaction to its patrons." This satisfactory state of affairs was brought about through good management combined with excellent service at low rates, and last, but not least, to the individual efforts of Mr. A. B. Kerlin, president of the Northern Min nesota Telephone Company.

The Keystone Telephone Company ordinance, which conveys sweeping rights to construct and maintain conduits, cables, wires, terminal poles and manholes throughout the city of Philadelphia, Pa., was rushed through councils' electrical committee, Thursday, eliciting little discussion, a few unimportant amendments, and encountering no opposition. The bill went to select council in the regular routine, and was laid over to be printed.

The board of aldermen of Brockton, Mass., by a vote of 5 to 2, granted a franchise to the Massachusetts Telephone & Telegraph Company, which comes into the field as a competitor with the present New England Company. The new franchise reduces the assessment upon the company's gross earnings to 1 per cent., instead of 2, as at first required.

A Boston company is to manufacture a new antiseptic mouthpiece for telephones, having a metal shell shaped to fit the interior of the mouthpiece, with spring tongues to hold it in place, the exposed surface being covered with a quick-hardening gum which carries the disinfectant.

The Chesapeake & Potomac Telephone Company will, within a month, begin the erection of two buildings, to accommodate branch exchanges of the telephone system in Washington, D. C. Sites for the buildings have been purchased.

The Granville (Vt.) Telephone Company has placed a \$2,000 order with a telephone manufacturing company of Chicago for telephones and switchboards for the Salem and Cambridge exchanges.

The line of the People's Telephone Company to Pittston. Pa., has been opened. Work on the company's lines in Scranton will be begun in a short time.

The Home Telephone Company of Buffalo, N. Y., will have its entire system covering that city in operation by the first of May. There are about 500 subscribers.

#### TELEPHONE INCORPORATIONS.

The Hartsville Rural Telephone Company, Hartsville, Ind. Directors: Alvin Swain, James Mehaffey, W. N. Bradley, James Jordan and Thomas Swain.

The Kansas City Telephone Manufacturing Company, Kansas City, Mo.—to manufacture telephone and electrical appliances. Capital stock, \$5,000. Incorporators: E. L. Foutch, F. M. Bernardin, E. R. Boyer, all of Kansas City. Lathrop. Morrow, Fox & Moore, attorneys, Kansas City.

The Brownstown Telephone Company, Brownstown, Ind. Capital stock, \$5,000. Directors: Frank Branaman, C. F. Robertson and I. N. Persinger.

The American Toll Telephone Company, Cleveland, O.—to manufacture machines for toll messages. Capital stock, \$10,000. Incorporators: W. A. Foss, E. S. Kaneen, A. V. Hegeman, L. A. Fanon, B. G. Nichols.

The Panhandle Telephone Company of Childress, Texas. Capital stock, \$5,000. Incorporators: R. H. Norris, B. B. Bates and W. N. Notes, all of Childress.

## SECURITIES. ECTRICAL

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electrical Year from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem if a favor to have brought to their attention any inaccuracies readers may discover in these columns.

a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & Elec. Co. has been issued in the form of income bonds. b Leased to Boston Elevated Railroad Company.
c Owned by Brooklyn Rapid Transit Company.
d Leased to Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co. f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR. g Owned by Atlantic Ave. RR and leased to Nassau system.
h \$30 per share on outstanding capital pa'd as rental by leasee—West Ohicago St. RR. Oo.;
250,100 of stock owned by North Chicago Street Railroad Company.
c Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Company.
j 55 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Bailroad Company; 5625,00 of stock owned by Chicago West Division Railway Company; 5% on \$1,000.
Stock guaranted by West Chicago Street Railroad Company.
h Majority of stock owned by Chicago Street Railway Company; 5% on \$1,000.
Chaslanati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

- \*\*Unitsted. † Full paid. | Outstanding. † Ex-div.
  a Leased to New Orleans Traction Company at 8 % on stock.
  b Leased to New Orleans Traction Company at 8 % on stock.
  c Leased to New Orleans Traction Company at 8 % on stock.
  d Operating the former Met. Trac. system, that corporation having become extinct.
  c Leased to Sid Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
  f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway
  g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.
  h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
  i Leased to Metropolitan Street Railway for 18 % on stock
  t Leased to Metropolitan Street Railway for 18 % on stock
  l Leased to Metropolitan Street Railway for 18 % on capital stock.

  I Leased to Metropolitan Street Railway for 18 % on capital stock.
  n Dividends of 1% % yearly guaranteed by Consolidated Traction Company.
  o Controls by lease the Alleg'ny, Cent., Otitzens' Duquesne, Fort Pitt & Pitt'n Traction.
  p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
  g Leased to Consolidated Traction Company for 8 % on eapital stock.
  s Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
  s Leased to Consolidated Traction Company for 4 % on capital stock.

PASSENGER RAILWAY.

## NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16%@17%c.; Lake, 17%@17%c.; casting, 16%@17c.

The Hudson River Telephone Company has declared a quarterly dividend of 1½ per cent., payable May 1.

The second installment of \$2.50 per share on Telephone, Telegraph & Cable Company of America stock is payable on May 1.

The Chicago Edison Company has declared a regular quarterly dividend of 2 per cent., payable May 1. Books closed April 23 and reopen May 1.

A deal is under way for the merger of the Consolidated Gas Company of Balti-more and the United Bailways and Electric Company of the same city.

The United Electric Securities Company of Boston has declared a regular semi-annual dividend of \$3.5) on preferred stock, payable May 1 to stock of record April

A member of the General Electric Automobile stockholders' committee is reported as saying that enough stock has been deposited to assure the carrying out of the idea to reorganize the company.

In well-informed financial houses it is the impression that the Western Union Telegraph Company will pay its next regular dividend at the usual rate, but that at the next succeeding quarterly dividend period the rate will be reduced.

The Western Union Telegraph Company has completed arrangements for extending \$500,000 five per cent. bonds of the Gold & Stock Telegraph Company for five years from May 1, 1900, at 4½ per cent. The bonds originally were 6s.

The Brooklyn & Rocksway Boach Railroad Company reports for the quarter ended March 31 a deficit after fixed charges of \$5,234, against a deficit last year of \$4 615. The general balance sheet shows cash on hand \$1,110 and a profit and less deficiency of \$51,787

The Consolidated Electric Company has filed papers with the Secretary of State at Trenton, N. J., increasing its capital from \$100,000 to \$4,000,000. The articles were signed by William F. Eidell, president, and C. W. Gouert of Philadelphia, secretary.

The Chicago Edison Company for the year ended March 31, 1900, reports: Gross income, \$2,133,827, increase, \$178,950; net income, \$812,390, increase, \$72,134; interest on bonds, \$265,243, increase, \$2,719; balance, \$547,147; increase, \$69,415; dividends, \$398,072.

The latest quotations for some of the new industrial stocks, not given elsewhere, s: Electric Boat, 25(2): New York Electric Vehicle Transportation, 12(2): w England Transportation, 5½(2): Telephone & Telegraph Company of America 37(4)4; Gramophone, 48(42.

The Albany Railway Company has filed its last quarterly report as a separate corporation. The new consolidated company, of which it is a part, the United Traction Company, has declared a quarterly dividend of 1½ per cent. This is the first dividend of the new company.

On petition of stockholders, Justice Davy, at Lyons, N. Y., appointed Edward Moir temporary receiver of the Clyde Gas and Electric Company. The capital is \$40,000; assets, \$59,000; liabilities, \$61,159. The plant was bonded by the Trust and Deposit Company of Onondags, N. Y., for \$25,000.

A syndicate of ten New York capitalists is said to be formulating a plan for a trunk telephone line from Biston to Chicago with \$50,000,000 back of the plan. An effort will be made to purchase the New England Telephone & Telegraph Company and part of the American Bell system. The proposed rate from Boston to Chicago is \$2.

Work is to begin on Lung Landth, and the landth of the American Bell system.

Work is to begin on June 1 on the new Buffalo, Rochester and Niagara Falls Electric Railroad. Tais road will be about 129 miles in length, which makes it the longest suburban electric line known. Ex-Sacretary of State Allen C. Beach is to be president of the company; ex-Congressman Charles S. Baker of Rochester, vice-president, and William H. Gillette, superintendent.

A dispatch received yesterday from Chicago says that the continued weakness in National Carbon Company stock is attributed to the statement that that company will not only have to compete with the Consumers' Carbon Company, which was organized at Lancaster, O. Saturday, but also with the Spear Carbon Company, at St. Mary's, O., which is reported to be preparing to make all kinds of light carbons and electrodes.

A \$5,000,000 mortguge, made by the Standard Electric Company of California to the Mercantile Trust Company of New York, was recently filed for record in the Recorder's office of San Mateo County. The mortgage covers all real and personal property of the Standard Electric Company, including all its plants, wires, circuits, poles, etc., now used as well as all property, both real and personal, to be hereafter acquired by said company.

Arthur H. Masten, the standing master appointed by Judge Lacombe to pass upon the advisability of issuing receiver's certificates for the Third Avenue Railroad of New York, gave another hearing to the creditors and others interested last week. It was the consensus of opinion that the reorganization of the Third Avenue Railroad was progressing favorably, and that nothing should be done pending the ratification of the lease of the Third Avenue to the Metropolitian Street Railway Company. The hearing was adjourned without action to May 22.

way Company. The hearing was adjourned without action to May 22.

At a recent meeting in this city, the directors of the New York Telephone Company voted to increase the capital stock from \$16,000,000 to \$3,000,000. At this same meeting the question of providing funds for the floating indebtedness of the Southern Bell Telephone Company of \$2,000,000 was also considered. This company is owned jointly by the American Bell Telephone Company and the Western Union Telegraph Company. It is quite probable that an increase of the capital stock will be made in the near future to provide funds to pay off the floating debt and extend the lines of the company in the seven Southern States in which it operates.

The United Railways and Electric Company of Baltimore has sold \$3,000,000 The United Kallways and Electric Company of Baltimore has sold \$5,000,000 of its 4 per cent, bonds to Alexander Brown & Sons. These bonds have been resold by the purchasers to various financial institutions with the agreement that they are not to be offered on the market within six months, and then at not less than par and interest. It is said that the bonds were purchased at 95 and interest. With the money thus secured the company pays off all its floating debt incurred for new equipment, extension of power houses, erection of shops and other requirements in sight for the next year or more. It also applies \$750,000 to the payment of a loan made to supply each to pay off collatoral trust bonds which were paid when they made to supply cash to pay off collateral trust bonds, which were paid when they matured January 1.

Reports that have been in circulation to the effect that the \$7,000,000 increase of the Metropolitan Street Railway was to provide the funds for the purchase of Third Avenue Railroad stock have been authoritatively denied. "The increasing of our capital, as anticipated." President Vreeland is reported as saying, "is to provide the wherewithal to carry out several plans that I suggested for the improvement of our service. At the present time we are pushing to completion work that has been under way for several months." The meeting of the Metropolitan stockholders, to vote on the increase of stock is called for May 17, at which time also the stockholders will be called upon to ratify the purchase of control of the Third Avenue Railroad and its allied companies. The increase of the capital by \$7,000,000 will bring up the total of Metropolitan stock outstanding from \$45,000,000 to \$52,000,000. 000,000.

## EDITORIAL NOTES.

#### The General Electric Company's Eighth Annual Report.

Elsewhere in this issue will be found in full the Eighth Annual Report of the General Electric Company. This report

shows gross receipts for the year ended January 31, of \$23,248,170.45, as compared with \$16,472,-021.68 for the year ended January 31, 1899, or a gain of \$6,776,148.77. Of the total amount taken in there was a net profit of \$5,479,130.20, as compared with \$2,584,896.61 the previous year. The sum of \$1,282,670.67 was paid in dividends on the preferred and common stocks, \$281,666.67 of this amount however being interest on outstanding debentures.

The report shows the capital liabilities of the General Electric Company to be—common stock \$18,276,000, preferred stock \$2,551,200 and debentures \$5,300,000, making a total of \$26,127,200.

It is interesting and gratifying to note that the patent account, which was carried at \$8,000,000 two years ago and which was reduced to \$4,000,000 in the Seventh Annual Report, has again been cut in half and is now carried at \$2,000,000. This is as it should be and is probably a fair estimate of the value of the patents, and franchises owned by the company.

The annual meeting of the stockholders will be held in the office of the company on Tuesday, May 8, at 12 m. The transfer books, which closed April 14, will be re-opened Wednesday, May 9.

New York City and the Garbage Question. The Anti-Barren Island Nuisance Bill has been signed by Governor Roosevelt. This

bill provides that the offensive trades carried on within the limits of Barren Island shall be discontinued inside of a year. This means that New York City will have to seek some other method of disposing of its garbage, and such being the case it might be well for the local authorities to examine carefully into the system extensively made use of in England, with a view to adapting it to the conditions existing in this metropolis. The system we refer to is that employed at Shoreditch, a vestry of London, at Oldham, Ealing, Liverpool and many other places. In these plants all the refuse collected serves as fuel and is made to generate

steam for operating dynamos, the current from which is utilized for lighting and power purposes. Generally speaking a plant consists of a destructor house, which contains a number of cells or small furnaces into which the refuse is dumped. A forced draft is frequently employed to stimulate combustion, the obnoxious gases passing out of the front of each cell and through the boilers before effecting their escape to the atmosphere. As previously stated, the steam produced by this low-grade fuel is in most cases used to generate electricity for lighting or other purposes. A steady feeding of the refuse would naturally generate a steady amount of steam, whereas the demand for power would of course be irregular, a far greater amount being required at night than during the day. To overcome this difficulty two methods are employed. One consists in making use of storage batteries for storing the surplus current while the other is the Halpin storage system, an ingenious arrangement for storing steam, which was described in detail in the issue of Electricity of December 22, 1897.

The garbage destructor plants in Great Britain have apparently given satisfaction and have accomplished that for which they were designed, although according to the best advices they have not been, strictly speaking, money making enterprises. They have been the means however of getting rid of all kinds of garbage and refuse in an unobjectionable and sanitary manner, at the same time furnishing sufficient power to light all the streets from which this low grade fuel is collected.

Many claim that plants of this description could not be made to work satisfactorily in this country owing to the greater amount of moisture present in the garbage, and that consequently they would prove most dismal failures. Admitting that the refuse collected in New York City would prove inferior as fuel to that collected in England, it would simply mean that the profits in the undertaking would be less. According to a recognized authority, however, ordinary ash-bin refuse in this country has a calorific value equal to about one-fifth that of ordinary coal. Assuming a population of 2,500,000 for New York City, the amount of refuse would amount approximately to 5,000,000 tons a year, which according to the authority mentioned would be equivalent to 1,000,000 tons of coal. Of course this is a theoretical figure, and the same amount of power could probably not be derived in practice from 5,000,000 tons of refuse that could be from onefifth that amount of coal, but nevertheless it goes to show that refuse has a certain caloritic value. Such being the case and in view of the fairly good results obtained in England it certainly behooves the authorities of this city, now that a change has to be made, to examine carefully into this method of garbage disposal before deciding on some other method that may ultimately prove as objectionable as the Barren Island scheme.

#### \* \* \*

London Waking Up. An article in the Washington "Star" by its London correspondent, will lead one to believe that the English

metropolis is waking up and emerging from that state of conservatism and lethargy that has enthralled it for many years. After referring to the fact that municipal or public ownership is about to be given a trial on an immense scale in that city the article says:

"In the course of a few weeks the first electric street car to run in London will make the journey from Westminster bridge to Tooting, and from that time electricity will supersede the horse on the line between those classic localities. This is only preliminary to a project on the part of the city of Londonwhich owns this line-to make the same change on all the sixty-eight miles of "tram lines," as they are called, which the city not only owns, but manages, a change which it is estimated will cost in the neighborhood of \$15,000,000. Parliament's consent to this transaction will be asked by the London county council in the course of the present session, and as soon as it is obtained—for there is no doubt that it will be-the work will be undertaken."

But it is not alone its street railways that London proposes to improve, but its telephone service as well Parliament has taken action on that vexed question, which has caused so much discussion in English publications in the past, with the result that the death-knell of the National Telephone Company has probably been sounded. An appropriation of \$10,000,000 has been made for a system to be built and operated by the Post Office. This decision was reached, according to the writer referred to, as follows:

"Wind has played hob with the National Telephone Company's service all through the past year, and only a little while after the passage of that bill through Parliament it asked permission of the London county council to lay its wires underground. It was told that it could if it would consent to work some reforms in its present ragged system and abate its prices to a more reasonable figure. It was when it refused to do this that the council decided to lay an underground system of its own. In the capacity of manager, the city of London will charge \$15 for installation as compared with the \$75 charged by the trust, and make a proportionately lower rate for public call offices."

Now that London is practically assured in the near future of an up-to-date system of screet railways and good telephone service, it might be in place for a Member of Parliament seeking distinction to arise and protest against the alleged inefficient street lights, regarding which the English daily papers have had so much to say of late. Then after the light question has been satisfactorily disposed of, let Parliament appropriate a sum of money for the purchase of a large number of the electrical fog dissipators, which were talked of

a year or two ago, and London will be an ideal electrically-equipped city, and in every way up-to-date.

\* \* \*

An Automobile Stage Service for New York City. A bill recently became a law in this State that will ultimately have much to do with the convenience

of the traveling public of New York City. Some time ago a movement was made to substitute electrically-propelled automobiles for the old lumbering stage coaches which had been plying up and down Fifth avenue for the past decade. This change of affairs was brought about by well known local capitalists, who purchased the old Fifth avenue line. The bill to which the Governor of New York has just attached his signature, is entitled "An act to amend the transportation corporation's law by the addition of a new section in relation to existing routes and extensions." It authorizes any corporation that has operated a stage route continuously for five years last past, in any city of the first class (New York or Buffalo) to extend its routes in any direction without further authority than the approval of the State Railroad Commissioners.

That this law was enacted in the interest of the Fifth Avenue Coach Company, which is, as is well known, controlled by the New York Electric Vehicle Company, is conceded, as the former organization is the only one in this city to which the provisions of the new law could possibly apply.

In the course of time it is said to be the purpose of the gentlemen back of this enterprise-who are also prime movers in the Metropolitan Street Railway Company-so to operate this automobile line that it will supplement the transportation facilities furnished by the street railway company. With this object in view-after perfecting the service on Fifth avenue—double deck automobiles will be run through much frequented highways not supplied with street car lines. The routes to be laid out under authority of the new law will include a number of cross-town streets, such as Sixty-fifth, Seventy-ninth and Ninetysixth. Arrangements will also be made to furnish transportation facilities to persons living on the west side of town at considerable distance from any of the surface or elevated lines, as for instance the residents of West End avenue and Riverside Drive. When this automobile stage service is inaugurated the fare charged will it is expected be ten cents for each passenger, and according to the law the company must pay a license fee to the city equal to the charges now in force for licensing similar stages and omnibuses, and it must also pay to the Comptroller of the city 5 per cent. per annum of its gross receipts.

That an automobile stage service in this city, such as that contemplated, should prove a great convenience to the traveling public there is not the slightest doubt, and it is therefore to be hoped the near future will find it a reality.

A REPORT has been received at the British Embassy at Washington from the home Government in which it is stated that the following ships will be under construction for the British Navy in the course of this year: Seventeen battleships, 20 armored cruisers, 1 first-class protected cruiser, 2 second-class protected cruisers, 1 third-class cruiser, 8 sloops, 2 light draft gun boats, 4 torpedo boats, 21 torpedo

boat destroyers. Regarding wireless telegraphy the report says: "The Marconi system of wireless telegraphy was tried in the naval manœuvres of 1899, and proved very successful so long as only one ship was signaling. Signals were taken in successfully at a distance of sixty miles. Negotiations have been carried on between the British Government and the Marconi Company, but the question of terms has not yet been settled. In the meanwhile the Admiralty are endeavoring to procure for further and more extended trials some more installations of wireless telegraphy, both from the Marconi Company and from other sources."

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

The electrical contractors of the United States will hold a convention in this city about September 1. This selection was made because most of the supply houses of the association are located here.

A DISPATCH from abroad states that a Franco-Belgian syndicate proposes to establish an electric tram line between Brussels and Paris, the run to be made in two hours.

Almost all the towns in Siberia are having are lights for street use and incandescent lights for houses, and it is claimed the larger proportion of the people in Siberia have never seen gas, which they regard as an illuminant of a past age.

THE new trolley road between Hazleton and Wilkes-Barre, Pa., will have some novel features. A steam engine to haul freight between the cities is one departure. Another will be a through electric express car from Hazleton to the county seat that will have a maximum speed of a mile a minute, and make the trip in less than an hour.

Consul Thackara at Havre reports to the State Department at Washington, that a new submarine telegraphic cable, 81.3 knots in length, has been laid between Havre and Cuckmen, near Beachy Head, England, by the steamship Britannia for the Anglo-American Telgraph Company. The land connections in England and France will be completed in a short time. When the new cable is connected with the London wire, use of the Brest cable will be discontinued.

At the seventh annual exhibition of the New York Academy of Sciences, held in the American Museum of Natural History, Columbia University was represented by a series of remarkable astronomical photographs. There was an interesting collection of microscopes, Electrical progress was shown by many models. In the realm of photography there were pictures of moving trains taken with an exposure of 1-500 part of a second.

An automobile, which is to displace mules on the towpaths, was tested last week on the banks of the Delaware and Raritan Canal near Trenton in the presence of several officials of the canal company. The automobile towed a hundred-ton boat at a rate of three miles an hour for a stretch of several miles.

THE electric ambulance for St. Vincent's Hospital, New York City, is now completed and is a most handsome vehicle. It is steered by the front wheels, with two two-horse-power motors driving it. Solid rubber tires are used and a rawhide gearing to lessen the noise of the

machinery. The interior is lighted by a tencandle power electric light.

THE Northern Pacific Company has installed its new electric pump about a mile east of Mandan, N. D., power to which is conveyed on wires. The pump is run by a 20-horse-power electric motor, and it works smoothly. Locomotive engineers who are using the water from the new well state that it is better and clearer than the Missouri River water taken from the Bismarck standpipe. The Bismarck water is pumped from the river and then allowed to settle in the large receivers of the Bismarck Water Company. The water now being used by the railroad from its new well is Missouri River water, filtered through about half a mile of sand that separates the well from the river.

THE annual meeting of the National Academy of Sciences at Washington, D. C., was recently brought to a close with the announcement of the award of the Barnard medal to Wilhelm Conrad Roentgen, the discoverer of the X-rays. The medal is presented only once in five years, and is given to the person making the most important scientific discovery during that period. The award was unanimously approved by the members. Three papers were read, two by Mr. Reginald Fessenden, who considered technical points relating to electric motors, and spoke on the physical properties of pure metals, and the third by Mr. F. W. Putnam, who gave an account of human bones found near Trenton, N. J., in glacial deposits. The next stated meeting of the Academy will be held at Providence, R. I., December 13, 1901.

THE generating plant of the Colorado Electric Power Company is situated in Canon City, Col., with an abundant water supply, and no difficulty to contend with in regard to procuring coal, located as it is near large coal fields, and exempt from the trials of snow-bound roads which a mountainous country is afflicted with. In the Cripple Creek district about 100 mines get their power from the electric wires, which the company has strung into camp, and six mills also run by this means. They are saved all the petty annoyances that come to those using steam, such as the freezing of the pipes. as well as the dependency on water and coal; and the fact that this plant is located outside of the mountains gives it an advantage over the local electric works, as the latter is as dependent for water and fuel as are the mines.

CONSUL BORDEWICH sends from Christiania Norway, the programme of the permanent machinery exhibition which has been opened in that city. Manufacturers, agents and other interested parties are invited to exhibit. The metal, wood-working, spinning and weaving industries will be represented, as well as works in paper, leather, rubber, clothing, etc.; also engines. The programme sets forth that machinery, tools, etc., can be exhibited at a low rent in centrally situated rooms. Appliances can be shown in operation without extra expense for driving power. New and patented machinery and appliances may be exhibited and advertised cheaply and effectively. Catalogues of the exhibition will be distributed without extra expense to the exhibitors. Mr. Bordewich advises that new inventions, should be patented in that country before they are shown. Application for patent in Norway should be made within six months after patent is granted in the United States.

# General Electric's Eighth Annual Report.

## Statements of the President, First, Second and Third Vice-Presidents.

#### **RESULTS OF THE PAST YEAR'S BUSINESS.**

The following is the full text of the General Electric Company's Eighth Annual Reportfor the year ending January 31, 1900:

#### PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 21, 1900. To the Stockholders of the General Electric Company:

During the past year there has been a rapid growth of confidence in the securities issued by Electric Railway, Illuminating and Power Companies, and a greatly increased investment demand therefor.

The result of this employment of new capital in such enterprises has been to stimulate the production of that class of electrical apparatus to the manufacture of which the factories of the General Electric Company have been largely devoted.

Apart from the activity in such fields, the rapid adoption of electricity for operating all kinds of machinery, its application in naval and marine service, and to chemical uses, and the introduction of electric street vehicles, have resulted in the design and manufacture of many new electrical appliances by your company. Meanwhile the demand for those motors, lamps and general supplies, which have long been standard with your company, has been well maintained.

There are appended hereto reports of the First, Second and Third Vice-Presidents, covering matters of interest in the several departments under their charge.

Your careful attention is invited to the complete and detailed information given there-

Reduction in patent account.....

Net addition to surplus account ......\$2,196,459.58

While the results of the year's business have in general been satisfactory, the wide fluctuations in the values of raw material have created much disturbance and increased the difficulties in estimating costs and in fixing prices.

Because of the complexity of its business and the great number of devices manufactured by your company, aggregating many thousand separate items, every revision of values adds very heavily to the burdens of those in charge of the manufacturing department.

The arduous and admirable service rendered by the engineering and commercial departments cannot be too highly commended.

By order of the Board. C. A. Coffin, President.

#### FIRST VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 10, 1900. C. A. Coffin, Esq., President General Electric Company.

Sir: I submit herewith a brief report of the

operations of the sales department for the fiscal year ending January 31, 1900:

#### SALES.

It should be noted that the "profit on sales" is thus figured independently of various items on the profit and loss statement, the aggregate of which is a credit balance of \$1,673,270.02, making the total net profits \$5,479,130.20.

#### ORDERS RECEIVED.

The increase over last year in orders received is 51 per cent. The increase in each class is: 

Over 142,000 separate supply orders were received, of which only 623 were in excess of \$1,000, the average of all being \$59.00. Over 10,000,000 incandescent lamps were ordered during the year. There were 11,807 customers on our books at the close of the fiscal year.

About 87 per cent. of the year's orders were on our standard terms of payment-cash within sixty days.

#### Orders Received for the Past Five Years.

riscal	vear	ending	Jan.	31.	1896	\$13,235,016
••	• • •		**	""	1897	11,170,319
••	**	**	44	"	1898	14,382,342
		• •			1999	
**	**	**	••	"	1900	26,323,626

#### LOCAL OFFICE INVENTORIES.

Local office inventories have been increased \$180,031 during the year and are maintained in good saleable condition. The recent inventory shows:

ActiveObsolete	18.853	96.6 2.8 0.6	p <b>er</b>	cent.
	965H 054	100 5	OF (	ont

#### GENERAL REMARKS.

The past year shows a very large increase in volume of business over any previous year, due in part to much higher prices caused by the very considerable increase in cost of raw ma-The policy of consolidating small lighting and railway companies and substituting one large generating plant for two or more small ones has been continued and has caused a marked change in the character of electrical apparatus now being purchased. Large multiphase generators with alternating current distribution and rotary converter sub-stations are almost exclusively used in such consolidated stations when the transmission covers considerable distances.

The great increase in our orders (51 per cent.) has involved an increase of 141 per cent. in the expenses of the sales department, and has necessitated more and harder work on the part of all department and local office managers and sales agents. It would be difficult to find a more loyal, hard-working and faithful corps of employes than is to be found in this department, and I desire to express my great appreciation of the energy, zeal and loyalty shown by them during the past year.

Mr. S. Dana Greene, general sales manager and chairman of the local companies' committee, met with a tragic death at Schenectady in January last. His death is not only a serious loss to the company, but also a personal bereavement to all of his friends and associates in the company. Respectfully submitted,

EUGENE GRIFFIN, First Vice-President.

## THIRD VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 10,1900. C. A. Coffin, Esq., President General Electric Company.

SIR: I submit the following report on manu-

facturing and engineering for the fiscal year ending January 31, 1900:

#### MANUFACTURING.

The usual practice of billing the output of the works to the General Office at estimated factory cost has been continued. This cost includes all material and labor plus a percentage to cover all items of general manufacturing expense and engineering, and an ample allowance for depreciation. The percentages thus added to material and labor have been demonstrated by the annual inventory to be sufficient, as will be seen by reference to the financial statistics given in the report of the second vice-president.

The great increase in our orders has strained our factory facilities to the utmost, notwithstanding the liberal additions heretofore made to our machinery and buildings. We were fortunate in having completed and equipped, at the Schenectady Works, the large machine shop mentioned in my last report. This shop is now crowded with work.

There have been erected at the Schenectady Works during the past year a forge shop of 16,000 sq. ft. and a storage building of 12,000 sq. ft.

Additions aggregating about 55,000 sq. ft. have also been made to the drafting room, pattern shop, punch press shop and brass foundry, all substantial buildings of brick and iron construction.

The large iron foundry which was completed about a year ago has been found inadequate, and an extension of about 40,000 sq. ft. is now under way.

An extension to building No. 23, of about 40,000 sq. ft., has been started. This is needed to take care of the increased demand for switchboards, controllers, and similar apparatus.

At the Lynn Works we have completed a further extension to our steel foundry, of about 18,000 sq. ft. Also the new building for the manufacture of meters and instruments, mentioned in my last report, is now so crowded that a further increase of 7,000 sq. ft. has been found necessary and is now under way.

We have purchased 14 acres of land at the River Works, at Lynn, in order to give room for future extensions.

At the Harrison Works the large fire-proof building, mentioned in my last report, has been completed and is in full operation, and further extensions are under consideration in order to give the needed increase in our output.

The total area of the factory buildings aggregates approximately 2,000,000 sq. ft., which will be increased 100,000 sq. ft. when the buildings now under way are completed.

The number of employes in all the works is about 12,000.

We expended during the past year for new buildings, extensions and machinery equipment, a total of about \$900,000,exclusive of the expenditures for patterns, special tools, furniture, etc.

#### ENGINEERING.

The engineering work during the past year has been chiefly in the direction of improved efficiency and overload capacity, and in the design of larger sizes of apparatus of existing types.

A number of the great electric generators (5,000 hp.) for the new station of the Metropolitan Traction Company, of New York, have been in operation for several months and are regularly supplying current for the operation of electric street cars and for lighting in the city of New York. We are now manufacturing

eight machines of the same general character, which will be installed in the new station of the New York Gas, Electric Light, Heat & Power Company, of New York City, and used for the generation of current for lighting and power purposes, aside from electric street railways.

There has been a marked increase in the size of electric generators, of the direct current type, suitable for lighting and power for moderate distances.

Long distance transmission plants have increased in number and importance during the past year.

The revolving field type of alternating generator with stationary armature winding, permitting the direct generation of electricity at high potentials, a form exclusively introduced by us, has met with great success and is now generally employed to the exclusion of older and less perfect types. Our orders during the year for this type of generator alone amounted to over 200,000 horse-power.

We have sold during the year about 150,000 hp. of large transformers of the air blast type, a design introduced and supplied solely by us.

The United States Navy has generally adopted electricity in place of steam or hydraulic machinery for pumping, hoisting, ventilating, and operation of turrets, as well as for lighting and small power work.

There has been a continued increase in the number of electric motors used for driving machine tools in factories, and in such special applications as the operation of printing presses, ventilating, pumping, mining, cotton mill and paper mill machinery.

We have filled many important orders, covering all classes of our apparatus, for use in foreign countries.

There has been a marked increase in the demand for electrical apparatus of special design, which is more expensive than standard, takes longer to produce and diminishes the effective output of our works. To meet this demand we are systematically increasing our line of standard sizes, which can be produced of superior quality in shorter time and sold at a lower price.

There has been a continued improvement in the efficiency and quality of our numerous small articles of manufacture, such as are lamps, transformers, and particularly switchboards.

We have continued to protect our new and important engineering designs, as far as possible, by applications for letters patent.

The work of our factory managers and engineers is worthy of the highest commendation.

Respectfully submitted,

E. W. RICE, JR., Third Vice-President.

#### SECOND VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 10, 1900. C. A. Coffin, Esq., President, General Electric Company

Sin: The balance sheet and statement of profit and loss, herewith transmitted—with explanation of every item on the balance sheet—include the assets and liabilities and profit and loss accounts of the Edison General Electric, Edison Electric Light, and Thomson-Houston Electric Companies (which, for convenience of book-keeping, are consolidated with those of the General Electric Company) at January 31, 1900; and when "the company" is spoken of, all the above mentioned corporations are included.

#### ASSETS.

#### PATENTS, FRANCHISES AND GOOD-WILL.

Leaving all the patents. franchises, good-will, etc., of the company standing on the books at the date of the report, as per balance sheet, at \$2,000,000.00 FACTORY PLANTS.

This account represents the real estate (lands and buildings); machinery (steam plants, tools, appliances, etc.); patterns (including drawings, etc.); sundries (fittings and other small property accounts) of the manufacturing plants at Schenectady, N. Y., Lynn, Mass., and Harrison, N. J.

All are free from mortgage or other lien.

The lands of all three plants now amount to about 174 acres and the total factory floor space of all their buildings is approximately 2,000,000 square feet.

It is worthy of note that the entire book value (\$1,858,044.65) of all lands and buildings is less than one dollar per square foot of the total manufacturing floor space in those buildings.

The company's constantly growing business has necessitated continuous expenditures to increase its manufacturing capacity by acquiring more land, enlarging old and erecting new buildings and for general improvements and new machinery. The cost of these additions has been charged against the general earnings of the company, as have also all expenditures for the maintenance and repair of buildings and machinery, plus an allowance to provide for depreciation.

Harrison plant (lamp factory). 200,000.80

A summary of the changes in this account since the last annual report is as follows:

В	ook value Jan. 31, 1899.	additions	Written off at the end or the year.	Book value Jan. 31, 1900.
Real estate.				\$1 858 044 65
Machinery.	1,542,955 8	5 630,633.00	651,658.00	1,541,955 35
Patterns	1.0	0 161,157.42	161,157.42	1.00
Sundries*		0 198 310 86	128 310 86	1.00

Totals.....\$3,400,002.00 \$1,330,428.40 \$1,330,428.40 \$3,100,002.00

\*Include office furniture and fixtures of the factories, houses and trucks, shop fixtures, benches, steam fitting above ground for heating system, sprinkler system for fire protection, electric wiring of buildings, etc.

## REAL ESTATE.

#### (Other Than Factory Plants.)

This account represents the investment in the Edison Building. 44 Broad street, New York City; also a four story brick building covering five lots on the corner of Avenue B and 17th street, New York City; and sundry parcels of land in various piaces, mostly improved and rented, which have been acquired at various times, chiefly in payment of debts.

All are free from mortgages and will be sold when opportunities offer.

This account has decreased \$51,391.28 during the year, chiefly by selling real estate in Atlanta, Ga., and Rock Island, Ill.

#### STOCKS AND BONDS.

Pursuant to the established policy of selling securities, which there is no special reason for

holding permanently, various stocks and bonds have been sold for cash since the last annual report.

Their total par value was \$2,755,518 05.

They were sold for	\$2,678,409.03
They had been carried on the books at	1,839,551.30
Profit	\$838,857.78

The money realized from the above sale of assets was expended upon extensions to the factory plants, in purchasing \$400,000 of the company's own debentures and to protect and improve existing investments by acquiring (at a cost of \$1,274,428) miscellaneous stocks and bonds, of the aggregate par value of \$1,693,400.

In the book valuations of stocks and bonds remaining on hand since January 31, 1897, no material changes have been made since they were appraised three years ago. The book value of those not readily salable was then fixed, after careful examination of their worth at that time. Those having a market value are still carried under the price of then reported sales.

Those more recently acquired are carried at cost.

Schedules A and B annexed hereto contain lists of the most important of the company's holdings of stocks and bonds. Their total par value is \$11,466,309. They are carried at an aggregate book value of..........\$5,754,748.03

In addition, the company owns various other securities. As their present value is doubtful and their future value speculative, they are not set forth in the schedules. They are carried on the books as follows:

Stocks and bonds of local lighting and street railway companies wholly owned (par value \$151,500).....

Sundry holdings (par value \$418,-882).....

41,852.00

335,547.01

121.00

Miscellaneous securities of many underlying manufacturing, selling and patent owning corporations, and also of street railway and lighting companies, carried at one dollar for each lot, in all

Total book value of all stocks and bonds, as per balance

#### NOTES AND ACCOUNTS RECEIVABLE.

This accout represents the total debts now due the company.

They appear in the annexed balance sheet at and estimated realizable value—i.e., from their face, \$7,314,930.12 (which is less than the billed amount of goods shipped during the last ninety days of the year), has been deducted an allowance of \$337,119.82 for possible losses (see allowances for possible losses).

I believe this allowance to be a fair one and ample under existing general conditions of business in the country.

## Sales and Collections During the Year.

The net amount of sales billed to customers during the year exceeded twenty-two million dollars—those of the last three months aggregating nearly seven million five hundred thousand dollars.

Of some 11,800 regular customers on the accounts receivable ledgers, there were debit balances against 4,600 at the close of the fiscal year.

	Notes receivable.	Accounts receivable.	Total face values,
Total face value Jan. 31, 1899 Of which there have	\$1,493,630.99	\$4,313,330.76	\$5,809,961.75
been sett!ed during the past year		4,031,227.77	5,180,503.65

" Dollar	" Notes an	d Accounts.	

In addition to the above there are old notes and accounts receivable of one hundred and ninety-two debtors, aggregating \$1,272,665.95, which have been written off to profit and loss except the nominal book value of \$1 for each debtor. They stand on the books at a total of \$192 and are being liquidated gradually. The total amount realized from this class of notes and accounts by settlements made during the past year was \$7,457.46.

Allowances	for	Possible	Losses.

	Notes	Accounts.

Total book value as			

per balance sheet ..... \$905,875.37 \$6,071,934.93 \$6,978,002.90 In the settlements of old debts, on which

there were allowances for losses, as above shown, there were realized \$185,297.72 over last year's book valuations, less \$39,968.82 loss in settling some debts below their appraised value. Net gain above appraised value \$145,-328.90.

### WORK IN PROGRESS.

This account does not include outlays for anything in process of manufacture at the factories, but represents expenditures for labor, material, etc., at cost, on 560 incompleted installations of finished apparatus in progress at various places.......\$1,024,552.60

Less partial payments thereon, received under the terms of

the contracts as work progressed 150,424.24

Balance as per balance sheet... \$874,128.36

None of the estimated profit to be derived from these installations is included in the earnings of the year.

#### INVENTORIES.

These accounts represent actual inventories—counted and valued item by item—of raw materials and goods manufactured and in process of manufacture at the factories; of shipments in transit to storerooms of local offices; of manufactured goods in storerooms of local offices; of materials in local repair shops; and also of all goods on consignment.

Raw materials have been valued at the lowest price paid by the company during the last three months of the fiscal year. The market

price prevailing on January 31, 1900, was used where it was lower than the lowest price paid by the company during the said three months.

Active-selling finished and partly finished apparatus and supplies were valued at estimated factory cost; inactive or slow-selling apparatus and supplies at about 50 per cent. of estimated factory cost; and obsolete apparatus and supplies at scrap value.

#### Factories.

On the above basis, the inventories of the factories exceeded their book value. Following the practice of previous years, the whole of such excess has not been taken as a profit, but a portion has been retained as a reserve against possible increased cost of manufacturing, in case of further advance in prices of raw material.

The very large increase over last year's total factory inventories is due to accumulation of work—owing to the unfilled orders in process at January 31, 1900, being \$3,000,000 more than those at January 31, 1899, as well as to the increased value of the raw materials included in these inventories.

#### General and Local Offices.

During any fiscal year, goods are taken in and out of local office inventories at the estimated factory cost then prevailing. Consequently, at the close of that fiscal year, there must always be considerable change in book values of finished apparatus and supplies carried over—to adjust their inventory prices to latest estimated factory costs and to provide for losses due to returned articles, cost of repairs, breakages, boxing, reclassifying and writing down the book value of goods no longer quick-selling, etc, etc.

Owing to present increased estimated factory cost, the inventories of apparatus and supplies in all local offices showed an increase over book value of \$33,286.04 which amount has not been treated as a profit, but is held as a reserve.

#### Office Furniture and Fixtures.

The total inventoried value of all office furniture and fixtures, machinery, tools, instruments, etc., in the general and local offices, and in local repair shops was \$78,921.99. All these items have been reduced to a total book value of one dollar, and the difference charged to this year's profit and loss.

#### Consignments.

Finished apparatus for novel uses has been delivered to various concerns subject to purchase if its operation is successful. The greater part of consignment account represents such contingent sales, and the remainder represents apparatus on exhibition or loaned to regular customers for temporary use by them.

#### LIABILITIES.

The company has no note payable, nor is there under discount any paper bearing the company's endorsement or guaranty.

It has not borrowed any money, nor has the company's credit been used during the year either by issuing notes, endorsing customers' paper for discount or lending its name in any way; but by adhering to its established policy of maintaining sales on a basis of cash or short credit to desirable customers, all purchases have been paid for in cash.

#### DEBENTURES.

During the year the company has purchased

and canceled \$400,000 of its own 5 per cent gold coupon debentures, due June 1, 1922, at an. average cost of 117.68 per cent.

#### ACCOUNTS PAYABLE.

This account includes all unpaid audited indebtedness

At the close of business on January 31, 1900, the unpaid vouchers on hand-none of which was then due under the terms of purchaseamounted to ..... \$317,020.03

Between January 31 and February 26, 1900, the date of closing the general books, additional liabilities belonging to the past year

were audited, amounting to ..... 686,344,02

Total as per balance sheet....\$1,003,364.05 The amount of unpaid vouchers carried over in this way monthly-by keeping the books, other than the cash book, open a sufficient time to include each month's obligations in that particular month-has averaged during the year about \$860,000.

#### ACCRUED INTEREST ON DEBENTURES.

This account, as its name implies, is the full amount of 5 per cent, interest accrued to January 31, 1900, on the company's \$5,300,000 outstanding debentures.

#### UNCLAIMED DIVIDENDS.

This account represents the full amount unpaid on all dividends declared and payable to January 31, 1900, inclusive—the addresses of a few stockholders being unknown.

Respectfully submitted,

J. P. ORD. Second Vice-President

books and accounts of the General Electric Company, the Edison General Electric Company, the Edison Electric Light Company, and the Thomson-Houston Electric Company, for the year ending January 31, 1900, and hereby certify that the consolidated income accounts published in the foregoing annual report of the General Electric Company, as of January 31, 1900, correctly state the results of the business for the period, and that the balance carried down in profit and loss account includes the closing of all income and expense accounts: also accrued interest on debentures and all accrued dividends on preferred stock and all dividends on common stock to January 31, 1900.

We further certify that the consolidated condensed balance sheet, published herewith, correctly states the assets and liabilities of the company at January 31, 1900, as shown by the books.

In the course of this examination we audited the pay rolls, checked all vouchers for disbursements, and found that such disbursements were correctly carried into the general books of account: also traced the sales from the shipping department through the sales journals into the general ledger.

We verified the cash balances by comparison with pass books or statements of the various banks of deposit and by actual count of cash in the treasurer's office. The only cash items not

#### REPORT OF THE ACCOUNTANTS.

NEW YORK, April 16, 1900.

To the Board of Directors of the General Electric Company.

We have made a critical examination of the

verified were the various small balances carried in the distant branch offices.

We verified the amounts of stocks, bonds and bills receivable owned by the company, either by actual count of the securities in the

office of the treasurer or by receipts and certificates of the trust companies and other custodians of the same.

We examined, item by item, into the book values of the stocks and bonds owned, and we are satisfied that in the aggregate the actual value of the securities is fully equal to the amount at which they are carried on the books.

The large profits realized on the securities sold during each one of the past several years demonstrates that they were carried at a conservative valuation. All of the stocks and bonds owned by the company, exclusive of those carried at one dollar for each lot, were inventoried at the end of the last two fiscal years as follows:

 January 31, 1899.

 Stocks at....
 42,95%
 44.53%

 Bonds at....
 63.79%
 70.45%

We observed the methods employed by those familiar with the circumstances to determine the estimated amount charged off as a reserve against bad debts and other possible losses on notes and accounts receivable, and are satisfied that such estimates were carefully and fairly made. These methods are fully justified by the outcome of the estimates of previous years made on the same basis, the result being a profit over the reservation on the notes and accounts collected. The collections are closely made and the results show the credits are well supervised.

The technical nature of the business of the company, and the wide range, number and variety of the articles manufactured, render it impracticable for any persons not mechanically expert in the various lines and familiar with the goods, to correctly identify and inventory them; therefore, the inventories at January 31, 1900, were necessarily taken and priced by the company's own experts. We, however, noted the manner in which the inventories were compiled, item by item, and verified the computations. Our knowledge of the instructions given and the methods and precautions followed to insure correctness leads us to believe that said inventories were carefully and conservatively taken and that the total value of the goods is not overstated in the amount carried over in the balance sheet.

We have not attempted to appraise the manufacturing plants, but in our opinion, which is based upon our observation of the methods of treating improvements to the plants and the amounts charged off for depreciation, the policy of the management regarding charges to plant is unusually conservative and commendable.

As to the value of the patents and franchises we do not feel competent to express an opinion. The patents, franchise and good will account, now reduced to \$2,000,000, contains all items properly chargeable thereto.

We observed the instructions given and the precautions taken to enter all accounts payable on the books at the time of closing and are satisfied that all known existing current liabilities of the company are included in the balance sheet.

The policy of the company as reflected in its accounts is to charge off all ascertained shrinkages or losses immediately, and at the end of each year to make liberal allowance for possible losses; but no profits are written until sales are made.

We have read the report of the second vicepresident and find that it correctly explains each item of the balance sheet and sets forth in exact terms the general accounting methods of the company.

PATTERSON, CORWIN & PATTERSON, Certified Public Accountants.

#### THE GIME SPEED REGULATOR.

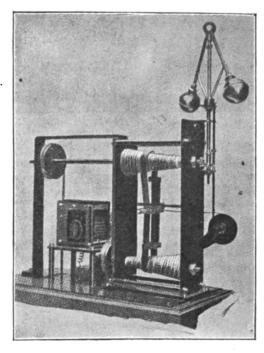

Translated for Electricity from "La Vie Scientifique,"

Among the thousand and one problems which engineers have attempted to solve, there is little doubt that the most important is a speed regulator combination that is capable of meeting all industrial requirements.

It is easy to understand that the question is truly of considerable importance.

When the motive power of a factory is furnished by a steam engine, naturally the engine selected is of sufficient power to meet all the requirements of running all the machinery or apparatus simultaneously, but in common practice it is seldom that the same power is constantly required, for at any time in a work shop some machines may be stopped and again started with the inevitable result that the consumption of energy by the machine tools furnished in quantity by the main power generator, varies incessantly, giving a general tendency toward an acceleration of speed or the opposite in variable proportions, according to the increase or decrease of work.

In all industrial operations the same difficulty is experienced, so much so that for a

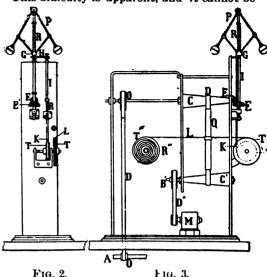

THE GIME SPEED REGULATOR.

long time special adaptations have been made to remedy the defect, such for example as the use of revolving weights of considerable dimensions, as exemplified in the Watt ball governor, commonly employed to open or close a steam supply valve, according to the decrease or increase of engine speed.

However simple and efficacious these regulator systems may be in themselves they are not suitable to all conditions. Sufficient in results to compensate for most of the extreme variations encountered in factories, they are not pliable and delicate enough to take care of the smaller and minimum speed regulations, or if in every day factory practice we are satisfied with a coarse regulation, there are other conditions where much more perfect speed regulation is essential. This is the case among others at least of electric dynamo installation on trains, where electric illumination is used for lighting cars, for here in fact we find present two conflicting conditions, where the proper burning of the lamps demand a constant and regular current, and where the generating dynamos are dependent on the speed of the train which supplies power, and which is constantly varying with the speed of the locomotive.

This difficulty is apparent, and it cannot be

remedied except with a speed regulator suitably constructed. This was so well known that in the trials recently made between Paris and Vintimille, under the auspices of the Paris-Lyons-Mediterranean Railroad Company, to eliminate the fatal variations of the electric lights due to change of speed, means were suggested to prevent a rise of over 25 amperes, which is obtained when the train attains a speed of 30 miles.

The system of regulation employed, although very good, was not sufficiently serviceable to meet all requirements. There was lacking an apparatus to insure perfect operation of the lamps, not only when the train was under full headway, but also when the speed was increased or diminished, and even when at a full stop.

As complicated as this problem appears, it has been solved by a speed regulator of novel construction invented by the able electrician, M. Gimé, who has also devised an ingenious means of assuring the automatic closing of car doors when a train is in motion.

The regulator is very simple in construction, and essentially consists of a varying element, interposed between the prime mover and the machine to be controlled, and of a Watt ball governor acting on a power transmitter, through an intermediate mechanical arrangement in such a manner as to diminish the speed when the driving axle speed increases, and vice versa,

The mechanism consists of two differential cone pulleys, C' and C, connected by a belt D. A ball governor P furnished with an opposing spring R, connected to the shaft B. The latter receives its motion from the pulley O, which is connected to the main shaft A, by means of the belt D', passing around pulley O. A cone gear E engages a smaller gear E', attached to the shaft of the ball governor P, Fig. 3.

The speed regulation is accomplished as follows: The shaft B' of cone pulley C' transmits motion directly to the generator, by means of the belt D"

The collar G of the governor, is furnished with an arm H, carrying a vertical rod I, which terminates in a flexible band K, which winds around a drum T. A spring R' presses against the rod I, to maintain the tension of the band K, on the drum T, which is connected to a second drum T', by a flexible band L. T' is

attached to the same shaft as the drum T, and on the other side is attached a small pulley T", acted on by a spring R". Finally on the flexible band L is attached a belt shifter Q, surrounding the belt D, Figs. 2 and 3.

We see from the above construction, that when the motive power quickens its speed above the normal the governor balls P rotate more rapidly and lift the collar G, and consequently the rod I upward, and the band L moves from the left to the right, carrying the belt shifter Q with it, and consequently the belt D.

It follows from the construction of the two differential pulleys C and C', that this displacement results in a diminution of speed, and that it becomes possible to maintain a constant speed for pulley C', and consequently for the driven mechanism.

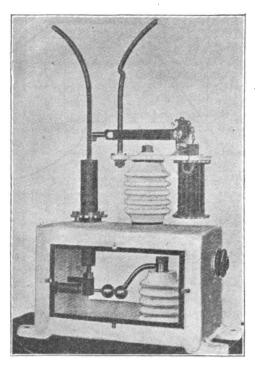

The opposite occurs when the motive power decreases its speed. In this case the governor balls fall, and assisted by the spring connected to the barrel R", the belt shifter Q is displaced from the right to the left, which results in an increase of speed for the receiving machine.

A more happy combination for the purpose could not be secured than that realized by M. Gimé in this regulator, and with little doubt it will rapidly receive the attention of specialists through the better results secured, and especially in its applications to electrical installations and to automobiles where it should prove profitable.

#### A HIGH-VOLTAGE SAFETY DEVICE.\*

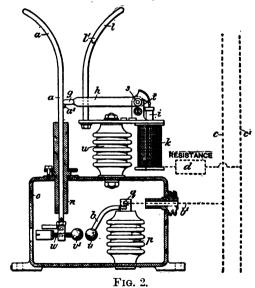

The protection of electrical circuits from abnormally high voltage, arising from accidental or other causes, probably had its earliest illustration in the lightning guard, the necessity for which arose when aerial wires were first used in connection with telegraphy. Since the introduction of the telephone, the electric light, and circuits for the transmission of power and for electric traction, similar protecting devices for guarding against the effects of lightning have from time to time been rendered necessary where aerial wires have been used. But where the circuits carry a large amount of power, the ordinary spark-gap apparatus is insufficient to guard the circuit from breakdown, for the flash across the gap breaks a path for the electrical power of the circuit, and a continuous flash across the gap takes place, the line being very speedily broken down from this cause. In order to obviate this, various devices have been introduced, such as sparkgaps between two metallic horns so constructed that the convection currents caused by the spark raise the spark upwards to a point where the gap is so wide that the voltage is no longer able to maintain the spark. This form of selfextinguishing lightning protector has been extensively used on electric power circuits with aerial lines. The abolition of aerial conductors on systems of electric supply mains in this country has not, however, removed from these mains the dangers which arise from excessive high voltage momentarily occurring. It is true that lightning does not affect these mains, but an equivalent effect is produced by the inductance and capacity of the cables and the apparatus connected to them whenever any portion of the circuit is connected or removed from the rest of the circuit. Thus, for example, in a system of high-voltage alternate-current distribution mains the connection or removal of a section of the circuit at the switchboard is liable to cause momentarily as much as a 50 per cent. or even greater rise in the pressure on the mains. The danger of even a temporary rise of this magnitude is considerable, owing to the liability of breaking down of transformers and other plant placed across the mains.

The problem of providing a reliable and

 $Fig. \ 1.$  The "Partridge" High-Voltage Safety Device.

quick-acting device to guard against this evil has occupied for some time the attention of Mr. G. W. Partridge, chief engineer to the London Electric Supply Corporation, with the result that a very ingenious and perfect form of apparatus has been evolved by him. The final form of this instrument is shown in Fig. 1. Its action is best explained by reference to Fig. 2, which gives a diagram of the internal

connections of the instrument and shows its connections to the cables. In this figure c is the inner and  $c^1$  the outer conductor of a concentric cable to be protected. Connection is made from the inner conductor c through a gland in the box to an insulated knob, v, which makes, with the knob  $v^1$ , an adjustable spark gap. The path of the spark after leaping the gap is from  $v^1$  to a, one of a pair of metallic

horns, the width between which increases with increasing height. The other horn is shown at 1. The gap between these two horns is normally short-circuited by a metallic lever. A. which is pivoted at s, the other arm of the lever carrying an iron core, i, which is suspended at the mouth of a solenoid, k. The circuit of the spark is therefore first across the gap, then by the horn a and along the lever h, whence it passes through the coils of the solenoid k and finally through a resistance, d, to the outer onductor  $c^1$ . It will thus be seen that the passage of any considerable discharge across the gap will energize the solenoid and attract the iron core, thus lifting the tip g of the lever until this strikes the outer horn lat the point  $l^1$ . The torrent or flash which will be produced between the horn a and the tip g will at this point,  $l^1$ , be transferred to the two horns at a point where the gap is sufficiently wide to allow the convection currents to lift the flash bodily upwards until it is extinguished by the widening between the upper part of the horns. In operation this piece of apparatus is remarkably prompt. We saw portions of the circuit rapidly connected and disconnected from the mains; and whenever the pressure rose more than 25 per cent. above the 10,000 volts normal pressure the apparatus promptly set itself in action, and in a small fraction of a second the earth discharge was effectively extinguished. It might be mentioned that the percentage rise above the normal pressure required to put the apparatus in action is adjustable, the spark-gap between the knobs v and v1 being adjusted by means of a set screw. It is further to be noticed that in this form of apparatus the whole of the exposed parts are normally dead, being connected to the outer concentric cable; all the live parts are contained within the box and also being carefully insulated.

#### A Vacuum Electroscope

It is a matter of considerable interest, from a theoretical point of view, to ascertain the nature of electrostatic actions in an absolute vacuum. With the improved apparatus now available, a much more perfect vacuum can be produced than was the case some years ago. Pflaum\* has constructed an electroscope in which the leaves were of aluminum foil and were enclosed in a pear-shaped glass bulb exhausted to a very high vacuum. The vacuum was by no means perfect, but was sufficiently good to show that a vacuum is probably a perfect insulator, and all electrostatic effects take place, though in an intensified degree. Two platinum wires were fused into the lower part of the bulb, between the ends of which was a spark gap of 0.4 mm. When a discharge was sent between these two wires from a 40 mm. induction coil, the leaves of the electroscope were violently affected.

If an electrified body is brought near the knob of the electroscope, the leaves diverge as in the ordinary electroscope, but when the body is removed the leaves come together, and then permanently diverge. The final effect is considered to be due to negative electricity discharged from the leaves on to the inner wall from the tube. If electric oscillations are produced in the neighborhood of the electroscope the leaves are thrown into violent vibration. If the oscillations are produced by the induction coil or Tesla coil the vibrations gradually pass into a permanent divergence. In the first case the permanent charge is of

<sup>\*&</sup>quot;Ann. der Physik," etc., page 290, 1900.

<sup>\*</sup>From the "Electrician," London

the same sign as the first discharge of the coil; in the second case, the sign of the charge is negative when the Tesla coil is near the electroscope, and positive when the coil is distant.—The "Engineers and Iron Trades Advertiser," Glasgow.

#### THE PARIS EXPOSITION.

(Special Correspondence of ELECTRICITY.)

#### The Palace of Electricity.

During the inauguration period, and before going into a detailed study of the many applications of electricity contained in the electrical department, it is better to devote the first article to a description of the magnificent palace which M. Henard, the prominent architect, has lately completed, to contain the powerful machinery, together with the numerous appliances sent by the electrical trade from all parts of the world, mentioned in an itemized list in one of our last reports.

The Palace of Electricity has lately undergone many changes, and is not yet completely finished and properly fitted. It occupies, with its annexes, the whole area of the Champ de Mars, its dimensions being 420 meters long by 80 meters wide. This immense structure towers above all the neighboring buildings, and a majestic entrance to it is found in the adjoining Chateau d'Eau. The Palace of Electricity is wholly constructed of iron and glass. The length of the facade is 158 meters, and becomes practically a continuation of the Water Castle. The vestibule of the first floor forms an artistic entrance from the Champ de Mars. It is gained by wide approaches and two flights of steps, which gives the ground floor the appearance, on entering, of being located below the surface.

An immense exhibition room of hexagonal form is on the first floor. It is designed to contain the wonders in electrical appliances and to exhibit marvelous lighting effects. This may be aptly termed the Electrical Hall of Honor. Two galleries extend the whole length of the hall.

The engine and boiler buildings are located to the right and to the left, as annexes to the Palace. They are actually the central stations, which furnish the energy for illuminating purposes, for all power requirements and for running the elevators. From these stations cables carry the electric current to the Trocadero, to the Quais, and to the banks of the River Seine, to the Champs Elysées, and to the Esplanade des Invalides.

The boiler grounds are sheltered under a steel shed, 28 by 105 meters. Each yard covers an area of 3,276 square meters. The dimensions of these two machinery halls are 50 by 117 meters.

The front of the Palace is constructed of embossed and open zinc work, composed of 9 spans covered with glass and transparent china in variegated colors. The roof line is surmounted by an open structure, which gives a daylight effect of fine lace work. It is brilliantly illuminated at night. The whole forms a magic decoration and a true apotheosis of electric lighting. The roof is shaped as an immense arc, composed of smaller arcs, which join one another and which are supported by pillars on each side, gradually diminishing upwards in The central span extends towards diameter. the Banquet Hall, and is surmounted by a border bearing the figures "1900." Above it is found a statue representing the genius of electricity. This statue stands upright on a chariot pulled by a dragon, while a Pegasus holds an electrode in each hand; at night a spark one inch long plays between these two electrodes, and an immense star with effulgent rays shines behind the statue.

The great arcade of the Chateau d'Eau forms an opening to a vast hemispherical slope, 25 by 11 meters. The basins are fed from a continuous waterfall, arranged in terraces, which give an increased luminous effect at night, This water spectacle requires 1,200 liters per second. It is fed by a water-raising power plant constructed on the banks of the River Seine. An immense cornice, bearing the coat of arms of the French Republic, forms a center-piece for the vault of the great arcade, which is joined by a double open-work decoration to the two rotundas crowning the back of the pillars at the entrance which admits to the vestibule of the Chateau d'Eau, and which serves at the same time as an entrance to the Palace of Electricity. At the opposite corners of the side passages there are areades symmetrical to those in the center. These passageways form angles of 45 degrees with the main entrance, the arcades terminating at the front in two cupolas, which form the vestibules of the palaces of Mechanical and Chemical Industries.

In another article I shall speak of the appliances, the elevated railroads, elevators and the moving sidewalk, which have been in operation since the opening.

## Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended April 28:

Antwerp, 28 cases, \$2,406; Argentine Republic, 72 cases, \$8,046; Barcelona, 21 cases, \$1,399; Berlin, 55 cases, \$1,120; Brazil, 2 cases, \$175; Bristol, 7 cases, \$400; British Guiana, 1 case, \$55; British Possessions in Africa, 134 cases, \$20,244; Canada, 2 cases, \$110; Central America, 38 cases, \$391; Cuba, 11 cases, \$94; Ecuador, 206 cases, \$1,953; Genoa, 33 cases, \$10,-341; Hamburg, 52 cases, \$3,094; Havre, 25 cases, \$5,485; Kieff, 1 case, \$60; London, 427 cases, \$51,-497; Manchester, 6 cases, \$450; Marseilles, 30 cases, \$300; Mexico, 86 cases, \$3,502; Peru, 28 cases, \$3,328; Porto Rico, 4 cases \$54; Southampton, 96 cases, \$1,329; Stockholm, 2 cases, \$15; St. Petersburg, 9 cases, \$519: U. S. Colombia, 10 cases, \$383.

### Automobile Stations on the Jersey Coast.

The New Jersey Electric Vehicle Transportation Company has arranged to install automobile stations during the coming season at the following points on the Jersey coast: Seabright, West End (Long Branch), Allenhurst, Spring Lake and Atlantic City. At each of these stations Columbia vehicles, both electric and gasoline, of various designs will be for sale, and a specialty will be made of charging and caring for Columbia automobiles owned by private parties. The location of the various stations insures proper accommodations for vehicles and offers a large field for driving. Park wagonettes and omnibuses will be available for special service and for parties wishing to make trips through the surrounding country. The New York Electric Vehicle Transportation Company has opened a salesroom at 541 Fifth avenue, New York City, where all types of Columbia automobiles are exhibited, and

where information regarding prices, etc., can be obtained.

#### National Electric Light Association Convention.

Unusual interest is being manifested by central station managers throughout the country in the meeting of the National Electric Light Association Convention to be held at Chicago May 22, 23, 24. The indications are that there will be a very large attendance of electric lighting men. The programme has been made up from suggestions from central station managers as to their needs, and a glance will show that the themes treated are in the hands of men who thoroughly understand their subjects. Among the papers to be read are the following:

"Uniform Accounting," Lieut, James Blake Cahoon, Syracuse, N. Y.

"Equitable, Uniform, and Competitive Rates," Henry L. Doherty, St. Paul, Minn.

"Central Station Economies," W. L. Abbott, Chicago, Ill.

"Series Inclosed Alternating Arc Lamps," William Lispenard Robb, Hartford, Conn.

Other papers and topics of equal interest will be announced later. The committee reports are also of much value, and promise to be very complete.

## The Philadelphia Meeting of the American Institute of Electrical Engineers.

The 17th General Meeting of the A. I. E. E. will begin on May 16, at 2 P. M., at the Drexel Institute, 32d and Chesnut streets, Philadelphia, and will be continued by morning sessions on the 17th and 18th. Papers will be presented by A. D. Adams, Capt. John Millis, Prof. R. B. Owens, Fitzhugh Townsend, Capt. G. O. Squier and Dr. A. C. Crehore, Carl Hering and Prof. W. H. Freedman. The Philadelphia Local Committee, C. A. Bragg, chairman, has in contemplation, among other events, the following social functions: Afternoon sail down the Delaware, and shad dinner for ladies. Gentlemen's smoker. Visit to Cramp's ship-yard and shad dinner at Washington Park, Gloucester. Ladies' Automobile trip, including visit to Girard College. Evening theater party. Organ recital, Drexel Institute.

#### PERSONAL MENTION.

Mr. Thomas P. Amoss, vice-president and general manager of the Automobile Company in Baltimore, Md., was instrumental in forming the Autocarrette Company at Washington, D. C. Mr. Amoss is now arranging to organize a similar company in New York State, and build for its use five of the same style of vehicles.

Mr. W. Kesley Schoepf, formerly general manager and engineer of the Baltimore Security and Trading Company, has gone to Pittsburg, Pa., to accept the position of general manager of the Consolidated Traction Company of that city, and will hold the same position in the Union Traction Company, which combines the street railways of Pittsburg into one system.

Mr. Clark L. Ingham, of Buffalo, N. Y., general man ager of the Niagara Falls Gas & Electric Light Company, has succeeded Louis A Boore as superintendent of the company's plant at Niagara Falls.

Mr. H. J. Wilson Humbird, has been elected a director in the Cumberland (Md.) Electric Railway Company, to fill the vacancy caused by the resignation of ex-Governor Lloyd Lowndes.

Mr. Herschel A. Benedict, of Albany, N. Y., who for several years has been the electrical engineer of the Hudson Street Railway, has been appointed chief engineer of the United Traction Company.

Mr. Edwin Holmes, president of the Holmes Electric Protective Company of this city, celebrated his 80th birthday on April 25. He received the congratulations of numerous friends and a large number of employes of the company, many of whom have been with him from twenty-five to thirty five years.

#### INCORPORATIONS.

The City Lighting Company, Peru, Ind.—to furnish electric light and power. Capital stock, \$25,000. Incorporators: S. V. Parrott, H. C. Ulen and A. G. Parrott, all of Peru.

The B. B. Electric Company, New York City. Capital stock, \$30,000. Directors: J. T. Beswick and David Beswick, Brooklyn; E. Nicholson, New, York City.

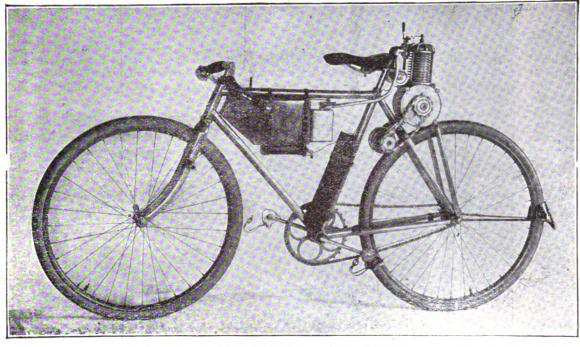

The Port Washington Electric Light, Heat & Power Company, Port Washington, N. Y. Capital stock, \$7,500. Di

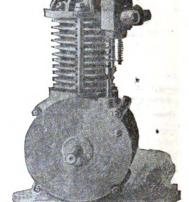

#### COMMERCIAL PARAGRAPHS.

#### NEW STYLE OF AUTOMOBILES.

Automobiles are now within reach of the ordinary business man and the middle classes. Up to three months ago the prices for automobiles ranged from \$1,000 to \$5,000 each, but lately the price has been reduced to \$750 and upwards. A new company has been formed bearing the name of the Crescent Automobile Manufacturing Company, and organized under the laws of Delaware with a capital stock of \$500,000,

have tried and failed, and that is to overcome the inertia without jar to the occupant. The motor is first started by a small wheel situated on the right of the operator, and in about one minute full 4 hp. is obtained; then the transmission gear is applied and the start is made at the rate of one-half mile per hour, the occupant being hardly aware of the carriage having started, and the operator can then run his vehicle to any desired speed. The motor mounted on the bicycle shown is claimed to have run over 3,200 miles without repair and is today in as good condition as when first built. The company's small motor is especially adapted for bicycles of any make or

P-T CRESCENT 1 HP. MOTOR, \$75.

## CRESCENT MOTOR BICYCLE.

rectors: Charles F. Lewis, L. B. Smull, J. O'Brien, John J. McDermott and John H. Burtis, all of Port Washington.

The Keystone Electric Company, Philadelphia, Pa,—to engage in manufacturing, engineering and construction work. Capital stock, \$200,000.

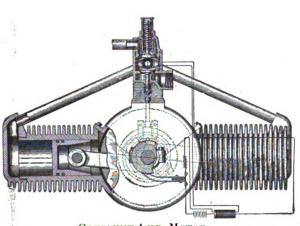

The Urbana Merchandise Electric Railway Company, Urbana, O.—to own and operate a railway. Capital stock, \$100,000. Incorporators: H. A. Axline, C. McDonald, G. W. Hitt, J. B. Johnson and E. M. S. Huston.

The White Oaks Electric Company, Santa Fe, N. M.—to construct telegraph, telephone and electric railway lines.

divided into 500,000 shares of the par value of \$1, of which \$400,000 will remain as working capital. This company is building very handsome carriages and runabouts. One of the accompanying cuts shows a \$550 Stanhope model, which makes a very elegant appearance. The motive power consists of a 4 hp. gasoline motor, also manufactured by the company, which weighs exactly 83 lbs. The running frame of this carriage is built upon sound principles. The frame consists of two rectangular forms lying parallel to each other and held together by a brazed joint. This is mounted upon the axles in the rear by two strong clamps and on the front by a king bolt running from rear to front, allowing the frame

description, as it only measures 11½ x 5 x 6 inches and weighs only 20 lbs, complete with all necessary attachments and accessories, and the general principle of mounting to bicycles is accomplished by having a couple of rear stays and bracing motor to the rear wheel. No knowledge of machinery is required to do this. As to transmitting the power, this is accomplished by a friction wheel, which grips the tire of the hind wheel, and by two sprockets the speed is obtained; loosening one small bolt disconnects the motor and the rider can pedal if he so desires—The 1 hp. motor s-lls for \$75 and \$100, complete, ready for attaching to bicycle.

The company claims that all Crescent vehicles, bicycles and

CRESCENT 4 HP. MOTOR.

Capital stock, \$10,000. Directors: Paul Mayer, Robert E. Lund, George L. Ulrich, Jones Taliaferro and John Y. Hewitt.

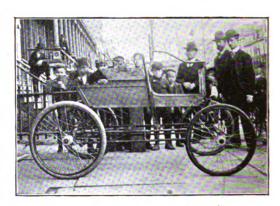

The Shoenberg Electrical Company, San Francisco, Cal.—to do an electrical supply business. Capital stock. \$20,000. Incorporators: A. S. Wadleigh, of Oakland; M. H. Shoenberg, G. A. Gott, L. Arzuer, H. Shoenberg, all of San Francisco.

The Manchester Light, Heat & Power Company, Manchester, Va.—to manufacture and sell gas, electricity, heat, etc. Capital stock. \$50,000. Incorporators: A. L. Anderson of Bon Air, G. E. Gary, A. J. Daffron, W. P. Mathews, A. Royall, E. H. Wells and C. Vadon, all of Manchester.

CRESCENT STANHOPE, \$550.

on which the machinery is attached to remain on a level plane, regardless of the angle of the wheels. The steering gear is controlled from the carriage to the front of the front axle, and by its peculiar mechanism allows the gear to be locked, thus doing away with the oscillation of the front wheels, which has heretofore been one of the prominent defects of the other style of automobiles. Other special features worth mentioning are the continuous axle on the rear wheels on which the compensation gear is mounted; by causing a shoulder thereon it is able to get an unequal speed in turning corners, and the motor being mounted upon the frame on wooden seats does away with the vibration now found in other vehicles operated by gasoline. In the transmission gear has been accomplished, it is said, what others

No. 2 STANHOPE, \$650.

tricycles can climb a 15 per cent. grade, and it is now building motors from 1 to 5 hp. in quantities for immediate delivery. The inventor, Mr. M. E. Toepel, supervises the motor department, and under his able direction first-class workmanship is guaranteed. The noted expert on automobiles and motors, Mr. Walter K. Freeman, is doing the company's drawing and designing. (n the first of May several carriages were completed and the company is now working hard to complete 25

Some very able men are interested in this company, prominent among them being Mr. Henry Cohen, of 66 Grand street, formerly at 604 Broadway, New York City, and his energetic methods in the managing of this company has brought it to this favorable condition, and while he is at the head of this

corporation there is no doubt that it is assured an enterprising, reliable and successful management. Mr. John Kelly, the treasurer is also a business man of repute, having large boot and shoe houses in Amsterdam, Sharon Springs, and >t. Johnsville, N. Y. Mr. G. W. Dorsey, the secretary, is a wellknown and successful man of Wilmington. Del, and is now the manager of the Delaware office of the Realty & Trust Co., in this city. Mr. Ellis, the manager of the carriage building department, has had experience for over 20 years in one of the largest carriage factories in this country.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 502-504 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and tills of invention wanted.

#### AUTOMOBILES.

Baltimore, Md.-The Automobile & Manufacturing Company of this city has recently turned out its first electric delivery wagon. It will carry 1.200 pounds and is equipped with a four and one-half horse power motor which is capable of an overload of 150 per cent. There is also a battery of 100 amperes, 80 volts capacity. The new wagon has been tested on cobble-stones, belgian blocks and asphalt, and it is stated, can move up any bill in the city faster than a horse drawn vehicle. any hill in the city faster than a horse-drawn vehicle. The speed on a level is 12 miles an hour. The first test made was satisfactory.

### GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Baltimore, Md.-The board of directors of the Maryland Penitentiary is considering plans for the improvements at the institution, for which the Legislature recently granted \$150,000. The first work will be the wiring of all buildings from the electric plant. Electricity will be used to furnish light, heat and power to all the shops.

Bowling Green, Ky.—M. H. Crump, secretary of the Commercial Club, is in the market for a 5,000 incandescent light plant.

Cass Lake, Minn.-General A. Hughes of Fargo, N. contemplates establishing an electric light plant at this place.

Clinton, Ia.—Plans have been prepared for a new electric light and heating plant for the State University to cost \$25,000.

Florence, S. C.—The Florence Improvement & Manufacturing Company, which owns the electric light plant in this city with J. P. Chase as manager, contemplates making extensive improvements at an early

Fort Collins, Col.-A special committee has been appointed to consider the question of electric lighting of this city, and the feasibility of municipal ownership.

Fort Totten, N. D.—The appropriation for an electric light plant at this place will be increased \$4,000.

Griswold, Ia.—Messrs. Seeley & Haggemeister con-template the erection of a new electric light plant.

Hagerstown, Md.—This city will build a ₹49,000 electric light plant. Plans and specifications will soon be prepared. Address J. W. Recher, clerk.

Pine City, Minn.—The Richardson Electric Company of Duluth, Minn., has purchased the electric light plant at Pine City and will make a number of improve-

The Philadelphia & Reading Railway Reading, Pa.resuling, ra.—Ine rinadelpina & resuling hanway proposes a new departure from end to end of its system in the way of establishing a complete series of electric light plants to take the place of existing methods, and to meet a situation that has long been a necessity. Eilis E. Brown is the electrical engineer.

Red Bud, Ill.—It was voted recently to appropriate \$10,000 for the purpose of erecting an electric light

Sacramento, Cal.—Plans are being prepared for the erection of a new electric light plant for this city.

San Francisco, Cal.-City Engineer Grumsky will soon receive bids for erecting a municipal electric light

Snow Hill, Md.—Bonds are to be issued to build an electric light plant here.

Weatherford, Tex —The city council has granted a franchise for an electric light plant to J. L. Sales of Dallas, Tex.

## STREET RAILWAYS.

Columbia, Pa.—Work on the Montour-Columbia Electric Railroad, which will connect Danville, River-side, Bloomshurg, Espy, Berwick and Nescopeck, will begin soon. The surveys have been made, and bids for its construction are invited.

Chicago, Ill.—Electricity will take the place of the horse cars on the State street and the Wabash avenue and Cottage Grove avenue lines of the Chicago City

Escanaba, Mich.—The directors of the Escanaba Electric Railway have decided to extend their line from this city through Gladstone to Rapid River, a distance of twenty miles.

Lackawaxen, Pa.—The State Railroad Commissioners recently granted to the Delaware Valley & Kingston Railway Company the right to build an electric road along the line of the old Delaware & Hudson Canal. It will extend from this place to tidewater at Kingston, N. Y. The New York line will be 81 miles long, to be operated in conjunction with a line in Pennsylvania 16 miles long, extending from Lackawaxen to Hawley, where it will connect with the Eric & Wyoming Railroad.

Lewinsville, Va.—A suburban railroad project is being worked out which, it is expected, when all the plans are realized, will result in the building of an electric road from the Virginia end of the Aqueduct bridge through Virginia toward the north, following the banks of the Potomac, although at some distance from the shore line, to the Great Falls. At this place it is proposed to build a line that will extend to Fairfax Court House, passing through Vienna and other towns on the Southern Railroad.

Milford, N. H.—A survey is to be made for an electric road from here to Mt. Vernon.

Parkersburg, W. Va —The directors of the Ohio Valley Electric Railway Company have awarded the contract for the construction of an electric road from Catlettsburg. Ky., to the upper end of Central City, W. Va., to Kerr, Fox & Co., of Huntington. The company is constructing electric lines throughout the entire valley.

Rushville, Ind.—H. Probasco, of Cincinnati, has been here looking over the field for an electric car line from Rushville to Indianapolis.

Washington, N. J.—The village council recently granted a franchise for a trolley road through this village to the Philipsburg Horse Railroad Company.

#### MANUFACTURING.

Baltimore, Md.—The Automobile & Manufacturing Company has received an order for about \$40,000 worth of machines from the American Autocarrette Company of Washington, D. C.

Boston, Mass.—The National Electric Hose Signal Company of this city was recently organized with a capital of \$150,000, for the purpose of manufacturing and selling electric hose batteries, wires and signals.

Camden, N. J.—The Sun Electric Company proposes to locate a plant in this city, where it will manufacture electrical appliances and employ about 600 hands.

Mansfield. O.—The Aultman-Taylor Company of this city has the contract for furnishing the latest improved Babcock & Wilcox boiler for the new electrical power plant of F. E. Myers & Bros. of Ashland, O.

New York City.—The Beberts Battery Company of this city, of which Edmund Tweedy, of 11 Broadway, and Isaiah L. Boberts are the directors, will manufac-ture electrical machinery and batteries on a capital of

Philadelphia, Pa.—The Rumsey Manufacturing Company of this city is to furnish the electrical supplies for the electric light plant at Pulaski, Va.

#### COMPANY MATTERS.

Beaver, Pa.—A party of New York capitalists has been here negotiating for the purchase of the Beaver Valley Traction Company's lines, the line of the Riverview E'ectric Street Railway Company, and the plant of the Patterson's Heights Incline Plane Company.

Gloucester City, N. J.—The Gloucester City Electric Light Company changed hands yesterday, having been purchased by the American Investment Com-

Kansas City, Mo.—The Edison Electric Light Com-Kansas City, Mo.—The Edison Electric Light Company and the Kansas City Electric Light Company of this city, and the electric companies of Kansas City, Kan., have been consolidated into two companies—the Kansas City Electric Light Company in this city and the Consolidated Company across the line. The capital stock has been increased to \$2,500,000 for both companies. Contracts for \$500,000 worth of new machinery to be placed in the Riverview power house have recently been closed.

Pittsfield. Mass.—A site for the proposed new shops of the Stanley Electric Manufacturing Company has recently been secured in the Morningside section of this city.

Richmond, Vs.—The Bichmond Passenger & Power Company is now in possession of all the electric lines in this city and Manchester except those controlled by the Traction Company. The lines are to be reconstructed, and better service is promised.

Shenandoah, Ia.—The city council recently granted the Electric Light & Power Company permission to use the streets and alleys for the purpose of installing a hot water heating plant.

Tarrytown, N. Y.—The Hudson River Gas & Electric Company of Westchester County, has been absorbed by the United Gas & Improvement Company of Philadelphia. It is claimed that the plant is to be improved and extended.

### POWER AND TRANSMISSION PLANTS.

Gaffney, S. C.—Plans are being perfected for the development of Gaston Shoals, near here. H. D velopment of Gaston Shosis, near here. H. D. Wheat, president of the Gaffney Manufacturing Company, has purchased that property with a large tract of land on either side of Broad River, and is now organizing a company to develop the water power. Au electric power plant will be installed and power transmitted to this place and Spartanburg and other nearby towns, while several towns will be furnished with electricity for lighting purposes

Hinsdale, Mass.—An electrical engineer has lately been looking over the lower Plunkett water privilege at this place, called the Jerico dam, with the view of using the power for a plant for the proposed Dalton-Hinsdale electric road and to furnish light and power for these two places. The water supply is one of the best on this branch of the Housatonic River and with the Plunkett and Ashmere reservoir it can be made one of the best locations for a plant in this section.

San Jose, Cal.—The Standard Electric Company, which has its plant at Blue Lakes, Alpine County, is preparing to begin active operations in San Jose and Sants Clars Counties. In this city an immense storage plant will be erected, so that in case of an accident the company will have sufficient power to last for several days. Nearly all the country towns will be supplied, and farmers and fruit growers will be able to make use of the power.

St. Paul Minn —The St. Croix Power Company is

St. Paul, Minn.-The St. Croix Power Company is constructing a power house at Apple River for the transmission of electricity to this city. It will take about a month to complete the dam. Power will be furnished late in July.

# THE TELEPHONE WORLD.

#### May Fight the Bell Again.

A dispatch from New Orleans, La., states that there is considerable talk of organizing an independent telephone company to take the place of the defunct People's Company, and to continue the fight against the Bell monopoly, operated under the name of the Cumberland Telephone & Telegraph Company. The present plan is to have the new company controlled by the city in a manner similar to that proposed in Chicago.

Two years ago an independent company was organized by Detroit men, which styled itself the People's Company, and bonds for \$400,000 were floated for the purpose of establishing the new company's system.

ing the new company's system.

The people of New Orleans, who were tired of the high rates, and the despotic actions of the Cumberland Company, gave the People's Company every possible encouragement, even to the free use of the streets.

The new company set up its lines, reduced the rates considerably, and was giving a satisfactory service in every way, when it was suddenly announced that it had sold out to the Bell Company. The monopoly was re-established and rates were raised to the old level.

Referring to the plan of the Massachusetts Telephone Company to construct a long distance trunk line telephone system from Boston to Chicago the Springfield, Mass., "Republican" "There is a syndicate of 10 New York capitalists behind the plan, and there is said to be \$50,000,000 back of it. An effort will be made to buy out the New England Telephone & Telegraph Company's system in Massachusetts and Northern Rhode Island and Southern Vermont and New Hampshire to the New York State line. A bid will be made for the American Bell Company's system through New York and Massachusetts. The Massachusetts Telephone & Telegraph Company, which has been striving to obtain franchises from Boston to the western edge of the State, will be the Massa, chusetts end of the big system. The syndicate proposes to build a 40-wire trunk line through to Chicago. The company is prepared to offer to the people of Massachusetts telephone rates 60 per cent. lower than those granted by the established companies."

At a recent meeting of those interested in the Farmers' Telephone Company of Canastota, N. Y., a stock company was formed with a capital stock of \$1,000, with the idea of increasing shares at \$25. The directors chosen were: R. D. Button, Cyrus Warlock, Milton Jennings, Charles Taber, H. R. Murray, John Souter and D. C. Twogood. The line proposed to be set up will run from Perryville through Canastota to South Bay, Sylvan Beach, Oneida Lake and Lakeport. Each subscriber of stock buys his own telephone, and receives free service. Another meeting is to be held soon, when further arrangements will be made.

The Northville (Mich.) Telephone Co. has contracted with Chicago parties for the construction of a new switchboard for its central office. It will be of the very latest improved patent, wired for either metallic or ground circuits or both and will be of sufficient capacity to accommodate 200 subscribers. The Northville Company was organized about three years ago and now has 100 subscribers, with a number of orders ahead awaiting the advent of the new board. The local rates are 50 cents to \$1 per month and the company gives both night and day service.

Advices from Norton, Kan., state that most of the county seats of northwestern Kansas are agitating the question of putting in a telephone line connecting the various places, giving also the smaller towns connection with the county seat. All crops have yielded so bountifully within the last few years that the leading farmers find themselves amply able to have conveniences, which, if suggested in the short grass country a few years ago, would have been laughed at,

The city of Bessemer, Ala., has passed an ordinance granting to S. B. Claypool, his associates and assigns, the right to the use of the streets and avenues of the city of Bessemer for the purpose of erecting poles and other necessary appliances to be used in maintaining a telephone system. One of the principal conditions is that not more than \$3 per month shall be charged for business houses, nor more than \$1.50 for residences.

At a meeting of the county board of assessors at Wood bury, Pa., recently, it was agreed to assess the poles and wires of the different trolley lines and telephone companies. The plan adopted is to send to these companies and get their valuation, and if this is not furnished the assessment will be made at the assessors' valuation.

The advisory board of the Independent Telephone Association of the United States has fixed the annual meeting for Cleveland on June 12, 13 and 14.

#### Detroit and Marquette Service Established.

Long distance telephone service between Detroit and Marquette, Mich., has been established by the Michigan Telephone Company. The construction of the new line was pushed right through the winter and a few days ago the last mile of wire was strung between Petoskey and Mackinaw City. The line from St. Ignace to Marquette was finished some weeks ago, and as the cable across the straits was laid last fall, all that remained to be done was to connect the circuits and clear up certain details of equipment to put the service in good shape. Satisfactory conversation has been held between Detroit and Marquette, and tests have also been made between Marquette and Cleveland, Marquette and Pittsburg, Pa., etc.

The line is an unusually long one when it is considered that connection is made at the straits with the longest submarine cable in the United States.

E. D. Trowbridge, general superintendent of long distance service, is reported as saying:

"We are building a line from Marquette to Houghton and another line from St. Ignace to Sault Ste. Marie. These lines we hope to have in operation by June 1, so that within five or six weeks we shall have connection with all important stations in the upper peninsula. The line just opened gives us connection with St. Ignace, Trout Lake, Soo Junction, Seney, Newberry, Marquette, Michigamme, Ishpeming, Negaunee, Republic and some ten or twelve other stations. The building of these lines is of considerable importance in the telephone world, and the lines are of much more importance to the subscribers of the Michigan Company in opening up a lot of new territory. There are several hundred Detroit people who have a financial interest in the new lines. The Michigan Company had a large number of local stockholders, and through the recent consolidation with the Detroit Telephone and New State Telephone Companies added over 1,400 Michigan people to its list of stockholders, making a total of probably 2,000 residents of the State that are now stockholders in the company."

J. Kajiura, of Tokio, Japan, an electrical engineer, who has been studying the different systems of the telephone and telegraph in Europe for the benefit of his Government, is now in Chicago. Mr. Kajiura is connected with the department of communication of the Japan Government. In the last year he has visited the principal cities of England, Scotland, Ireland, France, Switzerland, Italy, Germany, Austria-Hungary, Belgium and Holland. He arrived in New York two weeks ago. He will remain in Chicago ten days studying the telephone and telegraph systems there. Mr. Kajiura says America has the best telephone system, and England the best telegraph. In Japan the Government owns both these systems. On this account the extension and improvement of the systems is very slow, as nothing can be done without an act of Parliament. The Government appropriates a certain sum each year, and the expenses of operation and improvement must not exceed this sum. Mr. Kajiura thinks Government ownership of these lines in this country would cause great dissatisfaction, inasmuch as Americans would not be willing to wait for Congress to act every time an extension of service was required. While he finds the telephone subscription charges much higher in America than in England and on the Continent, he says the service is much more comprehensive, and in reality quite as

The Black River Telephone Company, now doing business in this State, is said to be meeting with great success. The company was incorporated under the laws of the State of New York with a capital of \$25,000. The directors for the first year are H. C. Markham, of Lycn's Falls; Benedict Gantner. Pasadena; F. C. Myers, West Leyden; David Swancott, Lee Center; Frank Harrington, Delta; S. C. Capron, Leyden; Philip J. Domser and John J. Domser, Boonville, Officers for the first year are H. C. Markham, president; B. Gantner, treasurer; S. C. Capron, secretary; F. C. Meyers, vice-president; John J. Domser, general manager.

The Rawson Electric Company of Elyria, Ohio, turned over the Home Telephone Company plant to the Home Company of Niagara Falls on May 1, at which time the concern began business with a completed line. The Home Company started business with over 500 subscribers. Conferences are being held between the Home and Bell Companies, and it is likely that some agreement will be reached in the near future.

The village of Jacksonville, Vt., will soon be connected by telephone with Heath, Charlemont, Shelburne Falls, Colrain and other places.

Excavations are progressing for the new long-distance telephone building to be erected in Lansingburgh, N. Y.

## An Automatic Pay Station Telephone Attachment.

Ever since the more general introduction of the telephone, there has been a demand for an arrangement whereby the unlimited service rendered the public can be served at a profit instead of a loss to the telephone companies, and while some attempts have been made to solve the problem, the result was generally a large complicated and expensive piece of apparatus requiring usually an extra set of batteries for operation.

Every telephone company has more or less felt the loss of placing telephones in public places which are used by others than the subscribers without compensation of any kind for the service rendered. The Dinsmore Automatic Pay Station Telephone Attachment not only stops free service but makes it possible to place telephones in places where there has been a demand without a subscriber. It makes each user pay for the use of the telephone.

The Dinsmore attachment is devised for use with any telephone or system, and made in two styles: A for receiving a nickel, and B to take a 25-cent piece. If toll is 5 cents, drop single coin; if 10 cents, drop two 5-cent pieces. The mechanism is simple and durable, nothing to get out of order. nothing to wear, and is enclosed in iron case with slot opening at top sufficiently large for a 5-cent piece or a quarter. It is fitted with a Yale lock, making it secure from intrusion. It is simple to operate and easy to attach, and once placed it requires absolutely no attention except the collection. A connection cannot be made until after coin has been deposited, which notifies the operator to connect.

One great advantage is, that it does not require any extra battery, being connected in multiple with the transmitter in the primary circuit of the induction coil.—The "Telephone Magazine," Chicago.

The Hudson River Telephone Company has purchased property adjoining its present building in Albany, N. Y., and will erect a large addition, making the building 46 feet on Chapel street and 88 feet on Maiden Lane. The addition will be granite and five stories in height. The work will be commenced June 1 and is expected to be finished by November 1. The company has in Albany about 3,150 telephones, and they are increasing at about 100 per month.

Bell telephone gossip from Boston asserts that the first year after the exchange of stock into that of the Long Distance Company is effected, will see \$10.50 paid on each share. That is, the two shares which will be given for one share of Bell will get \$7.50 in dividends, 6 per cent, regular and 1½ per cent. extra, and the right to subscribe for new stock is figured at \$3, with more rights to follow in future years.

The Eastern Telegraph & Telephone Company, which was recently incorporated in Trenton, N. J., proposes to be a strong rival and competitor to the Bell Telephone Company. One of the first places they will start the fight is in Camcen, Judge E. A. Armstrong, former city counsel J. Willard Morgan, John J. Burleigh and ex-Sheriff Daniel Baird are among the principal stockholders. The company promises cheaper telephone service.

The proposed city charter fixes telephone rates in Minneapolis at \$48 per year for business 'phones, and \$24 a year for telephones in residences. These rates are far less than those now charged by the Minneapolis companies. Everywhere the story is the same. Where there is no competition the rates are higher than where there is.

#### TELEPHONE INCORPORATIONS.

The Centralia Telephone Company, Centralia, Mo. Capital stock, \$6,000. Incorporators: J. A. Chance and A. Bishop Chance.

The Eastern Telegraph & Telephone Company—to operate lines in New Jersey. Capital stock, \$250,000. Incorporators: J. W. Morgan, John J. Burleigh, and E. A. Armstrong of Camden, N. J.

The Franklin County Telephone Company, Malone, N. Y. Capital stock, \$8,000. Incorporators: E. B. Ferensen, J. A. Crawford, M. S. Crawford, N. S. Ferensen, John Chambers, R. L. Crawford of Hamden, and Frederick C. Ward, Delhi.

The McKin Telephone Company, St. Mary's W. Va. Capital stock, \$50,000. Incorporators: R. H. Browse, O. Gorrell, B. F. Sockman, A. Eddy, W. C. Dotson, all of St. Mary's.

The Overton Telephone Company, Livingstone, Tenn.—to conduct a general telephone business. Capital stock, \$5,000. Incorporators: H. Hatcher, M. Miller, H. R. Vaughan, R. H. Hawkins, W. H. Hawkins, all of Livingstone.

## NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 163@17c.; Lake, 17@17&2.; casting, 164(417c.

The Massachusetts Electric Company has declared a dividend of 2 per cent. on its preferred stock, payable June 1 to stock of record May 15

The Columbus & Lancaster Traction Company, of Columbus, O., has decided to

increase its capital stock from \$500,000 to \$1,000,000.

The National Carbon Company has declared a dividend of 13 per cent. on its preferred stock, payable May 15. Books close May 5 and reopen May 16.

The United States Automatic Telephone Company of New York certifies that it has paid in one half of its capital stock, which amounts to \$1,000,000.

The Poonle's Gas & Electric Company of Oswego, N. Y., capital \$450,000, and Niagara Falls Milling Company, capital \$200,000, have been incorporated.

Governer Roosevelt has vetoed the Sullivan bill, which allowed electric light

The American District Telegraph Company has declared a dividend of 1 per cent., payable May 15. George B. Wilson has been added to the executive committee.

It is officially announced that the plan for the consolidation of the Welsbach Light Company and the Welsbach Commercial Company will be made public in a tew days.

The Westinghouse Electric & Manufacturing Company has declared a quarterly dividend of 1½ per cent. on its assenting stock, payable May 15. Books closed May 1 and reopen May 16.

It is understood that a proposition looking to an increase in the capital stock from \$18,000,000 to \$20,000,000 will shortly be submitted to stockholders of the Columbus (O.) Street Railway Company.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 22(226; New York Electric Vehicle Transportation, 11(2); New England Transportation, 4½(25); Gramophone, 42(45).

The new management of the Taird Avenue Railroad of New York, which is now under Metropolitan Street Railway control, has reduced the wages of the motormen fully 10 per cent. and effected a saving estimated at \$70,000 a year.

The United Gas Improvement Confoany of Philadelphia has purchased a controlling interest in the Hudson River Gas and Electric Company. The purchase is made out of the proceeds of the sale of the \$7,500,000 new stock of the United Gas Improvement Company.

The market for copper during the past week has been very quiet with very little business doing, and what little business going on has been done on old contracts. The export business has been good and amounts for April to 11,276 tons, as per Metal Exchange returns.

The report of the New York Electric Vehicle Transportation Company for the fiscal year ended December 31, 1899, shows the following: Gross earnings, \$156,568; operating expenses, \$145,189; net earnings, \$11,279; other income, \$28,293; total net income \$39,670; patents, etc., \$4,768; balance, \$34,931.

A dispatch from Ch cago states that the Metropolitan West Side Elevated Railway Company's traffic for one twenty-two days of April, which includes four Sundays, approximately increased 19 per cent. over the same period of last year. The management believes that the net earnings will show a gain of about 19 per cent. for the month.

At the annual meeting of the Electric Company of America, held at Camden, N. J., the following directors were re-elected: A. Louden Snowden, William L. Elkins, P. A. B. Widener, Martin Maloney, Thomas Dolan, William J. Latta, Charles A. Porter, Joseph B. McCaull and James E. Hayes. The company's assets are \$3,900,405.35. Dividends amounting to \$202,419 were paid.

The annual statement of the United Railways and Electric Company of Baltimore, submitted at a meeting of the executive committee, made the following showing: Gross earnings, April 1, 1899, to March 31, 1990, \$4 3)4,932 68; operating expenses, taxes, etc., \$3,734,896 35; surplus, \$570,046 31; interest on income bonds and preferred stock, \$560,000; surplus, \$10,046; surplus United Electric Power, eleven months, \$82,013.80; total surplus, \$92,059.

With an authorized capital stock of \$8,000,000, of which \$2,500,000 already is subwith an authorized capital stock of \$5,000,000, of which \$2,500,000 already is subscribed for, the Cuba Company was incorporated in Trenton, N. J. The stock is divided into shares of \$50,000 εach. The incorporators are W. C. Van Horne, Levi P. Morton, W. C. Whitney and Thomas Ryan, holding eight shares each; C. G. Hanen, six shares; E. A. Harriman and James J. Hill, four shares each; William L. Bull, three shares, and H. L. Terry, one share. The company is to operate steam railroads and electric lines in Cuba.

President John E. Hudson of the American Bell Telephone Company notifies stockholders by circular that in pursuance of the vote passed at the amnual meeting on March 27 that there be distributed to stockholders two shares of the stock of the American Telephone and Telephone at Telephone stock, the treasurer will on May 15 begin to make the exchange of stock. Receipts will be furnished stockholders upon deposit of their certificates with the treasurer. The company will affix all revenue stamps.

It is announced that James R. Krene has left Wall Street forever, that before sailing for Europe on Saturday to recuperate his health he closed up all of his deals and departed with a fortune estimated all the way from \$12,000,000 to \$20,000,000, which is offset by ill health and shattered nerves. The absence of this great operator from Wall Street, even though for a short period, must have an effect upon the market. His work has generally been upon the short side of the market, the drive against Brooklyn Rapid Transit being one of the mest conspicuous, as well as one of his most successful moves. of his most successful moves.

The New York State Board of Tax Commissioners made public on April 39 the final valuations on the franchises of the street railway companies and lighting corporations operating in Greater New York. The final values are: Metropolitan Street Railway Company, \$52,292,317; Manhattan Elevated Railway Company, \$46,127,000; Brooklyn Rapid Transit Company, \$28,867,669: Third Avenue Railroad Company, \$16,93,101; Edison Electric Company, New York, \$8,091,328; Edison Electric Company, Brooklyn, \$2,423,891. The final valuation of all the franchises owned by the companies mentioned is \$29,596,446 less than the value fixed by the Commissioners early in April.

The Philadalphis "Stockholder" saws: "Procklyn Parid Transit steels have

Commissioners early in April.

The Philadelphia "Stockholder" says: "Brooklyn Rapid Transit stock has many friends in the Street who claim that its prospects are very bright, and that on these alone it should seek a higher price level. No doubt is expressed that the system is a great earner. Certainly it must be, traversing, as it does, a wide, growing and thickly populated territory. Of the total capital stock of \$45,000,000 there is outstanding \$13,000,000. Par value of shares is \$100 each. To pay a dividend at the rate of 2 per cent, on the stock issued would require \$860,000. It is understood that business of the company is rapidly increasing, and those close to the management predict that if even the present rate of gain is maintained throughout the present year a dividend of not less than 2 per cent, will be shown earned on the stock. As a result of operations for 1898 there was shown a surplus, after all interest and fixed charges, etc., of \$413,853. Since that year the company is understood to have made material progress in the right direction, and it would not be surprising, therefore, to see the stock placed on a dividend-paying basis before a great while."

### EDITORIAL NOTES.

The Thermopile.

As is well known there are a number of ways of producing an electric current, as for instance,

by means of a prime mover attached to an electric generator, such as a steam engine, gas engine or turbine, by means of a primary battery, in which an acid solution acts on carbon or metal plates by friction, as in the case of the static machine, and lastly, by heat. The three first methods are in common use, and while inventors have long been at work endeavoring to devise a means for converting heat into electricity direct, no really satisfactory results have been obtained.

This is all the more to be regretted in view of the fact that such an invention if made to work satisfactorily would prove of great value, and would undoubtedly be the means of effecting a financial saving in the generation of electrical power. Any step tending to the solution of this problem is of interest, and it is therefore worthy of note that letters patent were issued on May 1 to a resident of Pueblo, Col., for a thermo-electric generator, which, according to the description, differs somewhat from any heretofore brought out. What the inventor claims is: "In a thermal electric generator, a body having a heated area consisting of a series of electrically-connected vessels containing stored heat and a heat-generator, flexible conductors of electricity connected with separate parts of said body, and a shell composed of different metals having a cold area, and a diaphragm extending from one inner side portion to the other over the said cold area, and in direct electrical connection with said conductors."

Probably the most successful thermopile yet devised consists of a series of castings, composed of alloy of antimony and zinc, connected by thin strips of copper. The casting has to be done at a high temperature and under pressure to insure homogeneity of product as well as to make a complete junction between the copper strip and the alloy. The couples are subjected to an annealing process by which the alloy, which would otherwise be exceedingly brittle, is hardened and toughened. In the pile referred to, a number of elements are formed into a ring and a number of these rings superposed form a hollow cylinder, the interior and exterior of which are covered with cement, and

the whole enclosed in a sheet-iron water-jacket cover ready for use. A Bunsen flame, which occupies the axis of the cylinder, is deflected against the interior cylindrical surface by a series of reflectors.

With such a thermo electric generator it was possible to operate a small fan motor, an electric bell or a medical coil, with a consumption of gas of about 21 cubic feet an hour. The principal drawbacks to a thermopile of this description lie, first, in its great internal resistance, and, secondly, in the fact that the alloy in becoming alternately hot and cold is apt in time to oxidize and cause the pile to fail. Furthermore, it is almost impossible to manufacture two generators that will have the same output, and until these defects are overcome the thermopile can hardly be called a commercial success, although we understand there are a number in use for various purposes in New York City.

As already stated, however, in view of the great advantages to be derived by direct conversion of heat into electricity, any progress made along this line will be watched with interest, not only by the electrical fraternity but by the whole scientific world.

\* \* \*

Trees Being Electrocuted.

The single conductor overhead trolley system has apparently much to answer for. It is held re-

sponsible for damage to underground pipes amounting to thousands of dollars, and now another grave sin has been registered against it. We refer to what might be termed the electrocuting of trees, regarding which a prominent resident of Bay Ridge, Brooklyn, has this to say:

"Five years ago there was the finest natural archway of trees, between Sixty-fifth street and Fort Hamilton, to be found within the limits of Greater New York. Now, for blocks at a stretch, one tree, at least, out of every three, is blasted, and the others, though they are in leaf in the summer, are losing their vitality, and are surely doomed unless the destroying influence can be averted in some

"I am confident that if the public knew at the time the wires were strung through the trees the effect the leaking electricity would have, there would have been such a kick that the wires would, at least, have been more carefully strung. The public understood that the wires were covered with insulating material, and that even, as in nearly every case, when they touched or rested on branches the trees would be safe.

"I have talked with electrical experts since then and have been told that there is no such thing as an insulating material through which electricity will not slowly make its way. It is only a matter of time before it will leak through any material in such a way as to destroy anything the wires may happen to be in contact with. I think something should be done to save the rest of the trees. Their destruction is an act of vandalism."

The residents of that locality claim that in damp weather electric current leaks through the insulation of the trolley feeder cables where they come in contact with branches of the trees and passing through the latter seeks the ground. In support of this theory it is asserted that not long ago a tree fell, when an examination of its trunk revealed the fact that it was decayed and hollow through a greater part of its length. It is also stated that wherever a cable touches a branch it speedily shows signs of decay and eventually dies. There are any number of trees in this condition in that vicinity, that before the trolley was bullt put forth abundant foliage.

That escaping electric current is responsible for this condition of affairs is very likely, for the best of insulations will occasionally break down after being long in use, and there is no doubt but what a wet tree offers an excellent grounding medium. It is rather difficult, however, to explain why an electric current at a comparatively low voltage should cause a tree to decay and rot, especially when it was reported from Brussels, Belgium, some time ago that stray trolley currents were "stimulating" the trees along a certain avenue in that city and causing them to put forth an unusual number of blossoms.

However, the condition of affairs in Bay Ridge would seem serious enough to warrant a careful examination being made, after which if the trolley companies are found at fault steps should be taken to compel them to more thoroughly insulate their conductors, or better still, to so run their cables that the leakage of current to a tree would be impossible. Such action would serve as a precedent and might in future prevent a similar condition of affairs elsewhere. In fact it is the least that is due to the residents of that vicinity, who naturally take a proper pride in their surroundings.

Signal Corps Work in the Philippines.

General A. W. Greely, chief of the U. S. Signal Corps, was reported as saying that

\*

in the evolution of signaling the flag had largely given away for day work to the heliograph, and he might aptly have added that for field work the wig-wag method has been almost wholly superseded by the telegraph and telephone. In other words, members of a signal corps at the present day should be familiar with electrical apparatus, and be not only electricians, but expert telegraphers as well. When the war with Spain first broke out there was a dearth of electrical workers in the signal service, with the result that the transmission of messages during the early part of the conflict was considerably hampered. This condition of affairs was speedily remedied however, and at the present time the work of the United States Signal Corps in the Philippines is everything that could

be desired, and its efficiency is not only recognized in this country, but in Europe as well. Referring to the recent application of electricity to military purposes the British Superintendent of Telegraphs says: "It is our men's ambition to do as good work as the American telegraphers did for their country in Cuba and Porto Rico. . . . They have given us our ideal, and we will try and work up to it." Without disparaging the work of the Signal Corps in Cuba and Porto Rico, it is safe to assert that the work done by the men in the Philippines under Col. Allen, is equally as efficient if not more so. A Manila dispatch to the N. Y. "Sun," referring to this subject, states:

"Previous to General Lawton's campaign up the Rio Grande last October, and the subsequent routing of the insurgent government at Tarlac by General MacArthur, there were barely 250 miles of telegraph lines in operation under the Americans. With remarkable speed the new lines were erected and telegraph offices established in the rear of the moving troops. Captain Russell was in charge of the Signal Corps detachment that accompanied General Lawton on his muddy tour through the Nueva Ecija country and along the mountains to head off Aguinaldo, and it was owing to some mighty tall hustling by him and his men that General Lawton was able to keep in touch with Manila. The supply of insulated wire ran out, and it was necessary to lay bare wire for miles through the swamps and mire over which the column had to pass. By the aid of the little instrument called the buzzer it was possible to send and receive faint messages over this wire."

What rapid strides have been made in the running of wires may be inferred when it is stated that at the present time there are over one thousand miles in operation on the Island of Luzon. This extensive system is looked after and kept in working order by two companies of one hundred men each. In the district south of Manila the men are distributed among sixty-five telegraph offices and in the district to the north they are taking care of many more.

In the extensive field operations of January last the daily average of messages for the month was 5,000. The field outfit of the corps is something of a novelty. The signal man carries a small box which affords communication either by telegraph or telephone through the buzzer, already referred to. By means of the latter device some wonderful feats are said to have been accomplished in the way of telegraphing over country where the uninsulated wire has lain in mud and water, and Signal Corps men in one instance were able to carry communication past a break where the ends of the wire rested on the ground a foot apart.

In addition to operating and erecting lines the Signal Corps force of Luzon is constantly called upon to mend breaks that have been caused by the natives. This has resulted in the signal men having been under fire in no less than sixty-one skirmishes or engagements with a consequent loss of dead and wounded as great in percentage as any other organization in the Philippines.

AFTER thoroughly testing the apparatus of the General Electric Company, the Westinghouse Manufacturing Company, and the Sprague Electric Company, the directors of the Boston Elevated Railway Company have decided to make use of the Sprague Electric Company's controllers, in conjunction with the Sprague multiple-unit system, on a large number of its cars.

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

THE 300 horse-power generator that was made by the Bullock Electric Company of Cincinnati, O., for the Vincennes Annex of the Paris Exposition, and that was lost at sea, will soon be replaced by a new generator that has just been completed and shipped to Paris.

One of the largest express packages ever shipped out of Washington, D. C. from any consignor other than the Government was forwarded by the United States Express Company last week. The package weighed 2,000 pounds and consisted of electrical machinery, manufactured by the Hill-Murray Company of that city, to be used at Cape Nome for separating gold from sand.

THE Zanesville Coal Company has had an electric motor placed in position at its mine at Crooksville, O. The machine was used last week for the first time and worked perfectly.

CHARLES MURPHY, known as "Mile-a-Minute," has equipped his bicycle with a decided novelty. It consists of an electric storage battery, which is attached to the upper frame tube of the wheel, the switch being fastened to the steering head and the wires covering the handlebars and connecting with a storage battery at the rear of the saddle post. By grasping the wires Murphy claims a sufficient shock is given his arms to penetrate his whole body and give him a sense of renewed activity when needed in a spurt. Murphy says he is using this device with good results.

The Eric Railroad on May 4 introduced telephones to supplant the present telegraph system in its block signal towers. A school of instruction has been conducted at Port Jervis for the past month for the purpose of instructing men in the new system. It is alleged that the reason for the railway company's new departure is to be independent of the telegraph operators, who are forming a telegraphers' organization. The system was first introduced on the Delaware Division of the Eric.

THE United States Government has appointed Mr. Carl Hering an official delegate to the Paris International Electrical Congress, which will be held in the French metropolis from August 18 to 25.

THE Park Board of Detroit Mich., has authorized the construction of a rather novel electrical fountain for one of its parks. The basin will be 40 feet in diameter and the fountain proper will comprise five cobblestone columns, from the apex of each of which will burst a stream of water, all to be lighted by hidden electric bulbs. The fountain will cost \$3,000, and will it is hoped be completed by July 4.

A PATENT was issued recently for a "motor-driven car for use in warfare," which, if it is ever built, will be a fearfully destructive engine of devastation. It is nothing more than a battleship on wheels, or an armored automobile full of guns and other terrifying weapons, and also adapted to be so charged with electricity that rash storming parties attempting to board it will instantly be electrocuted.

F. A. Ross, superintendent of the local street railway system of Sacramento, Cal., is trying a new portable electric headlight. The light, instead of being placed over the motorman's head is inserted in a slot on the front end of the car and below the motorman's face instead of above. At the end of a run the light is lifted from the slot, carried around and inserted in the slot at the other end. It is simplicity itself, and in case the electric bulb burns out it can be replaced in a few seconds. The reflector is composed of burnished aluminum and lights up the track for fully a block.

FIRE-ALARM boxes in the public schools of Chicago are strongly advocated by City Electrician Ellicott, who says that it may yet be a choice between spending \$15,000 for such boxes and having a number of children burned to death. He has told President Graham Harris of the Board of Education what he thinks on the matter, and Mr. Harris is of the opinion that the alarms are necessary.

The first shipment of electric automobiles to the Mexican Electric Vehicle Company was recently made from New York. The Mexican company is said to be a sub-company of the Electric Vehicle Company. They are to operate a system of public cabs and omnibuses in Mexico City under concession granted to Mr. Charles L. Seegar. Subsequent shipments will be larger, and similar concessions may be procured in other Spanish-American countries where the cities may permit the traffic of such vehicles.

THE mills along the Battenkill have begun to derive benefit from the electric road from Greenwich to Schuylerville, N. Y., in the transfer of freight. The Boston Manufacturing Company, the Bennington Falls Pulp Company and the Washington Pulp and Paper Company of Middle Falls, have discontinued the use of teams in hauling freight between their mills and the station of the Greenwich and Johnsonville Railroad Company. The freight is now transferred by the use of the new electrical locomotive which is attached to the freight The goods are thus delivered at the cars. mills in the original cars in which they are received.

Toledo, O., is to have an electric tower. Eight electric lights at a height of 234 feet from the ground will form the most prominent object in the night landscape when approaching the city. The waterworks board has determined to place lights on a framework raised 14 feet above the present waterworks tower. The tower is octagonal in shape and one light will be placed for each side. In addition to the light thrown over the park surrounding the waterworks station, where it has been badly needed, and the light distributed over the surrounding portion of Upper Broadway, it is believed that the electric topped tower will be something of an advertisement and improvement.

A PATENT has recently been granted in this country on an electrical divining rod. According to the Chicago "Record" the device consists of a bell, an ordinary battery, the wires from which are attached to two stakes, presum ably of metal. The idea is that when the stakes are driven into the ground if there is a body of ore present the circuit will be completed and a bell will ring. Springs of water and subterranean streams, it is claimed, can be located in the same way.

A NUMBER of naphtha launch owners of Oshkosk, Wis., are installing electric motive power instead of naphtha, and the coming boating season promises several of the modern style of boats.

HERR JOH. HARDEN publishes in the "Elektrotechnische Zeitschrift of April 5th an account of some experiments to ascertain the precise action that takes place when a coherer is under the influence of electric waves. He employed, according to the London "Electrician," a coherer consisting merely of two steel points, and observed it through a microscope. When at a distance of 0.3 mm., sparks passed between them while the neighboring oscillator was in operation; but no current flowed through the battery and galvanometer circuit, which evidently remained interrupted by the coherer. It was not until the points were approached to within 0.006 mm. of one another that a deflection (corresponding to 150 milliamperes) was obtained. With this distance between the points, as soon as the spark occurred, a dark bridge was seen to have formed across the gap. This could be clearly seen with a microscope magnifying 300 times and against a background of white paper. As soon as this bridge appeared the sparking ceased. The bridge remained and the deflection of the galvanometer continued practically constant, until the coherer was shaken.

That Africa is no longer the Dark Continent is proved by the news that an automobile service has been started between the Senegal and the Niger. The automobiles are said to be of Parisian make and are run by Frenchmen.

M. C. CLARK, who has interested himself in bringing off a race between motor vehicles during convention week in Kansas City, Mo., for the benefit of Convention Hall, has received a large number of letters from automobile and motor cycle manufacturers offering to have vehicles ready for the occasion. Mr. Clark's plan is to have a race, probably on the driving club's track, between all sorts of horseless vehicles

The General Carriage Company of this city recently purchased the old 6th avenue car stables, running from 43d to 44th street for a factory site. The site has a frontage of 200 feet on 6th avenue and extends toward 5th avenue 240 feet. The 6th avenue front will be used as a receiving station and other parts for storage and manufacturing purposes.

A RESIDENT of Helsingfors, Russia, is evidently endeavoring to make fishing easy. He has just taken out a patent in this country on a device which is described as follows: "An apparatus for facilitating the capture of fish? by killing or stunning them by means of an electric shock, consisting of an electric induction-coil whose primary winding is in circuit, through a switch normally open, with a battery or other source of electric energy, and whose secondary winding is connected on the one hand with the fish-hook through an insulated conductor in one with the fishing-line, and on the other hand with the water through a conductor immersed therein, so that on closing the switch an electric current generated by induction in the secondary winding of the coil will pass thence through the insulated conductor, the fish-hook, the body of any fish which may have seized said hook, the water, and the immersed conductor back to said secondary winding." We think that there will be little demand for this invention, at least in this country by true lovers of the sport, as it would be too much like hooking and drawing in inanimate bodies, and would do away with the excitement of "playing" a fish.

## ANNUAL MEETING OF THE GENERAL ELECTRIC COMPANY.

(Special dispatch to ELECTRICITY.)

SCHENECTADY, N. Y., May 8, 1900. The annual stockholders' meeting of the General Electric Company was held here this afternoon. About the only business transacted was the election of the following Board of

Directors for the ensuing year:
Gordon Abbott. Boston.

Gordon Abbott, Boston.
Oliver Ames, Boston.
C. A. Coffin, New York.
Thomas Jefferson Coolidge, Jr., Boston.
Thomas .A Edison, Orange, N. J.
George P. Gardner, Boston.
Eugene Griffin, New York.
Henry L. Higginson, Boston.
J. Pierpont Morgan, New York.
J. P. Ord, Schenectady.
Robert Treat Paine, 2d, Boston.
George Foster Peabody, New York.
Charles Steele, New York.

## Meeting of the American Society of Mechanical Engineers.

The American Society of Mechanical Engineers will hold its 41st meeting in Cincinnati from May 15 to 18. The headquarters of the Society will be the Grand Hotel. During the Convention the following papers will be read:

Geo. I. Rockwood. "On the Value of a Horse Power; "H. T. Yaryan, "Hot Water Heating from a Central Station;" W. S. Aldrich, "Systems of Efficiency of Electric Transmission in Factories and Mills;" J. J. Guest, "Design of Speed Cones;" Robert H. Thurston, "Multiple Cylinder Engines;" Wm. T. Magruder, "The Gas Engine Hot-Tube as an Ignition Timing Device;" N. O. Goldsmith, "Water Softening Plant of the Lorain Steel Company; "M. P. Higgins, "Education of Machinists, Foremen and Mechanical Engineers;" Arthur Herschmann, "The Automobile Wagon for Heavy Duty;" M. E. Cooley, "A Test of a Fifteen Million High Duty Pumping Engine at Grand Rapids, Mich.;" W. F. M. Goss, "Tests of the Snow Pumping Engine at the Riverside Station of the Indianapolis Water Company;" B. C. Ball, "Cylinder Proportions for Compound and Triple Expansion Engines." Topical discussions: "What Does it Cost to Run Trains at High Speed?" "Protection of Pen-stocks from Corrosion."

#### Proposals Invited.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until May 15 for furnishing the Boston Navy Yard with one generating set. Specifications and blank forms of proposals will be furnished upon application to the Navy Pay Office at Boston or to the Bureau at Washington.

Sealed proposals are being invited until May 15 for furnishing and installing one electrical power plant in the Boston Navy Yard. Blank proposals will be furnished intending bidders upon application to the Navy Pay Office at Boston or to the Bureau of Supplies and Accounts, Washington, D. C.

#### THE PARIS EXPOSITION.

BY CHARLES LEMOINE.

(Special Correspondence of ELECTRICITY.)

The Paris Exposition consists of two sections lying across the Seine; these are joined by a series of buildings extending along the river on both banks. The section known as that of the Champs Elysées has on one side of the river the two principal buildings of the Exposition, the large and smaller palaces, one on each side of a fine avenue, which is continued across the river by a new bridge of handsome construction, called the Pont Alexandre III; from here the avenue continues, and is bordered on either side by a number of fine buildings whose facades are in staff and richly ornamented. Commencing at the bridge and extending along the left bank of the Seine is the series of national buildings, each presenting letter boxes, etc. The different floors will be occupied by State and National reception rooms and offices, with a lunch room in the rear. The pavilion will be surrounded on the outside by a series of incandescent lamps outlining the building, and will present a brilliant appearance at night. Farther on is the Army and Marine Building and on the opposite side the Horticultural Building that is devoted to the various congresses of the Exposition. Here the Electrical Congress will be held from the 18-25th of August. Farther along is found the Champ de Mars section, covering a large extent of ground. The central gardens are surrounded on three sides by a series of buildings, forming a continuous facade. The third side is formed by the Electrical Palace, a view of which will be seen in Fig. 1.

In front of the Electrical Palace is the electric fountain, which promises to be one of the

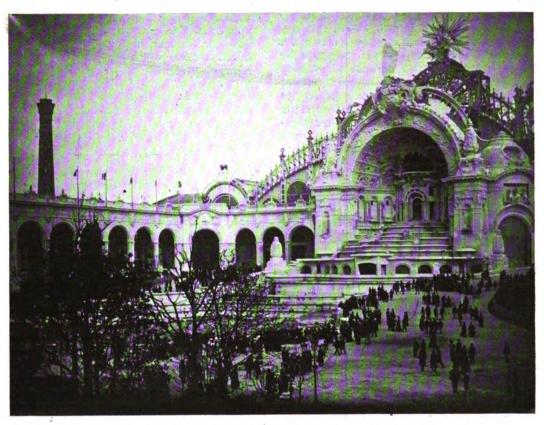

FIG. 1.—VIEW OF ELECTRICAL PALACE AND FOUNTAIN.

a different style of architecture, forming a unique and picturesque collection. The United States pavilion is one of the most important of the series, being situated between those of Turkey and Austria. It is built of white staff, being a square structure, surmounted by a dome of considerable dimensions ornamented with gold palm-branches. At the top is a gilded eagle. In front and overlooking the Seine is a portico in the classic style, having an arch on each of its three sides; under the outer arch is a colossal equestrian statue of George Washington in white staff. The roof of the portico is hemispherical and contains a handsome fresco of the Goddess of Liberty with the eagle and flag. Back of the portico an arched doorway leads into the main building and over this is another fresco representing the national industries and products. portico is surmounted by a quadriga with the Goddess of Liberty. The central portion of the building under the dome is of octagonal form, and is surrounded by galleries corresponding to the three upper stories. On the first floor is a model American post-office with attractive features of the Exposition. This consists of a large central arch, bordered on each side by an arcade containing an upper and lower gallery; these are joined on each side by the arcades which extend along the two sides of the grounds, as will be seen on the left. The fountain thus forms the central point at the extreme end of the grounds. Under the main arch is a large niche having an opening in the form of a grotto, and from the basin will fall a wide sheet of water into the series of basins seen below. On the ground level is a large basin extending out from the fountain for a considerable distance, from this will rise various sprays and jets of water, and the whole will be brilliantly illuminated from below by arc lamps giving different colors. The main fall will also be lighted by openings in the niche. The fountain is of white staff and is richly ornamented with reliefs and sculptured groups. At night it will no doubt give a striking effect. Back of the fountain rises the facade of the Electrical Palace, having a series of large windows in front, and surmounted by an ornamental crest. This is constructed in

metal-work and ceramics. At the top is a figure representing the genius of electricity drawn in a car by chimeras. Below is a tablet bearing the date 1900; behind the group is a large open-work star of gilded metal. The appearance of the facade is very handsome; it carries at the top a series of globes for are and incandescent lamps and will also be brilliantly lighted up from the interior.

The inside arrangement of the Electrical Palace will be seen in Fig. 2, which has been taken from the extreme end of the building. It is divided into three parts, the second floor extending across the middle part, as will be noticed in the background; this is reached by a wide staircase on each side. The central portion has on each side a large dynamo building, seen in the front of the figure, occupied by the machines for the lighting and power necessary for the Exposition. The building shown in front is occupied by the engines and dynamos of French construction, and a similar building in the rear contains those of foreign make. These dynamos and engines present a collection of widely varying types, and are arranged along each side of a wide central passage. In each building is a 25-ton electric crane. Each of the two dynamo buildings has back of it a boiler room which contains a series of boilers of different makes arranged on each side of a central passage. The boilers face to the outside, leaving the middle space free for the passage of coal cars. Under each range of boilers is an underground conduit which conducts the products of combustion from the furnaces to an immense smoke stack, which is 230 feet high and has 14 feet interior diameter. It will be seen on the left in Fig. 1. On the upper floor of the Electrical Palace are placed the different exhibits, and the long galleries extending along the dynamo buildings will also be used for this purpose.

To provide the necessary light and power will require about 20,000 kilowatts. In each of the dynamo buildings are about twenty directconnected units, giving 10,000 kilowatts. The engines have a total of 36,000 horse-power. The dynamos are in all cases mounted on the shafts of the engines, and are about equally divided between continuous and alternate current. The generators have a total capacity of 8,000 kilowatts, and the alternators give 1,270 kilowatts single phase; 500 diphase and 10,000 triphase. The power for the various exhibits, etc., will be supplied mainly by diphase and triphase motors. For the lighting of the buildings and grounds will be used 1,300 directcurrent arcs and 1,560 alternating, making 2,860 arc lamps in all, besides 10,000 incandescent lamps.

In Fig. 3 will be seen one of the large directconnected units in the German section. The engine has been built by Borsig, of Berlin, and is rated at 2,000 horse-power. It carries a Siemens & Halske alternator of 1,200 kilowatts. The field poles are mounted upon the flywheel, and the armature winding consists of a series of copper bars placed in slots in the interior of the crown. Next to this is another upright engine of German make, having on one side a Schuckert alternator of 500 kilowatts of somewhat the same design, and on the other a 14-pole direct-current machine of 400 kilowatts. Opposite these are two large units, the first being an upright triple-expansion engine, carrying on one side a Lahmeyer alternator of 500 kilowatts, and on the other a 12-pole generator of 350 kilowatts. It is followed by a Helios alternator of 1,000 kilowatts

with horizontal engine of the Augsburg type. The Belgian machines are represented by a Kolhen alternator of 500 kilowatts, and two others of 600 and 500 kilowatts. The Austrian machines include two triphase alternators of Ganz & Co.'s make, of 500 and 650 kilowatts, and one of Siemens & Halske, of Vienna, a 900 kilowatt generator. The Swiss machines present an interesting collection.

transmission. In the other dynamo building is a crane of the same capacity. It takes the form of an immense arch, running upon rollers at the sides of the building. The arch is braced near the top by the horizontal crossbeam on which the carriage travels, this having direct-current motors for propulsion and lifting. This crane is of German make, being constructed by Carl Flohr, of Berlin.

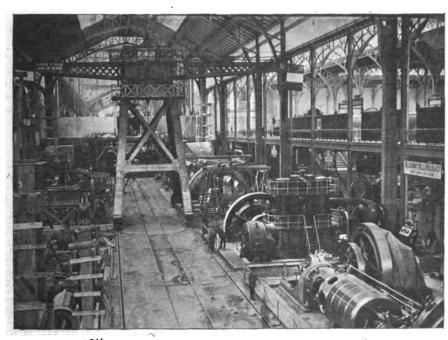

Fig. 2.—Dynamo Room, French Section.

Among these are two Oerlikon alternators of 250 and 500 kilowatts. Great Britain has three direct-current machines, the largest being that of Siemens Brothers of 1,300 kilowatts, with a Willans engine. Italy and Holland are also represented by a number of machines.

The French section shows a number of large machines of different types. Among these may be mentioned a Fines-Lille triphase alternator of 600 kilowatts, a Farcot alternator of 450 kilowatts, and the large alternator built by Schneider & Co. of Creusot, giving 800 kilowatts, coupled to a Dujardin engine. Paris branch of the Thomson-Houston Company has a large 675 kilowatt machine driven by an upright engine of Cail & Co.'s make. The Maison Breguet has a 500 kilowatt alternator, and next to this are two generators of 250 and 75 kilowatts built by the Postel Vinay Company on the Thomson-Houston system. An interesting group consists of a Laval steam turbine running at high speed; to this, by means of reduction gearing, are coupled two direct-current machines of the Breguet type. To supply current for the two large cranes, and for the lighting necessary for the erection of the machines at night, a gas engine plant has been placed in one of the dynamo buildings, consisting of two 60 horse power gas engines of the Charon make, driving by belt two small generators of 70 kilowatts each.

A large 25-ton crane of French construction is shown in Fig. 2. It runs upon a wide track formed by two rails side by side with a rack between; a pinion carried upon the crane gives the necessary movement, this being operated by an intermediate shaft passing from a motor placed above. On top of the main tower is a circular platform upon which a series of rollers is placed, permitting the horizontal beam to revolve, giving the crane a radius of 35 feet. The carriage is operated from motors placed in the center by chain

As to the exhibits, these are now being rapidly installed, and there is no doubt that in a few weeks the whole second floor of the Electrical Palace will present a finished appearance. The United States has a fine pavilion, which occupies a considerable space. It is

marble bust of the Emperor Francis Joseph. Here are seen a number of interesting exhibits, such as telephones, telegraph instruments and Ganz & Co. has an extensive collection of triphase motors and transformers, and Siemens & Halske show a series of small directcurrent motors, fuse-blocks, porcelain insulators and switches. A model of the underground conduit system of Buda-Pesth is also shown, with miniature electric cars. The Pollak accumulator is represented by a number of types of cells and plates. In the German section the Allgemeine Gesellschaft are erecting a large pavilion of repoussé copper and stained glass, and Siemens & Halske has a smaller one of carved wood. Among the French exhibits which are now in place, that of the Dussaud loud speaking telephone and phonograph attracts considerable attention. An interesting collection of bare wires and cables is shown by Lazare Weiller, of Havre. The Gaiffe Co. has an extensive exhibit of electro-medical instruments of high-tension apparatus. The galvanoplastic exhibit of Christople & Co. contains a number of objects of art, bronzes, etc., reproduced by this process. The Leclanché Co. has a collection of batteries, and the St. Gobain glass works shows a new form of white glass which replaces marble for switchboard panels and instrument bases. The Transportation Building will contain a number of electric cars and automobiles; a part of this section will be located at an extensive annex to the Exposition, which has been arranged at Vincennes Park, in the suburbs of the city. Here will be installed a number of exhibits containing cars, trucks with motors and automobiles, and American firms will be well represented. For the automobiles special arrangements have been provided and a large race-track has been laid out, besides all the necessary accommoda-

ber of exhibits in place. In contains a life-size

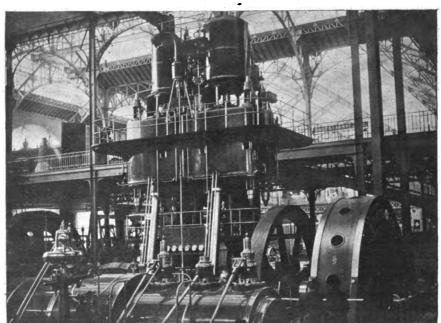

Fig. 3.—Borsig Engine. Siemens & Halske Alternator.

built of white staff, consisting of a colonnade in the Corinthian style, with arched doorways. It contains a series of reception rooms, and here will be seen an interesting exhibit of historic electrical apparatus, arc and incandescent lamps, models of dynamos, measuring instruments, etc. Next to it is a German pavilion of novel construction, built also of staff, and ornamented with metal-work designs.

The Austrian section has the greatest num-

tions for the automobiles of all systems. A charging station is provided, with facilities for repairs, etc. The Paris Automobile Club will conduct an extensive series of tests and races, and will award diplomas to the successful competitors. This promises to be one of the interesting features of the Exposition.

The Exposition is to be well supplied in the way of communication by telegraph and telephone. Several telegraph offices have been in-

stalled, and throughout the grounds are a number of public telephone boxes, by means of which communication may be made to the city circuit. A convenient system has been adopted by which the message is taken down by an attendant at the receiving station and delivered to any address. The grounds will be well lighted by arc and incandescent lamps. For the arc lamps, a number of handsome poles have been erected. Some of these have a cast-box at the base to contain a transformer; they are fed by the high-tension system, direct or alternating. On the Alexandre III Bridge are a series of artistic bronze candelabra, each having four globes of moulded glass containing four incandescent lamps. At each end of the bridge are two very long and handsome candelabra of antique bronze, with a group of several figures supporting the base.

#### GAS VS. ELECTRICITY FOR LIGHTING PURPOSES.

BY J. R. CULLINANE.

I assume the above subject was assigned to me for some good reason, but I wish to assure you that I have had no experience in selling either gas or electricity in competition; on the contrary, nearly my whole experience has been in selling both articles at the same time to the same class of patrons. I will endeavor to tell you something about selling gas and electricity from this standpoint.

It is a hard matter to adjust the prices of both articles on an equal basis, especially is this so in a small city where there is a demand for flat rates. Flat rates are a nuisance where the company using them is also selling gas and electricity through a meter service. I will add flat rates are very unsatisfactory. In early days I asked a promoter of electrical plants (who in those days usually represented some large manufacturer) why he asserted a six andle power incandescent lamp sold at a certain price was all we could get for it, he replied that we must meet the prices at which we were then selling gas, and he added that the demand for electricity had to be met irrespective of its cost. Indeed, he was uncertain as to its cost. Of course we all know more now as to its cost than we did then, but I have often observed that a great many of the plants in Texas established their prices in the same way, and probably for the same reason. The fair and equitable way to sell electricity is through meters. In the gas business the meter is used exclusively; the manager of a gas company can tell you his leakage, his yield and exactly what it costs him per thousand cubic feet to make or deliver his gas; hence he can deliver his product on a basis through meters so that every foot of gas sold brings in pro rata profit.

In the electrical business we should do the ame thing. We should know our leakage and what it costs to generate and deliver the current per thousand watts. To do this we should measure the current as we send it out through large station meters, and then sell it exclusively through meters to our customers. All flat rates should be avoided. The investment in meters will be large, but I think the ability of the plants to sell to a large number of customers, and thus save additional machinery, will fully repay for the investment in meters. The early prices of electricity were established to

compete with the then existing prices of gas. Gas at \$2 per thousand cubic feet was figured out equal to current at 20 cents per thousand watts, or one cent per ampere hour, and the flat rates were adjusted accordingly.

Assuming the prices of gas and electricity adjusted on an equitable basis, we will pass to the next problem, that of handling the "dear public." If we find any of our patrons with any ideas as to the kind of light they desire to use we encourage them in their choice. We always endeavor to let them say what kind of light they shall use without any influence from ourselves.

Necessarily, the dual interests of a company selling gas and electricity for lighting purposes clash; but we find many places in our line of customers where only gas will serve the purpose, and other places where only electricity will answer. We always take advantage of these opportunities to keep the interests from encroaching on each other and at the same time increase the growth of each business.

In the lighting business exclusively each kind of light has its particularly good points. In the management of a company selling gas and electricity we find other territories besides the lighting business in which to sell our products, and in these we find the dual interests do not clash.

Our sales of gas for cooking purposes in no way affect or decrease our sales of electricity; to a dual company this is a wide field; forty per cent, of our gas is sold to this class of business. and the percentage is always growing. I can remember only a few years back when gas companies had only a small part of their output going through gas stoves. We have another large field for the sale of gas through the medium of the instantaneous water heater This apparatus has reached a very high state of mechanical perfection, and the demand for them is growing. They are very satisfactory to the patrons of a gas company, and as they are very liberal in the consumption of gas, are also very satisfactory to the gas companies themselves.

By pushing the sale of gas in these two fields we do nothing to hurt our electrical business. The advent of the Welsbach burner brought joy to the gas man, but the Welsbach burner is in direct competition with electricity, and it is not my purpose here to discuss that side of the question.

As I stated above, I will endeavor to show you there are spots in the dual business that are not necessarily competitive.

I have stated a few of the fields in the gas business that can be pushed without hurting the electrical business. On the other hand, in the field of electricity we have a class of business that can be pushed that will not hurt the sales of gas. I have reference to the sale of current for use in small motors and fans. This is a very wide field and a very profitable one. The prices usually paid for power current are more remunerative than those paid for lighting purposes.

Nearly any electrical company can operate a power circuit successfully and profitably. The number of places that will use motors and fans is astonishing. To a company doing a dual business this class of business is of great assistance. Another field for selling current is in the way of advertising. You find many customers who spend money for electricity in different ways to advertise their business. Some will use arc lights and incandescent lights illuminating the outside of their stores and show windows; others working electrical devices and signs to attract attention to their stores. This is not in competition with the sales of gas, but brings in quite nice returns.

Further, by combining the business, if you can control the territory and avoid the awful prices usual where competitive plants exist, there is a hope for success. I am frank to say I often wonder how some of the competitive plants exist and sell their products at their prices. I think good management should mean good prices, and I don't understand how some of these competing plants can pay their actual operating expenses, to say nothing of fixed charges, interest, depreciation and repairs. I assume they know their business and are pleased with the results. Any way there is one set of people happy where there is competition in the lighting business; that is, my friends, the "dear public."

#### THE STEAM AUTOMOBILE.\*

BY J. A. KINGMAN.

The first steam automobile was built in France in 1769 by Nicolas Joseph Cugnot, a French military engineer, after his retirement from the army. He constructed two carriages, the first one of which was unsuccessful, either on account of the small size of the boiler or of inefficient feed pumps. The carriage could not run for more than a short distance without stopping to get up steam. It possessed considerable power, however, and once actually broke down a stone wall in one of its erratic movements. A second machine was constructed, which consisted of a three wheel vehicle, the boiler being placed in front and the fore wheel driven by a double-cylinder engine. This original carriage, together with an excellent model of the same, is now preserved in the Conservatoire des Arts and Motiers. In England Watt was apparently to much engrossed with other work to pay much attention to steam carriages, although he applied for a patent on a steam carriage in 1781. There is, however, no record of his having taken up the matter further. In later years Watt was opposed to steam carriages and would not let them pass his residence.

The first carriage built with the intention of using on common roads was that of Julius Griffith, built in 1821. The piping, pumps, engine, machinery, etc., were of excellent design and fine construction. The boiler, however, was so designed that it made the regular generation of steam impossible, as water was expelled from the tubes and could not be introduced. Sir Goldsworthy Gurney started his experiments in 1825 and built steam coaches until 1832. Gurney's steam coaches or drags were fitted with his patent water tube boiler and his slide valve engines. A feature of his boiler was a system of chambers or separators to prevent priming. Steam could be gotten up in about five minutes.

Walter Hancock was the most successful builder of steam carriages in England at this date. He built ten carriages, nine of them large omnibuses, and the last two carriages were successful in every way. Hancock began working on steam carriages in 1825 and continued his labors until 1840. The boiler employed by Hancock consisted of a series of chambers arranged vertically. The engine had two cylinders and was placed vertically, the circular motion of the crank-shaft being communicated to the

<sup>\*</sup>A paper read at the 204th meeting of the New York Electrical Society, New York City, March 22, 1900.

<sup>\*</sup> A paper read at the annual meeting of the Southwestern Gas, Electric and Street Railway Association, Waco, Texas, April 13, 1930,

rear axle by a chain. It is stated that Hancock was the first steam carriage builder to run his carriages in the streets of London, where they were operated without noise, smoke or appearance of steam. Hancock's carriage ran between London and Paddington for five months. In 1840 the subject of steam locomotion in England on common roads ceased to be a matter of public interest, and from this time on we do not find any marked development otherwise than that of the traction engine. The steam automobile in America has resulted in one type only, viz., that of the light pleasure carriage. Particular attention may be called to the Overman-Crouch, Whitney and Thompson vehicles, together with the locomobile designed by F. E. and F. O. Stanley. The Overman steam carriage is supplied with a steam boiler and a slide valve engine. Steam is exhausted into the hollow tubes of the running gear and passes into the atmosphere through small holes drilled in the front axle. The level of the water in the boiler is kept at the same height by means of an automatic controller. The motor is set to run at a constant speed, and different carriage speeds are obtained by clutches. The Crouch steam carriage employed super-heated steam and has proven a very good steam carriage, but considerable difficulty is experienced from the fact that the engine shaft is set rather high and the chain is apt to break when the carriage is traveling over a rough road. The Whitney steam carriage has undergone considerable change since George E. Whitney built his first vehicle. All these carriages mentioned are of the same general type, using a small water tube or fire tube boiler, which is fired by gasoline, and the steam used in a small steam motor of simple design.

In the "locomobile" steam carriage gasoline is used as a fuel and is stored in a copper tank holding three and one-quarter gallons: the storage tank is placed under the foot-board and the fuel is forced by compressed air through the boiler where it is vaporized to the burner and ignited. Power is communicated by means of the chain from the engine sprocket to the larger sprocket on the rear axle. A strut of variable length keeps the engine shaft parallel to and always the same distance from the rear axle. There are twelve teeth on the engine sprocket and thirty on the rear axle sprocket, consequently it takes two and onehalf revolutions of the engine to produce one revolution of the wheels. A steam pressure of 160 pounds is carried and a pop safety valve blows off at 225 pounds pressure. Exhaust steam is muffled in a copper tank and passes through a flue in the water tank to the atmosphere. The burner is of extremely novel design, and one of the most interesting features of the carriage. It consists of two plates connected by 114 short copper tubes and is encased in a short metal cylinder. The upper plate is pierced with 2,280 capillary holes; twenty of these holes surround the opening made by each copper tube. The gasoline having been vaporized, by passing through two of the boiler flues, is forced by compressed air from an atomizing nozzle into a bell-mouthed mixing tube. The proper mixture of air and vapor having been obtained, combustion takes place above the upper plate. The combustion chamber is about three inches deep. The fire is automatically regulated. When the steam pressure reaches 160 pounds a diaphragm presses against a spring, the movement of which closes a needle valve, thus reducing the supply of fuel. This burner is placed directly below the boiler and gives a blue flame of perfect combustion, and is operated without odor or noise. Steam pressure may be obtained within less than ten minutes from the time of lighting the fire. In some cases it takes as short a time as four minutes to get sufficient steam to start.

Several of the best scientists of this country have made the unqualified statement that steam is the best power for motor carriages. Steam is our best known power and the one most used. A number of the most important advantages of steam for motor carriages may be briefly stated as follows: 1. Great power may be stored in small space. 2. An entire absence of objectionable features may be obtained. 3. Great power. 4. Elasticity of steam. This is, perhaps, the most important advantage and must not be undervalued. The reserve force in the boiler makes it possible to develop a great power for a short time, thus the carriage may be propelled through a very bad piece of road or up an unusually steep grade. 5. Speed. The speed is only limited by the position of the road and may be varied as desired. The particular advantage of throttling the steam is that any speed may be obtained from 0 to the maximum. This makes it very convenient in crowded streets.

#### A DEVICE FOR PREVENTING THE DE-STRUCTION OF IRON PIPES BY ELECTROLYSIS.

It is only necessary to listen to the complaints emanating from various communities to get some idea of the great amount of damage that is being done to underground pipes by electrolysis. This question appears to have developed within two or three years a comparatively new feature and one which it seems is of no little importance. We refer to the resistance of joints in water and gas mains.

Were it not for this fact there would be a chance of dealing with the problem through some of the methods proposed, but as it is practically impossible to electrically bond the joints of the piping system now underground of any city, for reasons that are obvious, it would seem that relief must come from the trolley roads finding some other method than the ground return before a complete remedy can be looked for.

It may be well just here to turn our attention to new pipes that are constantly being laid, and see if at least there may not be some method of protecting them.

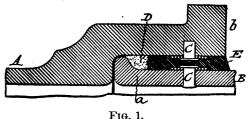

In looking over the patent records of the United States for the past few years, which is generally a good indication of what engineers and inventors are doing, we find only three or four patents that bear on this particular case. All of them, with one exception, which we will refer to later, are devices for bonding electrically the joints of pipes from the *outside* of the main, in a similar manner as the joints of rails are now bonded.

It would seem that such devices could not be depended upon for continual electrical contact any more than the present rail bonds, owing to the corrosive effect of constant moist earth in which they are buried, besides the difficulty and expense of applying the same.

A patent above referred to, however, was issued on April 3 to Mr. A. A. Knudson of this city, who, it is well known, has devoted much time and work to this subject, which for novelty, cheapness and ease of application is well worthy of attention.

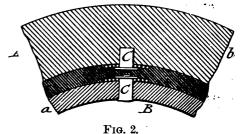

The object of the invention is, first, to prevent the shunting of stray electric currents around pipe joints, and second, to provide a method of electrically bonding pipes that ensures a permanent connection and one that will not deteriorate in time through oxidation. Figs. 1 and 2 are sections of a packet joint and illustrate how the device is applied. At the factory where the pipe is made or upon the ground before the pipe is laid the pipe sections A and B are each provided with a non-oxidizable electric contact C, shown in detail in Figs. 3, 4 and 5.

In making use of this device the pipe is laid

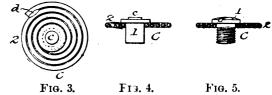

In the ordinary manner except that care should be taken to see that the contacts are clean. The jute stuffing, D, is then introduced and the joint caulked with lead.

As described in the patent the spigot end and the bell end of each of the pipe sections A and B are provided, respectively, with external and internal contacts C (Figs. 3, 4 and 5), so arranged that they may be brought into coincidence with each other, as in Figs. 1 and 2, and electrically connected with each other

by the lead packing E. Two pairs to each pipe joint are represented; but one pair is considered sufficient in most cases, and in some cases a single contact at each joint may suffice, especially if the opposing surface be scraped bright immediately before pouring the lead. The form of contact represented in these figures comprises a rivet-shaped attaching portion 1, having its head provided with a central boss c to protect the remainder of its surface, which is intended to receive the patentdate, a license-number, or the like. In applying a contact to the spigot end of a pipe-section the socket to receive such attaching portion 1 is conveniently drilled through, and the attaching portion is then riveted in place, as

represented in Figs. 1, 2 and 6. Within the bell the attaching portion 1 is driven tightly into a drilled socket of sufficient depti.. The protruding portion 2 is formed by a normally-flat spiral washer of wire, having the outer coils united by solder, as at d, Fig. 3, to preserve the washer shape. A washer of this description is readily conformed by bending to a convex surface and conforms itself to one that is concave, and by admitting the lead be-

tween its coils affords a large contact area within a small space. The fastenings d of two contacts may, moreover, be readily broken, if desired, in making a joint, and the wires may then be uncoiled and twisted together to render the hard-metal connection continuous. Contacts of such description may obviously be used for bonding riveted steel pipes and for other purposes.

The contacts C in common are preferably of tin or of tinned copper, because sufficiently inexpensive and at the same time non-oxidizable, and adapted to form a perfect electrical contact with iron and with molten lead; but any metal that is a fairly good conductor of electricity may be used. They are applied in all cases after the pipe has received its asphalt coating, so as not to be covered thereby.

That the Knudson pipe bond accomplishes that for which it was intended is forcibly demonstrated by a number of tests that were recently made by the well-known electrical

Fig. 6.

engineer, Mr. Elmer G. Willyoung, for Mr. Francis Forbes. The object of the tests was to ascertain the electrical resistance of joints bonded and not bonded. The pipes were 8 inches in diameter. Each line consisted of four lengths, thus permitting readings to be taken at three joints. The tests were made by the well-known "Fall of Potential" method, the two lines of pipe being joined in series with a two-cell storage battery and a Weston D. C. ammeter. The drop of Emf. was obtained by a Weston millivoltmeter. The result of the tests expressed in ohms is as follows,

Joint not bonded.	Bonded.
.005943	.000107
.009749	.000103
.003483	.000080

The results obtained are most striking, and show that where the bond is employed the "joint" resistance is many times less than in the case of the plain joint, which would effectually prevent any stray electric current that might happen to seek a line of pipe from being shunted around the joints.

It would seem from this that the inventor's idea is, that as we are bound to have more or less trolley current flowing through water and gas mains, we can at least so bond a joint that it will stop the shunting effect. Were proper returns provided for a railway circuit so

as to keep down the flow of current to and from such mains to a minimum, Mr. Knudson's invention would seem an important step in the right direction, at least so far as new pipes are concerned.

#### OPERATION AND MAINTENANCE OF STREET RAILWAYS.\*

BY H. F. M'GREGOR.

I hardly know what is expected of me by the association. The subject, "The Operation and Maintenance of Street Railways," affords scope enough to write a book, but consideration for my hearers and my own inclination will limit me to a few observations growing out of the experience that I have had in such matters as I feel may be useful to others, or as may invite discussion, with some comments and criticisms on current conditions added thereto.

The last decade has witnessed revolution and annihilation; the nightmare of the succession being about the only reminder of the motive power of the past. Invention has crowded invention. The electrical apparatus of yesterday is a back number to-day. The standard of to-day, if we dare yet talk of standards, is likely to be obsolete to-morrow. The procession has moved rapidly, and but few of us have had properties financially able to keep pace with it. Our experience, like our machinery, is obsolete; it was expensive, but is perhaps worth all it cost, and whether we were willing victims or forced, there was no choice; we could not stand still. Investors in street railways and other electrical plants have contributed large sums to the march of events, and those that come after us will consider it money well spent, and those that went through the transition find themselves cautious and self-reliant, two essentials to-day in the successful management of electrical properties. There was something to warm the cockles of the heart in the motive power of old that is lacking in the modern method. Perhaps the kinship of flesh and blood, or the theory that blood is thicker than water, for looking backward, is there a street railway man who can picture that he was at one time or another a brother to the sire of the lamented but not forgotten mule that shared our burdens?

I should have profited by the knowledge of the habit of our neighbor across the border, and have said, in answer to the suggestion of your committee, Manana, for "to-morrow." I am hoping for several standards in the construction, operation and maintenance of street railways adapted to all classes and conditions. Systematic and thorough work in this direction is what I believe is needed most by railway interests, commencing with franchises, proper municipal demands, standards for material and equipment for cities of different classes. Everything now is based on what is accomplished in large rcities, municipal exactions are the same, and the public mind is educated by object lessons from cities glutted with traffic where the problem is how to handle it, and not how to create business, where the horn of plenty exists, and is not an iridescent dream.

At the national convention I ventured to remark that the trend of the discussion was toward conditions existing in but few cities,

and inapplicable to the wants of most of the members, and suggested a division that would profit the smaller interests, I see from the published programme that at the next national convention we are to have a paper on construction, operation, and maintenance of roads that operate twenty cars or less; this is a step in the right direction.

The improvement demands no spoliation by the courts; municipalities and legislatures menace the very existence of street railways in cities under 50,000 inhabitants, or cripple them so they are unable to maintain the public service as they desire or should do. This should be remedied by proper education of the public mind, and no one can better do it than the street railway people and allied interests, working out with mathematical precision the results that can be obtained under given conditions. I believe we now have had sufficient experience to do so, and it is only a matter of compiling same, and getting it properly before the people, as an aid to the successful development of improved city and suburban facilities, and as a convincing answer to the craze for municipal ownership and social-

In the operation of street railways I recommend the belt system as being more profitable, covering more territory at the same operating expense; affording greater protection against accidents over a double track-system, and with less delays and annoyance over a switch system.

In cities of the class of Houston we average a car for about every 2,500 inhabitants. In smaller cities it would vary from this number to one for every 5,000 people. With us the travel amounts to one fare daily for less than 20 per cent. of the population. The operation of these cars should have close attention and every effort made to encourage and increase travel. Attractions on lines operated on a business basis are desirable, and free shows are not beneficial; those of a class that should be encouraged cannot be afforded free on a fivecent fare. It is preferable to give people full value for their money in attractions, concerts, etc., say ten cents admission and ten cents for reserved seats. Where the attraction is inexpensive in character the admission charge might include a coupon for refreshments at the privilege stands.

We operate our cars by the usual methods, and have no patent process better than others. Eternal vigilance is the price of success, and if not success, of the privilege of living.

Our headway varies from five to thirty minutes on different lines. On short lines it is desirable to have short headway. Formerly our outside limit was twenty-minute service. but we find half-hour cars earn about the same money on light traffic lines, and that fifteen minute service does not increase the travel but slightly and only to a small percentage of the increased expense of another car. Patrons on long headway lines time themselves until it becomes a habit, and the domestic arrangements at home are systematized accordingly. Twenty dollars per car per day is required for operation and maintenance of a proper standard of excellence, and the profit must come from earnings above that.

For the economical maintenance of a line it should be constructed well in the beginning. The rail should be sixty-pound or heavier; the heavier the better; base of rail not less than five inches in width to prevent cutting into ties. The joints should be cast welded.

<sup>\*</sup>Abstract of paper read at the annual meeting of the Southwestern Gas. Electric & Street Railway Association, Waco, Texas, April 13, 1900.

#### Electric Park in Kansas City.

The Heim Electric Park at the east end of the Heim electric line in Kansas City, Mo., is now nearing completion and will be opened May 27th.

Fifteen acres are being utilized for the park and at night, when the shrubbery is all in place, lighted up by the myriads of vari-colored electric lights, the effect will be fairy-like and dazzling.

The supreme attraction will be the electric fountain, which is to cost \$20,000. This fountain will throw 4,000 gallons of water a minute, sending it over 100 feet in the air.

Underneath the waterfall a stage has been erected twelve feet square, where all kinds of serpentine and skirt dances will be produced while the fountain is playing. This will be the most novel feature about the fountain, and it is believed that there is only one other similar to it in the United States. This is the one at Washington park, Philadelphia, that was built last year.

The floral designs throughout the park will be one of the main features. Several of the flower beds will represent the United States flag, and one the globe. This last is said to be a very delicate piece of work. The globe will first be made out of wood, filled in with four inches of moss and earth. On one side will be reproduced, in flowers, the map of the United States—the other side the Philippine Islands. All these floral effects will be illuminated at night with small electric lights of many colors. In fact, the lighting of the park is to be one of the most brilliant features. The grounds will simply be flooded with electric lights of every description. Experts will have charge of the floral and electrical displays and they have able assistants to second their efforts. In addition to these other features there will be a realistic German village, similiar in every way to the one that delighted so many thousands at Chicago. Inside of this a fully equipped café and dining hall will be put in running order.

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended May 5:

Alexandria, 2 cases, \$340; Antwerp 13 cases, \$1,793; Argentine Republic, 64 cases electric motors, \$4,388; Australia, 13 cases, \$1,792; Bremen, 1 case electric motors, \$18; Bristol, 2 cases, \$125; British West Indies, 62 cases electric motors, \$937; Brussels, 3 cases electric motors, \$62; Central America, 78 cases electric motors, \$199; 2 cases, \$82; Christiania, 1 case, \$93; 1 case electric motors, \$32; Cuba, 20 cases electric motors, \$910; Danish West Indies, 2 cases electric motors, \$26; Genoa, 11 cases, \$6,971; Glasgow, 11 cases, \$1,490; Hamburg, 86 cases electric motors, \$10,978; Havre, 19 cases, \$1,262; 378 cases electric motors, \$10,946; Hayti, 1 case electric motors, \$20; Japan, 70 cases electric motors, \$9,993; Liverpool, 198 cases electric motors, \$20,236; London, 169 cases electric motors, \$6,533; Mexico, 178 cases electric motors, \$8,934; Naples, 61 cases electric motors, \$4,000; Peru, 31 cases electric motors, \$6,649; Riga, 3 cases electric motors, \$716; Southampton, 7 cases electric motors, \$2,894; 48 cases, \$765; St. Petersburg, 1 case electric motors, \$198, Stettin, 60 cases electric motors, \$1,829; Venezuela, 23 cases electric motors, 478; Zurich, 5 cases electric motors, \$315.

#### NATIONAL ELECTRIC LIGHT ASSOCIA-TION CONVENTION.

# The Papers to be Read and Topics Discussed—Plans of the Local Reception Committee—Headquarters at the Auditorium Hotel—Transportation.

The Twenty-Third Convention of the National Electric Light Association will be held at the Auditorium Hotel, Chicago, May 22-24. Papers on the following subjects will be

read and discussed:

"Uniform Accounting," Lieutenant James Blake Cahoon, Syracuse, N. Y.

"Equitable, Uniform and Competitive Rates," Henry L. Doherty, St. Paul, Minn.

"Series Enclosed Alternating Arc Lamps," Prof. William Lispenard Robb, Hartford, Conn.

"Exhaust Steam Heating," Col. F. A. Copeland, Lacross, Wis., and Harry J. Frith, Watseka, Ill.

"Combination Electric Lighting Power and Railway Work," R. S. Feicht, Pittsburg, Pa. "Automobiles as a Source of Revenue to

Central Stations," Elmer A. Sperry, Cleveland. "Central Station Economies," W. L. Abbott, Chicago.

"Alternating Current Generators," H. G. Reist, Schenectady, N. Y.

The topic "Free Wiring" will be introduced and discussed by Mr. Chas, R. Huntley, of Buffalo, N. Y.; Mr. E. L. Bemiss, of New Orleans, La., and Mr. Dudley Farrand, of Newark N. J.

The question of municipal ownership of electric lighting plants will be discussed, and a report will be made regarding the progress of the investigation of municipal plants, and plans formulated for the continuance of this work.

#### ENTERTAINMENT.

The following gentlemen form the Local Reception and Entertainment Commmitte, Louis A. Ferguson, chairman; B. J. Arnold, C. E. Brown, F. E. Donahue, H. R. Hixson, A. O. Kuehmsted, C. A. Munson, J. B. Wallace, F. B. Badt, F. H. Clark, Edward B. Ellicott, Samuel Insull, W. W. Low, Julian Roe, G. S. Whyte, George C. Bailey, Norman Collins, C. E. Gregory, E. B. Kettle, A. D. Lundy, Thomas I. Stacey, J. R. Wiley, Charles T. Boynton C. D. Crandall, Arthur Hartwell, F. W. Kohler, G. H. McKinlock, B. E. Sunny and James Wolf.

This committee has arranged for a general reception at the Auditorium parlors on Monday evening, May 21st; for an automobile ride for the ladies on Tuesday morning, with luncheon at the Washington Park Club; on Wednesday, a shopping tour in the morning and a matinée in the afternoon; on Thursday, the Art Institute and Public Library will be visited in the morning, and a matinée in the afternoon.

The Auditorium Hotel has been selected as the headquarters of the Association. Hotel rates will be as follows. On the American plan, \$4 per day and upward; on the European plan, \$1.50 per day and upward.

#### TRANSPORTATION.

The Trunk Line Association, the Central Passenger Association, the Southeastern Passenger Association and the New England Passenger Association, have granted a special rate of a fare and one-third, on the certificate plan, for the round trip, from all points in their territory, for delegates and friends attending the convention. This rate is good for three days (not including Sundays) preceding and the

three days following the adjournment of the convention.

When purchasing your ticket, ask the agent for a certificate showing that you have paid full fare going, and this certificate, when properly visé at the office of the secretary of the Association, will enable you to buy your return ticket at one-third the regular rate.

A special train for the Eastern delegates will be run over the Pennsylvania Railroad, details regarding which can be had by application at the office of the Association, 136 Libery street, New York.

#### CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Railway Committee of the Dominion Government has passed a bill giving to the Thousand Island Railway Company the power to generate electricity and engage in mining operations.

Surveys have been started to locate the line of the Greenwood & Phoenix (B. C.) Tramway Company, a distance of seven miles. Electricity will be used.

The Sunderland Electric Power Company of Sunderland, Ont., has been incorporated to supply light and power. Messrs. James Mc-Dermott and Henry Baldwin are directors.

The Brantford Electric Light Company of Brantford, Ont., is having plans prepared for the construction of a new lock, and has under consideration the installation of an additional 600 horse-power water-wheel and an auxiliary steam plant.

Incorporation has been granted to the Capital Power Company, of Ottawa, with a share capital of \$300,000. The company will deal in water power, electric and other motive powers. The provisional directors of the company are W. J. Conroy, O. H. Conroy, John McBain, J. C. Browne and R. J. Devlin.

It is seldom that such a representative gathering is brought together as that of last week in answer to invitations sent out by the Shawinigan Falls Water & Power Company of Montreal. There were representatives from the Cramp Shipbuilding Company, the Westinghouse Electric Company and other firms, while there was also a large contingent of bankers, engineers, capitalists and men of position. The main objective point of the party, the Shawinigan Falls, was, until very recently, an almost unknown wilderness, but to-day it is being talked about all over, for an enterprising company is harnessing the immense water power there, which is said to be second only to Niagara both in point of power and beauty. The property of the company comprises some 900 acres, part of which' is reserved for mill sites, while about 500 acres will be turned into a model town site. Inside of a comparatively few years this spot is expected to be a hive of industry, and even at this early date the sites have been secured for five manufacturing concerns. The conditions for generating power are almost ideal, the fall of the river being about 150 feet, and the total available power is estimated to be about 100,000 horse-power, but this will only be brought into use gradually. A large canal, with a power capacity of 50,000 horse-power, is being constructed for the upper basin of the river to the edge of the hill, where it ends with cencrete bulkheads. From this point the water is conveyed by immense iron pipes laid along the face of the hill to the power-house, 130 feet below. The work was

begun last July, and has been pushed all winter, so that it is expected that the first 5,000 hp. generator will be in place by November next. During next year the company expects to be in a condition to deliver power to Montreal on a large scale at a figure hitherto unattempted. No interference in winter is anticipated from anchor ice owing to the absence of rapids in the river above the falls.

#### LEGAL NOTES.

The General Electric Company of Schenectady, N. Y., has filed in the United States Circuit Court a suit against the Vulcan Foundry Company and the Pawtucket Brass Foundry. The suit is based on a patent the electric company holds on an invention by Albert Anderson of Boston, which consists of new and useful improvements in trolleys for electric service. It is alleged that the defendants have been supplying trolley harps, trolley forks and other devices that are an infringement.

Judge Wheeler, in the United States Circuit Court for the Southern District of New York, has handed down a decision in the suit of the Thomson-Houston Electric Company against the Bullock Electric Company and the Bullock the Bullock Electric Company and the Daniel Electric Manufacturing Company, sustaining the patent of Elihu Thomson, No. 401,085, re-lating to electric arc rupturing devices. The lating to electric arc rupturing devices. The court holds that six combinations are infringed by the defendants' apparatus.

## Fort Wayne Creditors will Receive \$175,000.

Attorney Charles H. Worden, trustee for the old Fort Wayne Electric Corporation, which was succeeded after the death of Mr. R. T. McDonald by the Fort Wayne Electric Works, the present concern, is busy at work closing up the affairs of the old company. He says that the business affairs of the old corporation will be closed up possibly before June 1. Besides the preferred claims, which included salaries of employes and other creditors for smaller amounts, the indebtedness of the corporation was about \$715,000. The delay in settling has been owing to the suits pending before Judge Baker at Indianapolis. An agreement has been reached between the parties concerned whereby a settlement is looked for immediately, after which Judge Baker will make his decision. After these settlements shall have been made the affairs of the concern will be wound up and the duties of the trustees ended. Another dividend of between 5 and 10 per cent. will be ordered by the court, and when this dividend shall have been made the payments to creditors will reach about \$175,000 or nearly 20 per cent. of all claims.

#### PERSONAL MENTION.

Mr. James Ellicott Hewes, of the firm of Hewes & Penniman, electrical engineers of Baltimore, has been appointed electrical engineer for Hagerstown, Md.

Mr. E. A. Carolan, assistant manager of the foreign de partment of the General Electric Company, is now in India in the interests of his concern. He will shortly proceed to China.

Mr. Will Christy, of Toledo, O., has been appointed president of the Southern Ohio Traction Company.

Mr. Bradford H. Starr has been elected superintendent of the Ringing Rocks Electric Railway Company of Pottstown, Pa.

Mr. W. H. Girvin has been appointed division superintendent of the Central New York Telephone & Telegraph Company for Syracuse and Onondaga County.

Mr. Harvey D. Gonse, who has been assistant manager of the Hudson River Telephone Company's Albany office, has been appointed general manager of the Saratoga division of that company with headquarters at Saratoga, N. Y. Mr. Gonse will take his new position May 14. Mr. J. S. McClelland, who is now district manager of the company at Saratoga, will succeed him.

#### INCORPORATIONS.

The Constant Battery Company, Brooklyn, N. Y. Capital stock, \$100,000.

The United States Electric Railroad Light Company, Philadelphia, Pa. Capital stock, \$125,000.

The Tyrone Electric Railway Company, Tyrone, Pa. Capital stock, \$25,000. President, D. S. Kloss.

The Geneva Electric Equipment & Construction Company. New York City. Capital stock, \$10,000. Directors: Edgar Swain and Adolf Hirschfield, New York City.

The National Association of Electrical Engineers, Camden, N. J.-to supply information pertaining to electrical engi-Capital stock, \$50,000. Incorporators: H. A. Salter, R. M. Eaton and F. R. Hensell.

The Warren & Brookfield Electric Light Company, Warren, Mass .- to manufacture and sell electricity for lighting, heating, etc. Capital stock, \$55,000. Incorporators: F. Slater, G. M. Faulkner and T. C. Perkins.

The Orange County Gas & Electric Company, Middletown, Capital stock, \$300,000. Directors: Edwin T. Hanford, Frank P. S. Crane, George A. Swayzee, Henry M. Hayes and John H. Galloway, Middletown.

The West Jersey Electric Company, Camden, N. J.-to deal in electricity. Capital stock, \$40,000. Incorporators: R. L. Anderson of Haddonfield, D. L. Clever, W. S. Mostander and J. F. Harned of Camden, R. A. Sheets of Westmont.

The D'Olier Engineering Company, Camden, N. J.-to deal in electrical machinery. Capital stock, \$50,000. Incorporators: W. L. D'Olier, H. D'Olier, both of Philadelphia, and F. W. D'Olier of Burlington; D. J. Pancast, attorney, Camden.

The Huguenot Electric Light, Heat & Power Company, New Rochelle, N. Y.-to furnish electric light, heat and power in the cities of Mount Vernon and New Rochelle and in the towns of Mamaroneck, Pelham and East Chester. Capital stock, \$50,000. Incorporators: Ex-Judge John J. Crennan, Quinten A. Corwin and John H. Schoffeld.

#### COMMERCIAL PARAGRAPHS.

#### Removal Notices

We are requested to announce that the Siemens & Halske Electric Company has removed its New York office from 320 Havemeyer Building to 40 New street.

The Montauk Multiphase Cable Company has removed its offices from the 18th to the 19th floor of the American Surety Building, 100 Broadway, New York City.

We are in receipt of a letter from Mr. Major, the famous cement man of New York, in which he sets forth some very interesting facts about Major's Cement. The multitudes who use this standard article know that it is many hundred per cent, better than other cements, for which similar claims are made, but a great many do not know why. The simple reason is that Mr. Major uses the best materials ever discovered and other manufacturers do not use them, because they are too expensive and do not allow large profits. Mr. Major tells us that one of the elements of his cement costs \$3.75 a pound and another costs \$2.65 a gallon, while a large share of the so-called cements and liquid glue upon the market are nothing more than sixteen-cent glue, dissolved in water or citric acid, and, in some cases, altered slightly in color and odor by the addition of cheap and useless materials. Major's cement retails at 15 cents and 25 cents a bottle, and when a dealer tries to sell a substitute you can depend upon it that his only object is to make larger profit. The profit on Major's cement is as much as any dealer ought to make on any cement And this is doubly true in view of the fact that each dealer gets his share of the benefit of Mr. Major's advertising, which now amounts to over \$5,000 a month throughout the country. Insist on Major's. Don't accept any off-hand advice from a druggist. Always have a supply of Major's cements on hand. If you are at all handy (and you will be likely to find that you are a good deal more so than you imagine) you can repair rubber boots and family shoes, and any other rubber and leather articles, with Major's Rubber Cement and Major's Leather Cement. And you will be surprised at how many dollars a year you will thus save. If your druggist can't supply you it will be forwarded by mail; either kind.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 504 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon p ent of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED WAY 1, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

ELECTRIC RAILWAYS AND APPLIANCES.

648,432. Railway-Signal. Seymour C. Prentiss, Detroit, Mich. Filed June 10, 1898.

648,592. Street-Car Fender. Augustus W. Shank, Detroit, Mich., assignor of one eighth to Charles A. Berger, same place. Filed Aug. 11, 1899.

648,536. Means for Operating Switches in Electric Tramways. Andrew G. Sharrow, Philadelphia, Pa., assignor of two thirds to Samuel Baum and Adam Baum, Jr., same place. Filed Oct. 26, 1899.

648,834. Trolley. Christopher H. Bierbaum. Buffalo, N. Y., assignor, by mesne assignments, to the Bierbaum & Merrick Metal Company, same place. Filed Jan. 20, 1990.

#### ELECTRIC LIGHTS AND APPLIANCES.

ELECTRIC LIGHTS AND APPLIANCES.
648,516. Electric Lamp With Burner of the Second Class.
Karl Ochs, Berlin, Germany. Filed June 29, 1899.
648,517. Electrical Glow Light With Illuminating-Body of
Second-Class Conductor. Karl Cchs, Berlin, Germany.
Filed Sept. 16, 1899.
648,518. Electrical Resistance. Karl Ochs, Berlin, Germany.
Filed Sept. 16, 1899.
648,625. Electric-Arc Lamp. Henry V. James, Salford,
England. Filed Oct. 10, 1899.
648,635. Apparatus for Removing Deposit of Carbon from
Incandescent Electric-Light Bulbs. Ernest W. Cushing,
Middleton, Mass. Filed Nov. 29, 1899.
648,731. Apparatus for Electrically Lighting Lamps. Henry
C. Farquharson, New York City. Filed Sept. 5, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

ELECTRICAL MACHINERY AND APPARATUS.

648.492. Thermo Electric Generator. John W. Harrison, Pueblo, Col. Filed Sept. 1, 1896.

648.493. Regulating Dynamo-Electric Machines. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 27,1899.

648.494 Regulating Dynamo-Electric Machines. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Original application filed Oct. 27, 1899. Divided and this application filed Jan. 12, 1990.

648.529. Dynamo-Electric Machine. Edward W. Robinson, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 8, 1888.

648.543. Electrical Attachment for Hydrocarbon or Other Burners. Ferdinand Wilke, Akron, O., assignor of one-half to Charles A. Ley. same place. Filed June 10, 1899.

648.546. Electrical Measuring Instrument. Joshua F. Begole. St. Louis, Mo. Filed Sept. 28, 1899.

648.555. Electric Switch. William Ely, Providence, R. I. Filed Feb. 19, 1897.

Filed Feb. 19, 1897.

648.671. Switch for Electric Circuits. James T. Robb, New York City, assignor to the Mitchell Vance Company, same place. Filed Dec. 21, 1899.

648,696. Method of Controlling Electric Motors. Martin T. A. Kubierschky, Berlin, Germany. Filed Dec. 6, 1899.

648,874. Booster Apparatus for Systems of Electrical Distribution. Lamar Lyndon, New York City. Filed Nov. 22, 1899.

#### TELEPHONES AND TELEPHONE APPARATUS.

TELEPHONES AND TELEPHONE APPARATUS.
618,533. Connection-Counter for Telephone-Lines. Charles
E. Scribner, Chicago, Ill, assignor to the Western Electric Company, same place. Filed Jan. 7, 1899.
648,647. Latch-Drop Device for Telephone Switchboards,
Ernest E. Yaxley and Charles C. Cadden, Chicago, Ill.,
assignors to the Victor Telephone Manufacturing Company, same place. Filed Sept. 15, 1899.
648,805. Service-Meter Apparatus and Circuit for TelephoneSubstations. Herbert E. Shreeve, Boston, Mass., assignor to the American Bell Telephone Company, same
place. Filed Jan. 22, 1900.
648,815. Indicator for Telephones. Charles F. Black, Goshen, Ind. Filed Nov. 15, 1899.

place. Filed Jan. 22, 1909.

648, 85. Indicator for Telephones. Charles F. Black, Goshen, Ind. Filed Nov. 15, 1899.

MISCELLANEOUS.

648, 378. System of Electrical Distribution. Oskar Behrend, Frankfort-on-the-Ma'n, Germany. Filed Dec. 28, 1897.

648, 406. Graphophone-Reproducer. William Hart, Kirksville, Mo. Filed June 14, 1898.

648, 448. Electromagnetic Coil. Richard Varley, Jersey City, N. J. Filed Dec. 18, 1899.

648, 481. Electrical Resistance. Arthur W. Berresford, Westfield, N. J. Filed Nov. 9, 1899.

648, 482. Electric Clock. Walter J. Dudley, Somerville. Mass, assignor to the Bangor Electric Clock Company, Bangor, Me. Filed Jan. 39, 1899.

646, 489. System of Distribution. William L. R. Emmet, Schenectady, N. Y., assignor to the General Electric Company of New York, Filed March 10, 1899.

648, 501. Apparatus for Supporting Overground Wires. Carl J. Kronenberg, Aufderhole, Germany, Filed Oct.12, 1899.

648, 505. Electric Fishing Apparatus. Ivar W. J. Lindbohm, Helsingfors, Russia. Filed Feb. 12, 1990.

648, 659. Plonographo-Telephonic Announcer. John E. Evard, Indianapolis, Ind., assignor to the Union Scale and Manufacturing Company, Sacramento. Cal. Filed March 13, 1899.

648, 659. Plonographo-Telephonic Announcer. John E. Evard, Indianapolis, Ind., assignor of one-half to Arthur A. McKain, same place. Filed July 8, 1898.

648, 673. Electrical Apparatus for Surgeons' Use. Henry Schlesinger. New York City, assignor of two-thirds to Charles Graf, same place, and William E. Willmann, Hoboken, N. J. Filed Nov. 88 1899.

648, 850. Electrical Apparatus for Surgeons' Use. Henry Schlesinger. New York City, assignor of two-thirds to Charles Graf, same place, and William E. Willmann, Hoboken, N. J. Filed Nov. 88 1899.

648, 850. Electrical Apparatus for Burgeons' Use. Henry Schlesinger. New York City, assignor of two-thirds to Charles Graf, same place, and William E. Willmann, Hoboken, N. J. Filed Nov. 28, 1899.

648, 659. Electrical Apparatus for Burgeons' Use. Henry Schlesinger. New York City, assignor of two

DESIGNS.
15. Telephone-Instrument Case. William D. Gharky,
Philadelphia, Pa. Filed April 2, 1900. Term of patent 7

years.
32,616. Telephone Switch-Box. William D. Gharkey, Philadelphia, Pa., assignor to the Sun Electric Manufacturing Company of New York. Filed Feb. 17, 1899. Term of patent 14 years.

# GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Alameda, Cal.—An election will be held June 9 to vote on the question of issuing \$10 erecting a new electric light plant. of issuing \$100,000 in bonds for

Anderson, Ind.—It is proposed to install an electric light plant in the new Christian Church that is under construction in this city.

Ashland, O.—F. E. Meyers & Brother contemplate the establishment of an electric light plant in their factory to cost \$25,000.

Blakely, Ga.—W. L. McDowell, city clerk, can be addressed in reference to a new electric light plant that is to be built here for which bonds have been

Bristol, N. H.—The Bristol Electric Light Company has increased its capital stock from \$8,000 to \$16,000, and will enlarge its plant. G. A. Emerson is presi-

Erie, Col.—An electric light plant is to be established here in the near future.

Franklin, Neb.—Arrangements are being made to put in an electric light plant here.

Galesburg, Ill.—The city council is discussing the question of establishing a municipal electric lighting plant to cost \$40,000.

Goldfield, Col.—The city council is discussing the question of electric lights.

Grand Island, Neb.—The prospects are good for the establishment of an electric light plant here.

Hallettsville, Tex.—The city council is discussing the question of erecting an electric light plant.

Herkimer, N. Y.—The board of trustees is discus-

sing the question of electric lights.

Jackson, Mich.—The Michigan Central will build a boiler shop and an electric light and heating plant here that will cost \$80,000.

Lakewood, O.—Bonds to the amount of \$15,000 have been voted by the citizens of this village for the pur-pose of enlarging the electric light plant. The im-provement will be started about June 1.

Lexington, Miss.—A company has been organized here to erect an electric light plant. Address H. W. Watson.

This town is agitating the ques-Marianna, Ark.tion of erecting an electric light plant.

Mt. Pleasant, Tenn.—This town is discussing the question of electric lights.

North Brookfield, Mass.—The citizens of this place are discussing the question of building or purchasing an electric light plant.

Norwalk, Conn.—The city council has been peti-loned to take steps toward establishing an electric light plant.

Oxford, Ind.—The electric light plant here was recently destroyed by fire. It will be rebuilt.

Phelps, N. Y.—Bids will be received here in July for electric lighting.

Republic, Wash.—A franchise has been granted F. C. Whitney by the county commissioners for putting in a complete electric light and water system here. A company is to be organized, and it is understood it will be backed by ample capital in Salt Lake. The cost of the plant will not be less than \$75,000.

Sparts, Tenn.—The question of an electric light plant for this place is being agitated.

Springfield, Ky.—A movement has been started to organize a company at this place for the purpose of erecting an electric light plant.

Welch, W. Va.—This city will issue bonds to assist in building an electric light plant and waterworks.

Windsor, Mo.—Plans are being prepared for the establishment of a new electric light plant at this place.

Woodhull, Ill.—This village has given a 20 year franchise for the establishment of an electric light plant.

#### STREET RAILWAYS.

Almont, Mich.—The common council of this place has granted a franchise to the Detroit, Rochester, Romeo & Lake Orion Electric Bailroad, and the road will be extended from Romeo to this village in the

Auburn, Mass.—If an electric railway is built from Southbridge to Worcester by way of this place and is managed by one company, people of this town are willing to stand half the expense of building the road.

Harrisburg, Pa.—A party of Duqueene capitalists, composed of C. D. Wiser, B. M. Davies, W. S. Bryan and T. V. Bay, has applied for a charter for an electric railway from this city to Sunbury, a distance of 54 miles. The capital stock is \$50,000.

Lake Bluff, Ill.—The officers of the new electric railway to be built from here to Fox Lake via Liberty-ville announce that they have secured nearly all the right of way from this place to Liberty-ville.

Lebanon, Tenn.-Investigation is now going on in

regard to building an electric car line from here to Alexandria.

Los Angeles, Cal.—An application has been made by Townsend Bros. for a franchise to build an electric railway at Long Beach.

Manle Rapids, Mich.—The citizens of this place are strongly in favor of the electric road which it is pro-posed to run through the town. They have subscribed \$4.000 and will add more to it.

Newport News, Va.—The consolidation of the Citizens' Railway, Light & Power Company, the Peninsular Railway, the Chesapeake & Hampton Roads and the Peninsular Light & Power, at this place, has been com-W. A. Post has been elected president of the consolidation.

O,hkosh, Wis.—The real estate board of this city has been granted franchises to build an interurban road between here and Berlin by way of Omro, Winneconne. Eureka and Wankan.

Philadelphia, Pa.—A meeting of capitalists was held in this city recently at which the subject of construct-ing a trolley railroad from Frederick, Md., to Gettyburg, Pa., a distance of seventy miles, was seriously considered. L. Victor Baughman is quite hopeful that considered. L. Victor Baughman is quite hopeful that the proposed road will soon be constructed.

Pittsburg, Pa.—There is some talk of the West Side Belt Line adopting electricity for suburban passenger t affic.

South McAlester, I. T .- A franchise for an electric railway between this place, McAlester and Krebs has been granted.

St. Louis, Mo.—It has been announced that the motive power of the Broadway cable line would be changed to electricity not later than May 15, and pos-

St. Johns. Ore.—The City & Suburban Street Car Company will change to electricity the steam motor line from Albina Junction to this place, a distance of five and one-half miles.

Troy, O.—There are prospects of an electric road from here via Casstown and Addison to St. Paris.

Toledo, O - Capitalists here have organized a synditoledo, O — Capitalists need have organized a syndi-cate to build a network of electric railroads, connecting this city, Sandusky, Cleveland, Tiftin, Tremont, Find-

lay, Port Clinton, and a number of other points.

Vandalia, O.—The village council granted a franchise to Mr. Wilson for the construction of an electric

#### MANUFACTURING.

Clifton Forge, Va.—The Clifton Forge Light & Water Company wants addresses of manufacturers of electrical storage batteries.

Denver. Col.-The Fire and Police Board recently let a contract to the Gamwell Electric Company of Chicago to install a new system for operating the fire and police alarms. The plan will be to operate them and police alarms. The plan will be to operate them from the wires of the electric company, instead of as at present by wet batteries.

Detroit, Mich.-The Datroit Citizens' Street Railway Detroit, Mich.—The Datroit Citizens' Street Kailway Company is building a storage warehouse, 41x140 feet one story high, to contain storage batteries of sufficient capacity to store the electricity necessary for running the cars for several hours in case of an accident at the power house.—The Edison Illuminating Company is again about to increase the size of its plant establishment of a storage battery sub-station on Miami avenue, at a cost of about \$150,000.

Menominee, Mich.—R. E. Jennings, H. Tideman, F. J. Drudell, and Enmas S. Jennings, all of this city are the incorporators of the Menominee Electric Manufacturing Company, recently formed to manufacture electrical appliances, etc., on a capital of \$28,000. This company succeeds the Menominee Electric & Mechanical Company. The plant will be increased in capacity.

New York City.—The Electric Pneumatic Power Company of this city will manufacture and sell electrical appliances and devices on a capital of \$100,000.

Philadelphia, Pa.—The Electrochord Company of this city, with Ctarles P. Fischer as the principal incorporator, was chartered a short time ago for the purpose of manufacturing the electrochord, an instrument which, applied to a piano, gives either a pipe organ or an orchestral effect.

Portland, Me.—The American Incandescent Company has been organized here for the jurpose of manufacturing and dealing in electrical apparatus, with \$100,000 capital stock.

St. Louis, Mo.—Bartel's Copper & Sheet Iron Works, 1,691 North 14th street of this city, wants to purchase an electric motor.

Syracuse, N. Y.-The H. P. Cameron Electric Company of this city was recently formed with a capital of \$10,000, for the purpose of manufacturing and selling electric and other appliances for street railroads and also other electrical apparatus and articles used in connection therewith.

Weehawken, N. J.—A factory in which a number of skilled workmen will be employed to manufacture electric supplies, is to be erected on Maple street in this city.

Wilmington, Del.—Another contract for cars is being finished by the Jackson & Sharp Co. for use on the island of Cuba. Workmen of the company have been

busy for many weeks filling the order, which is for 125 electric cars for the Havana Electric Bailway Company.

#### COMPANY MATTERS.

Albany, N. Y.—The board of directors of the United Albany, N. Y.—The board of directors of the United Traction Company is about to extend the traisformer house at Watervliet. Three rotary electric transformers and twelve static transformers will be added to the equipment already in position. Two rotary and three static transformers will be installed in a transformer house to be erected at North Albany. When these arrangements are completed the company expects to receive 2,000 electric horse power from the Mechanics-ville Hudson River supply at the transformer house at Watervliet and 500 horse power at North Albany.

Represent Ma—The Represent Electric Light

Brunswick, Me.—The Brunswick Electric Light Company has placed an order for a \$4 500 dynamo to take the place of two now in use at the station. An auxiliary steam plant is also contemplated.

Milwaukee, Wis.—The Falk Company of this city has made contracts amounting to \$300,000 for the rebuilding of some of the Kansas City street car lines, and for building an underground conduit on Eighth street for the feed wires. The company will do all the welding and special work, which consists in the construction of switches, force at struction of switches, frogs, etc.

Newburgh, N. Y.—The Consolidated Gas, Electric Light, Heat & Power Company of this place has voted to make extensive improvements to the plant. Machinery of \$17,000 value will be installed.

Ottawa, Ont.—The Ottawa Electric Company places the approximate value of its property destroyed at the recent fire in this city at \$300,000.

St. Louis. Mo.—A company known is the Bocker Carbon & Battery Company of this city will manufacture electrical machinery, with a capital of \$50,000.

Washington, D. C.—Plans are under consideration by the Washington Traction & E ectric Company providing for a single power station in this city. The plant is to be located at Great Falls and will be run by water power. At present there are eight stations in various parts of the District, which supply the electric power used in operating the eleven street railroad lines controlled by this company, and that which is consumed by the two electric lighting companies also under the

#### POWER AND TRANSMISSION PLANTS,

Florence, Ala.—A company of New York and Boston capitalists, which recently received from the United States Congress a charter to erect a power plant on the Mussel Shoals Canal, have representatives here for the purpose of making the final preparations. The plans of the company are not positively known, but it is Nine, the first canal up the river from Florence, 24 miles long, and extending this way, in which it will get a fall of more than 30 feet and develop semething like 30,000 horse power, enough so turn the wheels of every industry in North Alabama.

Tintic, Utah.—The Telluride Power & Transmission Company, which has been so successful in the operation of the big electric power plant of Telluride has arranged for the erection of a big plant here which will furnish power for the mines of this district and also electric lights for the city. L. C. Nunn is the local manager. local manager.

Worcester, Mass.-The overseers of the poor are worcester, Mass.—The overseers of the poor are considering plans for harnersing a mall body of water for power purposes. At the Home farm is a pond, covering two acres, containing a body of water that can be utilized for water power, and possibly be of considerable value to the city. This pond is a short distance from Boylston street, on the city land, and is held by a dam 20 feet wide. The water has a fall of 12 feet.

#### AUTOMOBILES.

Chicago, Ill.—If the plans of the promoters of the Hub Chicago, III.—If the plans of the promoters of the nuo Motor Transit Company here are carried out, 50 electric omnibuses will be running on established routes on scheduled time between the business and residence sections of this city within a short time. The mechanism is placed in each of the hubs of the four wheels, and the storage battery power being transmitted direct to this mechanism gives to each wheel an active indeto this mechanism, gives to each wheel an active inde pendent propelling power. designated as "Imperials." The autocars are to

New York City.—P. J. Daly, master workman of the Liberty Dawn Association of Cab Drivers, an-nounces that in a few weeks an automobile service substituted for the present horse drawn cab service at the Waldorf Astoria.

Penacook, N. H.—Mr. A. H. Hoyt, of this place and Colonel B. F. Drake, of Lakeport, are to manufacture automobiles here.

Trenton, N. J.-A corneration known as the Automobile Patents Exploitation Company, organized under the laws of this State with a capital of \$1,000.000, proposes to get control of various advanced patents, entering into the manufacture of automobiles, the rights on which will be disposed of to subordinate companies from whom royalties will be exacted by the parent concern.

Utics, N. Y.—The D. B. Smith Company of this city is said to have made preparations to build automobiles.

# THE TELEPHONE WORLD.

#### Telephone War Fast Approaching a Head.

The New York "Commercial" says that capitalists and promoters actively identified with telephone affairs, and who are vitally concerned in the outcome of the impending struggle, declare that within the next half year the country will be treated to the most bitter telephone war that has even been instituted.

The Bell's rival, the Telephone, Telegraph & Cable Company of America, is about ready to come out in the open to fight its enemy, and knowing this to be true the Bell Company has left nothing undone to contribute to the discomfiture of its young rival and strengthen its own position. When the declaration of hostilities is made the contestants will be pretty evenly equipped, but the public will no doubt receive the Bell's rival with open arms.

#### New Telephone Company.

The Eastern Telegraph & Telephone Company recently incorporated in Trenton, N. J., has absorbed the South Jersey Telegraph & Telephone Company, which holds a franchise in every county in South Jersey. The new company purposes to establish an exchange in Camden and to run lines throughout the county. It is proposed to charge commercial houses \$36 per annum and residences \$24 per annum. Steps are being taken to obtain a New York terminal.

The People's Telephone & Telegraph Company, which operates at independent exchange at Knoxville, Tenn., is sail to be contemplating the extension of its lines to Chattanooga. The company is preparing to enter the long distance field more fully during the present summer and fall than ever before. It is probable that application will soon be made for an amendment of the company's charter, which will permit it to operate in a wider field than at present. Although the directors and management of the company are always reticent as to their plans, it is known that this step is now in contemplation, and that plans are on foot extending their lines all the way to Chattanooga, and for completing the connections in upper East Tennessee, which were lost by the sale of the Morristown Telephone Company recently, including its toll lines.

Sealed proposals will be received at the office of the District Commissioners of Washington, D. C., until 12 m., Saturday, May 19, for furnishing underground telegraph and telephone cables for the fire alarm and police telegraph and telephone service in the District of Columbia. Separate bids will be considered for the several items enumerated. Specifications and blank forms of proposals may be obtained at the office or by addressing John B. Wight, John W. Ross and Lansing H. Beach, Commissioners.

The Iowa Telephone Company's monopoly of the Sioux City telephone business, which it has just secured by the swallowing of the Home Telephone Company, may be broken by the Black Hills Telephone Company, which has made application for a twenty-year franchise in Sioux City, apparently with a desire to establish a new exchange there. The rates the new company proposes to establish are much lower than the rates now in force,

It is stated officially that within thirty days the Long-Distance Telephone Company of Virginia will have its lines running into Richmond. This will put Richmond in telephonic communication with Virginia points as far West as the Hot Springs. The only link uncompleted is thirty miles, from Richmond to Louisa Court-house. The contract to complete this line within thirty days has been awarded.

The old war between the Bell Telephone Company, which operates the Iowa 'phones in Des Moines. Ia., without franchise or authority, and the independent mutual companies of the State, has been renewed. This time it has broken out in Indianola. Warren County and has already gone so far as to threaten the prosperity of one or the other of the companies in that city and county.

Cortland, N. Y., is to have an independent telephone company, which will be closely allied with the telephone company in Binghamton, and a new company which is working in Rochester. In other words, the promise of the local telephone men that they would furnish a county and State service seems to be coming true.

The Harrisburg (Pa.) Telephone & Telegraph Company has been organized. The company has an ordinance before the corporation committee of the council of that city.

The Bell and the People's Home Telephone Companies are both trying to connect with Woodlawn, Ala.

Public sentiment in Lynn, Mass., is in favor of competition in the telephone business.

#### Rivals for Telephone Franchises.

Three telephone companies have filed applications with councils for franchises in Reading, Pa. They are the Berks, the Independent and the Keystone, which operate lines in Norristown, Phoenixville and other places down the valley. All stipulate a reduced cost of the service and promise, in the course of time, to lay their wires underground.

#### The Independent Meeting.

The Independent Telephone Association of the United States will hold its next annual meeting in Cleveland on June 12, 13 and 14. Judge J. W. Thomas, of Chillicothe, Ohio, is president of the association.

### "Hello" Girls Happy.

A reduction in the working hours of its employes has been made by the New York & New Jersey Telephone Company. Instead of working ten hours a day the operators will be obliged to work but nine hours. The new order went into effect May 1. There was no demand for less hours made by the employes, but they are much gratified at the change. Operators in Jersey City, Newark, New York and Brooklyn, are included in the reduction of hours.

#### The Austrian Telephone System.

We are in receipt of an attractive little pamphlet from the Ericsson Telephone Company, 296 Broadway, New York, known as the Ericsson Series, Part Three, which we are informed will be mailed free of charge to persons interested in the subject. In it is to be found considerable information of value, and among other things the telephone situation in Norway and Austria is referred to. In speaking of the latter country the pamphlet says:

"The telephone system in Austria has always been held to

"The telephone system in Austria has always been held to be governed by the decree of the 16th of January, 1874, relating to telegraph lines, and therefore as within the control of the State. In the beginning, the use of the telephone was extended throughout Austria by individuals or private corporations, to whom the Government granted certain privileges for that purpose, limited as to time. Such concessions were made chiefly during the years 1881 to 1885, inclusive.

"Later, when the development of the telephone advanced beyond expectation, the Government decided to cease granting privileges of this character, and, at the expiration of the respective terms for which they were then outstanding, to resume those already granted.

"The telephone systems established under the concessions originally granted by the Government were recovered by the State upon the conditions especially reserved for that purpose in the grants, and this included all construction and apparatus erected by the grantees.

"The indemnity in such cases was agreed upon by arbitrators, one of whom was nominated by the Ministry of Commerce, one by the grantees, respectively, and the third by the two so nominated. The basis of such indemnity was taken in each case to be the original cost and labor of establishing the line, its present value, with a due allowance made for deterioration. The Government took possession on the 1st of January, 1863, of ten city telephone lines, with a total number of 4,248 subscribers. The aggregate amount paid for them by it was 1,400,000 florins (\$568,400).

"On the 1st of June, 1895, the telegraph and telephone

"On the 1st of June, 1895, the telegraph and telephone property of the Vienna Private Telegraph Company was acquired by the State. It consisted of twelve private telegraph stations and 7,700 telephone subscribers. The amount paid by the Government was 4,000,000 florins (\$1,624,000).

"By a decree of the Ministry of Commerce, dated the 7th of October, 1897, the principle of Government ownership of all telephone lines within the Empire was established, and under that decree, negotiations were had which ultimately restored to the Government such privileges as had been granted by limited concessions to individuals and corpora-All telephone property used for public service in Austria is now owned and controlled by the State. Private telephone conversations, lasting not longer than three minutes, are charged for as follows: Within the city or town limits, 10 kreutzers (4 cents); for a distance less than 50 kilometers (30 miles), 30 kreutzers (12 cents); for distances between 51 and 100 kilometers (30 and 60 miles), 50 kreutzers (20 cents); for distances between 100 and 150 kilometers (60 and 90 miles), 80 kreutzers (32 cents); for distances beyond 150 kilometers (90 miles), 1 florin (40 cents)."

There are 1,200,000 miles of copper wire used in telephone service in the United States, and 4,000,000 calls are received daily in the telephone exchanges of the country. The wire would girdle the earth at the equator forty-eight times, or reach from the earth to the moon five times.

#### Suit Against Telephone Company.

The city of Duluth, Minn., has begun its fight against the Duluth (Bell) Telephone Company by suit in the district court, to compel it to remove its wires and poles from the streets, its franchise having run out, and no new one having been secured. Some time ago the company brought suit in the United States Court to restrain the city from interfering with it, as the city had threatened to forcibly remove its poles and wires. The city has assumed the offensive in this suit in the hope of hurrying the matter through the courts and getting a final decision on it.

# The Western Telephone Construction Company's Assets Sold.

On the 28th ult., a syndicate purchased the name, patents, good will and all tangible assets of the Western Telephone Construction Company of Chicago from the receiver in the bankruptcy proceedings instigated earlier in the month.

There were a large number of bidders at the sale. The assets were divided into three classes, one of which comprised the patents, and when this item was offered, the bidding was quite spirited between the Western Electric Company and the American Electric Telephone Company, but the bid of the syndicate for the entire assets, was for a larger amount than the three separate offers combined, so the new concern got everything.

This syndicate is now incorporating a new company under the same name with a capital of \$250,000 and the business is to be operated at 153 to 159 South Jefferson street, Chicago, and they are now ready to fill orders:

We are assured that the subscribers to the stock of this new company are gentlemen of means, none of whom were connected with the old concern, and the business will not be hampered for the want of funds. The practical management of the business is in the hands of men who stand at the head of the telephone business and an effort will be made to operate the business on a very much larger scale than heretofore.

The Home Telephone Company, which has been in operation in Sing Sing, N. Y., for several years, has just gone through a reorganization. The old officers were all Sing Sing men. The new officers are L. M. Simpson, of New York, president, and W. S. Sisley, of Jersey City, secretary and treasurer. There has been a lively competition with the New York Telephone Company, which put its long distance instruments down to \$2 a month. Among new subscribers to the New York Telephone Company are the old officers of the Home Company. There is a rumor that the Home has been bought out by the New York company.

A British investigator, says the N. Y. "Sun," has been studying the motions of a telephone receiver diaphragm. They have long been known to be very slight, so small indeed, that many students of the subject have been led to think that the diaphragm does not move at all as a whole. The recent experiments show that the movement for barely audible sound is one and one-half millionths of an inch; for "comfortable" sounds the movement is about two millionths, while a movement of forty millionths results in uncomfortably loud sounds. When the diaphragm surges back and forth as much as one five-thousandth inch the telephone makes a deafening noise.

The House Committee on Post Offices and Post Roads authorized Representative Bingham to favorably report the bill including telephones with telegraph companies in the laws under which the Postmaster General fixes the rates for official messages.

The Ohio independent Telephone Companies' Association will hold its annual meeting in Cleveland on May 9 and 10. It is stated that in the neighborhood of 150 independent companies will be represented.

The Pacific Coast Telephone system made a net gain of 2,012 subscribers in April; total number connected April 30, was 73,196, of which 18,688 are in San Francisco.

#### TELEPHONE INCORPORATIONS.

The Wyoming Telephone Company, Dover, Del.—to construct and operate telephone lines in Wayne, Wyoming; Lackawanna, and adjoining counties of Pennsylvania. Capital stock, \$10,000.

The Ithaca Telephone Company, Ithaca, N. Y. Capital stock, \$10,000, Directors: John P. Van Ostrand, F. S. Bronson, Lansing G. Haskins, Fred C. Bloodgood, Mark T. Atchley, William Thomas and Arthur W. Sperry, of Geneva.

# SECURITIES. ELECTRICA

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

## NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16%@17c.; Lake, 17@17kc.; casting, 16%@17c.

The transfer books of the Amalgamated Copper Company closed May 7 for the annual meeting to be held June 4 and will reopen June 5.

The Brooklyn Rapid Transit Company will tear down the Sea View Elevated Railroad at Coney Island and rebuild it as a surface trolley line.

The suit of the Widener-Fikins syndicate to recover 30,000 shares of Pittsburg Consolidated Traction from Whitney & Stephenson has been discontinued.

The Hub Motor Company, with a capital of \$1,000,000, to manufacture motor vehicles of all descriptions, was incorporated at Trenton, N. J. on the 2d inst.

The United Traction Company of Albany, N. Y., paid its first dividend on May 1. It is 1½ per cent. on the new stock and equivalent to 5 per cent. a year.

It is stated that the stockholders of the Cincinnati Street Railway Company will be acted the company of the Company of the Company will be acted that the stockholders of the Cincinnati Street Railway Company will be acted to the company of the Company of the Company of the Company of the Company of the Company will be acted that the stockholders of the Company of the

be asked to authorize an increase of capital stock from \$18,000,000 to \$20,000,000. Judgment for \$26,019 was recently obtained by default against the Woolf Electric Disinfecting Company, formerly of 66 Broad street, this city, in favor of Hazen L. Hoyt, for money lent to the company.

The Southern Light & Traction Company reports for the year ended March 31 Net earnings, \$155,561; interest on bonds, \$81,339; balance, \$74,222. The surplus equals 4 64 per cent. on the outstanding stock.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 20@23; New York Electric Vehicle Transportation, 94@10; New England Transportation, 5@54; Gramophone, 45@50.

The Idaho Southern Railway Company was recently incorporated at Trenton, N. J., with \$5,000,000 capital. The company purposes to operate railways, telegraph and telephone lines in Idaho. James W. Adair, Edward S. Jacob and Harry S. Baltz of Jersey City are the incorporators.

The Duquesne Traction Company has declared a semi-annual dividend of \$1 per share, payable May 5. The Diquesne Traction Company is leased to the Consolidated Traction Company of Pittsburg, Pa., under a guaranteed rental of \$120,000, or 4 per cent. per annum on its capital stock of \$3,000,000.

The statement of the National Electric Company for the first nine months of its present fiscal year shows a net income of \$163 878, or at the rate of \$218,000 for the full twelve months. This amount—\$218,000—is equal to between 8 and 9 per cent. on the \$2,500,000 paid in on Philadelphia Electric stocks, or about 22 cents per share on the 1,000,000 shares.

For the purpose of funding the floating debt and providing working capital the Sprague Electric Company has mortgaged all its property, letters patent, plant, etc., to the Farmers' Loan & Trust Company, as trustees, for \$1,200,000, to secure an issue of gold bonds for that amount, due in ten years at 5 per cent. The property is located in this city and also in Bloomfield and East Orange, N. J.

The Boston "News Bureau" says: "The Boston Stock Exchange has placed in the unlisted department the stock of the American Telephone & Telegraph Company, when and as exchanged for the stock of the American Bell Telephone Company. The authorized capital stock of the American Telephone & Telegraph Company is \$100,000,000. "Rights" may be traded in but not recorded."

pany is \$100,000,000. 'Rights' may be traded in but not recorded."

The following is a list of efficers and directors of the American Telephene & Telegraph Company: President, John E. Hudson; vice-president, Edward J. Hall; treasurer. Wm. B. Driver; secretary, Melville Egleston. Directors: Chas. & Amory, Melville Egleston, John E. Hudson, Alexander Cochrane, Edward J. Hall, Edward P. Meany, Joseph P. Davis, Henry S. Howe and Wm. D. Sargent.

John H. Davis & Co., Townsend. Whelen & Co., and E. H. Gay & Co., notify holders of Richmond Railway and Electric Company that the property has been acquired by the Richmond Passenger and Power Company, and that bonds are to be exchanged at par for a new issue of \$3,000,000 twenty-five year 5 per cent. bonds of the new road. A majority of holders have assented to the exchange. Copies of the bondholders' agreement may be obtailed at any of the effices mentioned.

The Philadelphia "Steckholder" says: "It is understood that in the not distant future application will be made to have securities of the Union Traction Cempany, of Chicago, listed on the Philadelphia Stock Exchange. Localcapital is to a large extent interested, and action of this character would, therefore, seem to be desirable. The stocks are very closely held by conservative investors in this city, who claim that the company has an exceptionally bright future before it."

A call has been sent out for a meeting of the stockholders of the New England

A call has been sent out for a meeting of the stockholders of the New England Street Railway Company in Jersey City May 14, to take action on a contract made recently between the directors and George A. Fernald & Co., disposing of the stock of the Winchester Avenue road of New Haven at \$49 a share. The proposition will also be made to reduce the capital stock of the New England Street Railway Company from \$5,000,000 to \$2,000,000, making possible the distribution of the proceeds of the sale as soon as delivery is made.

pany from \$5,000,000 to \$2,000,000, making possible the distribution of the proceeds of the sale as soon as delivery is made.

Receiver Grant, of the Third Avenue Railroad Company, has submitted by order of the court a statement of the company's earnings for March, showing: Total receipts, \$214,885: disbursements \$82,555; balance, \$132,330; interest and taxes, \$34,-247; surplus over charges, \$98,683. The duties of Mr. Grant as receiver will practically end May 19. On that date the sale of \$35,000,000 in bonds necessary to pay the road's debts will be voted. Mr. Grant expects to be relieved of his duties as receiver not later than June 1. The day the receiver was appointed, February 28, Third Avenue stock was quoted at 454. Yesterday it stood at 108½.

One of the largest mortgages ever recorded in the vicinity of Gloversville, N. Y., was that given recently by the directors of the Cayadutta Electric Railroad on its entire property of \$600,000 to the New York Security and Trust Company of New York as trustee, to secure an issue of consolidated 5 per cent bonds of the amount of the mortgage. Three hundred and fifty thousand of the amount is to be held by the trust company to retire the first mortgage 6 per cent. bonds which mature in 1902. The electric road is now operated by the Fonds, Johnstown and Gloversville Railroad. The remainder of the money will be used to pay present indebtedness and for future improvements. ness and for future improvements.

The committee appointed by the stock holders of the Welsbuch Commercial Company and the Welsbach Light Company to consider the changes which have taken place in the character of the Welsbach business since its separation into manu facturing and commercial companies has submitted its report. They suggest that a new company be organized with an authorized capital stock of \$3,500,000 and a large sinking fund and buy the shares of the Welsbach Light Company not owned by the Welsbach Commercial Company and the common and preferred shares of the Welsbach Commercial Company. The new corporation has been organized under the laws of New Jersey as the Welsbach Company.

under the laws of New Jersey as the Welsbach Company.

Articles of incorporation were recorded in Newark, N. J., on May 4, by the Edison Manufacturing Company, with a capital stock of \$500,000. It is divided into 5,000, shares, and \$1,000 has been paid in. The incorporators named are Howard W. Hayes, Edward H. Duryee and John E. Helm, of Newark. Its objects, as set forth in the papers, are to "manufacture and sell all kinds of machinery and mechanical and electrical appliances and to acquire the property, assets and good will of other companies, to acquire letters patent and patent rights in the United States and other countries, and generally to do everything connected with the business of manufacturing and selling all and every kind of machinery and apparatus." Its principal office will be in West Orange, N. J.

### EDITORIAL NOTES.

The Philippine Islands as a Possible Source of Our Copper Supply.

The Philippine Islands, while at the present time a cause of expense and no little trouble, prom-

ise to abundantly repay us in the future for all the present perplexities. They are known to be abundant in timber, mineral, agriculture and other resources, and not the least is the copper supply which may be derived from various localities on the Islands. Copper ores are said to occur in the following islands: Luzon, in the provinces of Lepanto, Benguet and Camarines; Mindoro, Capul, Masbate, the province of Antique in Panay, the province of Surigo in Mindanao. While it must be conceded that many of these resources may not be found to be profitable upon further investigation, while the great island of Mindanao is practically unexplored and is full of possibilities, and while the attempt at Masbate to work successfully the deposit which is known to exist there has not been what might have been desired, yet, on the other hand, the deposit in northern Luzon is valuable beyond any question of doubt. The best known portion of this region lies in the neighborhood of Mount Data, in latitude 16° 53', and longitude 120° 58' east of Greenwich. This peak is only one of a range of mountains trending due north to Cape Lacay-Lacay, and forms a boundary for all the provinces infringing upon it.

Data itself lies in the province of Lepanto, already mentioned, and in the range, of which it is one peak, copper ore has been smelted by the natives from time immemorial, and before the islands were discovered by Magellan. The process employed is a complicated one, based upon the same methods as those employed in the smelting of sulpho-salts of copper in Europe and America. It consists in alternate partial roasting and reduction to "matte" and eventually to black copper. It is generally believed that this process must have been introduced from either Japan or China. It is practiced at the present day by only one peculiar tribe of the natives, the Igorrotes, who are remarkable in many ways.

There are unauthenticated reports as to the routes by which copper comes to market that is smelted by the natives, which indicate that there are extensive copper mines in various portions of the Cordillera Central, but the only

deposits which have been examined with any care are those at Mancayan, about five miles to the west of Mount Data, and two or three localities within a few miles of Mancayan. The deposits at the latter place are described as being veins of rich ore, reaching seven meters in width and arranged in groups. Mean assays are said to show over 16 per cent. of copper, mainly as tetrahedrite and allied ores. The gangue is quartz, and the country rock is described as a large quartzite lens embedded in a great mass of trachyte.

\* \* \*

When a monarch dies the cry of "The king is dead, long live the king!" is

usually heard. In the business world of to-day an apt exclamation would be "Keeley is dead, long live Keeleyism!" for in spite of the numerous bubbles that have been inflated in the past, only to burst, and which should have served as a warning to that class of people who are reputed to be born every minute, every properly-advertised fake scheme has a host of applicants for stock or what-not, who dare rush in "where angels fear to tread."

The Rev. Jernegan's electrolytic scheme for extracting gold from sea water should have somewhat dampened people's interest in this particular line of investment, but such would seem not to be the case, for, according to the London "Daily Mail," patents have been taken out in England on a sea water gold extracting process, which is attracting considerable attention. As in the majority of schemes of this nature, the modus operandi is kept to a certain extent secret. A representative of the "Daily Mail" became acquainted, however, in some way with the "open sesame," and made a test of the process, the results of which are quite interesting. After referring to the fact that he was alone, and received no assistance in any way from those connected with the patent, he says:

"I could only experiment with a very small amount of water—a few gallons—and I did not therefore expect to get a vast quantity of gold. My idea was to prospect for a trace of gold, and then to refer to the ocean itself those anxious for larger quantities of the metal. I had been privately apprised of the nature of the particular substance which was to do the main work in wresting the gold from the water; and I had myself purchased, at a tradesman's, selected on the spur of the moment by myself, unknown to anybody else, a quantity

of this substance. I am not allowed to mention just what it is, but it is a thing in daily use by many people, and is to be purchased in quantities for a few pence or a few shillings, according to the amount desired. Having obtained my few gallons of sea water, I dropped therein the substance I had bought, which I was assured, would precipitate to the bottom of the water a muddy residuum technically known as 'sludge,' which sludge would contain such gold as the water contained."

Being unfamiliar with the process the experimenter dropped in, so he states, forty times too much of the "nameless" substance, which obliged him to carry away too much sludge, but in no way invalidated the experiment. He then continues:

"My three jars of sludge I took to an assayer; and in selecting my assayer I purposely avoided, n order to secure greater independence for my test, the assayers who had formerly assayed the sludge taken to them by the patentees, in which they had found 0.150 gr. of gold, equivalent to 9.729 milligrams from 50 gallons of water."

The assay of the sample of sludge obtained by the representative of the paper already referred to showed but 0.2 milligrams of gold. "Here, then," he says, "are the simple facts of the test. What the patentees, or a syndicate to be formed by them, intend to do is to purchase or rent land near the sea coast, and run sea water on to it at every tide. Precipitating the sludge at each tide, and then letting the water out, they propose to continue until such time as it might be deemed advisable to have a clean up, when the sludge would be dug up, and the gold separated in the ordinary way. The patentees calculate that the 'pay dirt' thus obtained would be rich enough to yield big dividends. Upon that point it is obviously too early to express an opinion. That it is an imaginative and picturesque scheme cannot be gainsaid; but the infinitesimal trace of gold revealed by this test does not seem to herald a day when a man may go into a 'bureau de change,' plank down a bucket of sea water, and receive a sovereign or two in exchange. Certainly much better assay reports have been yielded by former tests made by the patentees; but the desire of those patentees to permit a syndicate to share the marine gold with them suggests more benevolence than one often meets with nowadays,"

Possibly the Old Englanders are more conservative and hard-headed than the New Enganders proved themselves to be some two years ago, and that they will not nibble at the alluring gold bait held out to them, for the scheme just described should unquestionably be classed in the same category with the Keeley motor, liquefied air for power purposes, and various electrical curative devices.

The Testing of

An interesting series of tests were carried Third Rail Systems. on last month by the Boston Elevated Rail-

road Company in order to ascertain what system was best adapted for use on its new elevated lines. The trials, which extended through almost the whole of April, took place at night in the subway, where two of the tracks had been equipped with the third-rail. The competing concerns were the Sprague Electric Company, the General Electric Company, and the Westinghouse Manufacturing Company. The Sprague Electric Company exhibited its

multiple-unit system, which has given such excellent results on the South Side Elevated Railroad of Chicago for the past two years; the General Electric made use of a new master-controller system invented by Prof. Elihu Thomson, while the Westinghouse Company pinned its faith on an electro-pneumatic sys-

Mr. Sprague's multiple-unit system is now so well known that a description of it would be superfluous. The master-controller system of the General Electric Company is something new, and is described in the last issue of the "Street Railway Journal" as follows:

"The main controller proper of each car consists of a series of magnets or solenoids, each of which operates a contact with magnetic blow-out, accomplishing the same purpose as one of the usual contacts on ordinary handoperated controllers. There is one of the main controllers under the body of each car. On each platform of each car is a master controller of the usual form, but of smaller size. This master controller simply closes and opens the circuits of the solenoids or magnets of the main controllers."

In the Westinghouse electro-pneumatic system of control, the holding over of a handle of a multiple-control switch energizes a magnet which operates a compressed air cylinder valve, resulting in the controllers throughout a train being automatically advanced step by step, the acceleration depending on a make and break device located on the multiple-control switch.

In the trials at Boston the trains consisted of four cars, each of the latter being equipped with two motors of about 150 hp. each. The tests consisted of voltmeter readings, of ammeter readings to determine the amount of current going to the motors, and timing in the running. Besides these, instrument readings were made with one or more motors shut down and with couplings disconnected.

The trials proved most satisfactory in every way, all three systems showing up well. It is understood, however, that the directors of the Boston Elevated Railway Company rather lean towards the Sprague multiple-unit system, which would seem borne out by the fact that the executive committee of the Elevated Company has just placed an order with the Sprague Company for enough controllers to equip some sixty of its cars. This will involve an expenditure of but \$100,000, whereas the whole contract will entail an outlay of about \$1,000,000. The extensive trials in Boston, and the information as to the working of the various systems obtained through them, is very timely, in view of a large contract amounting to some \$2,000,000 about to be let for the equipping of the elevated roads in this city.

An interesting exhibition of the telegraphic machine invented by Prof. Henry A. Rowland of the Johns Hopkins University of Baltimore, Md., which was described in the issue of Elec-TRICITY of November 2, 1898, will be made at the Paris Exposition, and the officers of the American Commission have manifested much interest in it. Two good stations in the Electrical Building have been assigned to it at points distant from each other, so that visitors may see both ends of the line in operation. Dr. Thomas D. Penniman and Henry H. Wiegand, electrical engineers, both of Baltimore, have charge of the exhibit. It is probable that after the Exposition is over a long-distance demonstration will be made in Europe.

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

Wireless telegraphy is to be made use of in Westchester County in this State to connect Peekskill and Yorktown.

MR. JULIAN PFAN, of the graduating class of the Rensselaer Polytechnic Institute of Troy, N. Y., has been awarded the Charles McDonald prize, \$120, for the best thesis. His subject was "The Development of a Power Plant on the Hudson River."

THE United States section of the electricity exhibit at the Paris Exposition was recently damaged by a storm. Water poured through the leaky roof, ruining the decorations and carpets, and damaging the facade, which is one of the most attractive.

THE Electric Express Company is now carrying freight between the various cities and towns of Connecticut from Noroton and New Haven and between Bridgeport and Ansonia over the trolley lines connecting these points.

THE latest idea for the comfort of the public of the city of Quebec, Can., is an electric street sprinkler. It is stated that negotiations are being made with the Street Railway Company to run such a sprinkler over its lines in all parts of the city four times a day during the coming summer.

TO ENABLE tourists to cross the English Channel without the inconvenience of seasickness a Frenchman has designed a submarine boat to be propelled by cable traction. It will accommodate nearly 250 passengers, and will make the journey in about an hour, and should any accident happen to the motive power the boat may be detached and will at once rise to the surface and may continue the journey in the ordinary manner.

Workmen are engaged in placing an electric motor on the drawbridge at Beach Channel, L. I. The power will be transmitted to Beach Channel from the battery house of the Long Island Railroad at Hammel's station. During the summer months the bridges at Beach and Broad Channels must be opened very often each day so as to allow the large number of pleasure boats going to and coming from Far Rockaway to pass through.

HAVING obtained satisfactory results with the wireless telegraphy system developed by the Signal Corps, which has been operated in New York Harbor, Brigadier General Greely is said to be making arrangements to establish it at other points. It is understood he intends to equip San Francisco Harbor with the system and will also send sets of instruments to the Philippines and to Porto Rico. It is expected the system will be of great value in the Philippines in maintaining communication between garrisoned posts.

THE telephonograph, which is a modification of the phonograph, was recently inspected and tested by the German Postmaster-General and several engineers. Its inventor, Herr Paulsen, a Dane, has replaced the wax cylinder of the Edison phonograph by a steel band, and the style by a magnet energized by a telephone. Currents transmitted by the telephone pass through the electromagnet, and create conse-

quent poles on the steel band, and more or less the converse operation is employed for reproducing the sound. A long line can, of course, intervene between the transmitting telephone and the phonograph itself, and it is suggested that a telephone subscriber on leaving his office can set such a telephonograph to receive telephone messages during his absence. Even if the efficiency of the instrument is only twice that of the average office boy, comments the "Electrician," London, it should find many purchasers.

THE Government is considering the idea of constructing an electric weather signal system at Fairport Harbor, Ohio. A weather bureau is now established at the dock company's office, and the reports received are made known to the vessels in the harbor by means of flags. Government agents have made inquiries recently of the Commercial Electric Light Company at Painesville as to whether power for four 50 candle power white lights and two 50 candle power red lights could be furnished. If the idea is adopted a high iron tower will be built on the bluff by the dock company's office, and the weather signals will be flashed at night from the top. In this way vessels passing on Lake Erie may read the signals at night.

The utility of the electromagnet for removing pieces of iron and steel when in very awkward places was instanced in a German mine. A bore was being sunk, and at a depth of almost 1,000 feet, the hardened end of the steel bit broke off. This obstruction naturally prevented any further boring. In order to get the broken piece of steel out, therefore, a softiron bar 5 feet long and 2.7 inches in diameter was surrounded by a single winding of indiarubber-covered wire. It was then magnetized by means of a small dynamo and let down the When at the bottom, current was switched on through the wire turns, and in this way a fairly powerful magnet was obtained, which raised the steel to the surface without further trouble.

THE rapid completion of the Albany & Hudson Electric Road is attracting much attention, and railway experts from all over the Union are watching the progress of this vast undertaking. Nothing of the kind so extensive has ever been attempted before, and for the first time, apparently, people are beginning to realize the immensity and importance of the great electric road that is now nearing completion, which is to connect the three counties of Albany, Columbia and Rensselaer. Every effort is being made to get the road in operation by July 1, and for every day saved the contractors are awarded a substantial bonus. The third-rail system will be used throughout, and it is the only road of its especial kind known. It is claimed to be a combination of all the best known features of all roads now in operation.

SECRETARY GAGE and a number of officials and scientists, including Dr. McMurtrie, president of the American Association of Chemists: Dr. Kennelly, of the American Institute of Electrical Engineers; Capt. Sigsbee, chief of the Naval Bureau of Information, and Prof. Stratton, of Chicago University, were before the House Committee on Coinage Weights and Measures recently to advocate the establishment of a national standard bureau for the purpose of testing scientific and other instruments of precision. The committee voted

favorably on the measure, and agreed to offer it as an amendment to the sundry civil appropriation bill. The bureau will involve an expenditure of about \$200,000, and an annual outlay of \$35,000.

WILLIAM A. EDDY, the kite expert of Bayonne N. J., demonstrated by an experiment with 1,000 feet of steel wire last week that at a height of 600 feet electricity was drawn far in advance of the storm.

One of the direct results arising out of the Ottawa fire may be of a somewhat revolutionary character. It is in regard to the rebuilding of the mills and factories on the old sites and the manner in which they will be supplied with power to operate them. The mill structures and factory buildings at the Chaudiere Falls, which were destroyed, were most expensive to construct, being built over the water. The development of electricity has obviated the necessity which existed when the mills were erected of locating them in close proximity to the water-wheels which furnished the power. It is quite probable that the entire system of utilizing the magnificent waterpower available at the Chaudiere Falls may be applied to much better advantage than heretofore. A scheme is now on foot with the object of securing the amalgamation of most of the manufacturing interests at that point for the purpose of erecting a great power house where electrical energy can be generated and supplied to industries in the vicinity. The carbide establishments will use considerable of this electric power, and there will be sufficient to also provide energy, at a low enough figure, to secure the erection of new industries.

In the yards of the Atchison, Topeka & Santa Fé Railway, at Ft. Madison, Ia., the switches are lighted by electricity. The switch lamp is of the ordinary pattern, with an incandescent electric light of 8-candle power, fitting a socket inside. The wiring is brought to the switch stand in an underground pipe line, which is tapped by a branch pipe standing vertically 3 or 4 ft. clear of the stand and arching over so as to enter the top of the switch lamp. These lights, according to "The Railway and Engineering Review," are said to be entirely satisfactory, as the attention of a lamp tender is dispensed with and the electric light is safer against extinguishment than the common oil light.

A PRIZE of 1,200 marks (\$300) and a gold medal are offered to the designer of the best system of high-speed and heavy-traffic electric railways. The prize is known as the Veitmyer prize and will be awarded by a committee of the German Society of Mechanical Engineers. The conditions call for plans of a railway connecting two distant cities, upon which trains having a minimum seating capacity of 150 passengers may be operated at frequent intervals at a speed of not less than 200 kilometers (1244 miles) per hour. No intermediate stops are to be provided for. The principal engineering difficulties will be the questions of air resistance and terminal switching, as the electrical details are fairly well worked out already. The contest closes October 6, 1900.

The tenth dynamo in the central station of the Niagara Falls Power Company of this State was lately tested and found to be all right. This dynamo brings the station up to its intended capacity which is 50,000 horse-power. MR. M. W. CREAN, superintendent of the Yukon Government telegraphs, and S. B. Charleson, supervisor of Yukon Public Works, are inspecting the telegraph line which is being built northward from Quesnelle to Atlin, B. C., which, when completed, will give the Klondike region direct communication with Vancouver, B. C. Mr. Charleson states that he will have the gap between Quesnelle and Atlin spanned by November.

SWEDEN, of all the countries of Europe, is perhaps most blessed with natural power. From the mountain streams at the head of every fiord a quantity of energy is available, the total being enormous. To this fact the Swedes are rapidly waking up, and imports of electrical machinery for the utilization of these water powers are growing with rapid increments. Electric railways are under contract at Trolhaettan, Gothenburg, Lund, Bjerrod and Joenkoeping. The electric automobile is also achieving considerable popularity in Sweden and other Scandinavian countries, the benzine and gasoline varieties of motor carriages being considered too noisy and far to evil smelling fothose regions.

Advices from Paris state that a large quantity of American machinery has been sold to French buyers since the opening of the Exposition and there is not the slightest doubt that all exhibited will be sold before the close.

GEN. A. W. GREELY, Chief of the Signal Corps, has received a dispatch from Colonel Allen at Manila saying that the Signal Corps has succeeded in laying the cable line connecting the islands of Cebu and Leyte in the south ern part of the archipelago. Leyte is an island immediately south of Samar and north of Mindanao. Cebu is to the west of Lyete. Both islands are large producers of hemp. The Signal Corps has also completed the construction of a telegraph line northward from Manila to Aparri, on the extreme northern coast of Luzon. During Spanish occupancy of the Philippines this land line existed but was destroyed by the insurgents. Its reconstruction wil enable the garrison along the line from Manila to Aparri to keep in touch with both points.

The railway line between Murnau and Oberammergau has been opened, but owing to the bad weather the erection of the electrical equipment has been delayed, and the trains are at present being drawn steam locomotives. It is hoped, however, says the London "Electrician," that the electric installation will be ready before the Passion Play takes place. The line, which is being built by Messrs. Kummer, of Dresden, is 15 miles long, and has several gradients, the largest of which is 3 per cent., extending over a length of nearly four miles.

The aging of timber, which formerly required long storage, is now completed by electricity in a few hours. In the Nodon-Bretonneau process the timber is piled on a lead frame in a large wooden vat, is nearly immersed in a chemical preparation, and is covered over by shallow vessels of water having porous bottoms of felt and linen. The positive pole of a dynamo is connected to the lead frame and the negative pole to the water vessels. On the passage of the current, the sap is driven to one side of the wood and expelled, and the chemical liquid enters the pores and takes its place. After drying the wood is ready for use.

#### BY JEAN WETMORE.

The recent contract let for the equipment of an electric railway line between Detroit and Toledo, capable of maintaining a speed of sixty miles an hour, makes us pause to consider evils to come, and to call attention to the difficulties to be met in attaining so high a speed in an every day schedule.

Much has been said heretofore about the possibilities of high speeds to be obtained by electric cars, and electrical inventors have given many reasons for their faith in the final outcome, while prophecies have repeatedly been made for many years past of the final conversion of the present steam trunk railway lines into electric systems, capable of greater speed, more economy, freedom from dust, and excessive heat in summer, better heating in winter, and improved lighting during the whole year, and without special portable lighting installations. Attention has repeatedly been called to the fact that the circular unidirectional motion of an electric motor is more economical and practically free from vibration at high speeds when compared with a reciprocating steam locomotive. That it requires less complicated mechanism, cheaper construction, and less help at cheaper wages, to run an electric motor, and also if we place the motors under each car of a train, the greater the load, the greater the traction, with only comparatively slight additional weight to each car, is well understood.

Attention has been called to the fact that switch engines may be dispensed with, and that less help and machinery will be required in repair shops and roundhouses, giving a further saving in running expenses and in cost of equipment, and finally that the construction of large units of stationary power in generator stations, equipped with improved automatic stokers, triple expansion condensing steam engines will be far more economical than burning coal in a large number of movable furnaces, as in the present steam locomotive system.

All these advantages appeal to our judgment and chain our attention.

They are by no means new facts; our electrical engineers have been calling our attention to them for years, and yet no steam trunk lines have undergone a conversion to electric traction.

The elevated lines of Chicago have been pioneers in a limited way in a class of work where conditions were most favorable and they have shown encouraging practical results; the Brooklyn Elevated lines followed a good Western example, and have been giving almost as much employment to the Municipal Fire Department firemen as to motormen; the short Brooklyn Bridge line is apparently satisfactory, and a short New England road is said to operate successfully. All these equipments are of slow speeds compared with steam express work.

If good things come slowly, there must be valid reasons for the delay, and the progress of the Detroit and Toledo line as a pioneer in swift surface traction will be watched with interest. This line is of the overhead trolley type, and the first difficulty that naturally presents itself is the knife-like effect on the overhead network of span wires, when a car going at the rate of 60 miles an hour has a trolley wheel slip off the conductor. Unless well thought out provisions to meet this difficulty have been taken, such a result is likely to happen often.

A proper spring regulation at the base of the trolley pole must be provided or very long flashes detrimental to both the wire and the trolley wheel may be expected. As this road is nearly an air line between the two cities, the effect on the trolley wheel and arm in rounding curves at high speeds will probably not be determined. One of the first requirements of this line for successful operation will certainly be a very taut trolley wire, and strong taut spans and nothing save the best of accurate overhead construction, kept in constant good repair, will enable a schedule of 60 miles per hour to be successfully maintained. Speaking in a general way, high electric railway speeds will undoubtedly be better secured through the use of the third rail construction, rather than by the overhead system, as offering more substantial construction and greater freedom from repairs and deterioration. While in our opinion high speeds will necessitate this latter construction for the above mentioned reasons, which also eliminate the difficulties encountered in preserving good electric contact in the excessive swaying of the car at high speeds, or at least it will better enable safeguards to be employed; this difficulty will become less apparent near the trucks than at a distant point on or above the car roof or when electric contact is taken at some appreciable distance above the ground, as at the side of the ear body. My opinion is that the current supply should be taken midway from between the track rails for high speed traction, and that the contacts should be attached to the trucks, and not to the car body, for when attached to the former a more even contact pressure can be maintained to practically eliminate the uneven pressure due to swaving of the car and the action of the car springs, especially when running over uneven track and in rounding curves.

The trucks seldom leave the rails at high speed or inappreciably so, and the distance between the wheel axles and the roadbed is practically constant.

The third rail finds its best insulation on elevated electric roads, and here it can undoubtedly meet with success, but the constant leakage question, when the rail is laid on the ground or spiked to the ties, for long trunk lines will be expensive and we may say prohibitive. Successful insulation indicates no grade crossings and the elevation of the third rail on insulated supports even closely approaching the car axles. These general principles possess common sense and will undoubtedly be found correct in general practice.

The contact wheel, shoe or skate for high speeds is another element to be seriously considered; the contact shoe suspended from knuckle joints, operates successfully on the slow speed Brooklyn Bridge cars, but it would jump about in a reckless manner at a 60 mile an hour speed, while to keep it in close contact with the rail would necessitate considerable pressure, which would create great friction and a very great objectional cutting effect that would preclude durability. The wearing away would be greater than if a brake shoe was left set on a car wheel at a high speed. We would also have a great pyrotechnical display from the combined friction and imperfect electrical contacts at a high speed, which would be very apparent after dark.

A large contact surface may be secured by employing a shoe or skate, but at high speeds we meet with different conditions than are found in present practice.

A rolling contact is good, but it presents a

limited contact surface, which would require a large number of contact wheels to meet the requirements of the necessary heavy amperages to be carried, and a multiplicity of parts would be highly objectionable.

The high speeds require improved contact devices to meet the new conditions.

A very desirable device would be a rolling contact with a multiplicity of contact surfaces. but mathematically the ordinary trolley wheel gives scarcely more than a point which presents high resistance for heavy amperages. The trolley wire or third rail is tangent to the curved surface; if we could secure a wheel that would run flat on the wire or rail and present a multiple contact surface the problem would be solved. Obviously this is quite impossible with a solid trolley wheel, but quite possible with one possessing elasticity. Several years ago the writer invented and patented such a wheel, which secured a multiplicity of contacts with great radiating surface to dissipate the heat, but while it could not meet modern conditions, as then constructed, modifications to meet high speed requirements could possibly be made.

# THE EQUIPMENT OF THE ELECTRICAL ENGINEERS R. E. VOLUNTEER CORPS\*

We reproduce herewith a number of views illustrative of the apparatus taken out to South Africa by the Electrical Volunteers of England.

Burrell's special single-crank compound engines were the first two taken out: they were arranged to be of specially light build, weighing only eight and nine tons, whilst indicating 18 hp.

One of the special features of these engines was the arrangement of the two cylinders, one above the other, the two piston rods working on a single cross-head, to the center of which the connecting rod was attached.

The engines were capable of drawing loads of about 12 tons each, and it was found that they could travel on an average road for about six miles with the water carried on the engine.

For stationary work the water consumption worked out at about 32 lbs. per hour per ehp. developed, which is not a bad result to obtain from an engine of this type, though it was anticipated that after a little experience in handling the engines, the water consumption would go down to about 28 lbs. per hour.

The last engine shipped of the same make was arranged for partial condensation, with a view of further economizing the water.

To enable the engine to run for longer periods, one wagon was used exclusively for carrying additional water and fuel.

As regards the coal consumption, it was found that under ordinary conditions of working between six and eight cwt. of coal was consumed per eight hours a day.

It was found advisable to fit special spring arrangements to the front of the engines, to minimize the jolts transmitted to the dynamo—which was fixed on a bracket on the front of the engine, and was belt-driven off one of the engine pulleys.

The dynamos were of the multipolar semienclosed type, and were designed for 110 volts, 80 to 100 amperes, 750 revolutions per minute.

Finally, the engines, when completed, were entirely roofed over, and by means of water-proof covers dropped from the top they were completely covered in.

These have had to be specially designed,

<sup>\*</sup> From the "Electrical Review," London.

and with the exception of the barrel almost everything is novel. The gun-metal bases revolve in ball-run turn-tables, in the center of which a degree circle is fixed, with a movable pointer to facilitate synchronizing the projectors at a distance.

In this way, if a number of projectors were in position some distance apart, and it was necessary to move their beams simultaneously through the same angle, they would all receive they can be hauled along like an ordinary gun. A draw hook is fixed for pulling a second projector along, and when traveling the projector is usually attached to its limber in front.

A powerful serew brake is fitted which can be worked from the hindermost end when traveling.

Provision is made for attaching to the projector trail an ammeter, voltmeter, and main switch, the latter being normally fixed to the

FIG. 1.—PROJECTOR MOUNTED ON TRAIL, WITH LIMBER.

instructions to set their pointers to the same angle on the dial, so that one command by telephone would be correct for them all. The projectors are fitted on special steel trails, similar to gun-carriages, but fitted with springs. These trails are mounted on wheels from the Royal Arsenal, which ensures their being interchangeable with other wheels in the field.

The projectors may be detached from their carriages, and can then be used as stationary projectors on the ground, their four feet being each separately adjustable for height.

The mirrors, glasses, and divergers are mounted in aluminum; whilst the Coles reflectors are of deposited copper faced with silver, with a thin coat of palladium to prevent tarnishing.

It has been found necessary to entirely remodel the lamp mechanism, the pattern service lamp being far too heavy and clumsy; also, it was feared that the usual arc-striking arrangement would be hammered to pieces by the vibration of the moving carbon when the lamp is traveling about. The new lamp is arranged to lock the movable carbon holder in position, after the arc is struck, the feeding movement being carried out by the shunt coil acting on the other carbon.

As a drop of 52 volts can be allowed between the dynamo and the arc, the searchlights may be situated a mile or more away from each traction engine.

In working the projectors the elevating motion is actuated by means of a worm, and is consequently slow in operation; on the other hand, the horizontal motion, which has to be worked quickly for signaling purposes, is pulled round by hand.

Accuracy is naturally not of so great importance in the horizontal as in the vertical motions

The projectors on their trails can be drawn either by traction engines, mules, or by hand, and for this latter purpose drag hooks have been arranged on the end of the axle, so that

trail. Preparation has, however, been made for fixing them at either end, the ammeter and voltmeter being suspended, whilst holes have been drilled for attaching the main switch.

Fig. 1 shows very clearly the projector mounted on its trail. The instruments are also shown hung in position, whilst in the

ropes. Behind, a flap door was fitted, by lowering which the inside of the box, thoroughly lined with felt, was exposed. The inside of this box was fitted up with shelves, and arranged to carry two projector lamps, two mounted mirrors, one plane glass and one di-

A box was further fitted underneath the seat, access to which could be obtained by lifting the seat, and in which carbons, tools, drag ropes, ammeter and voltmeter were kept.

The driver's seat was arranged to accommodate two persons, and from it a screw brake could be brought into operation.

On the roof itself a variable resistance in its own box was carried, and this resistance could be worked either in this position or it could be taken down and used on the ground.

In passing, attention might be drawn to the extremely suitable design of a resistance of this description for rough work. It consisted of short lengths of solid wire fixed rigidly between asbestos clamps, thus running little risk of short circuiting when the wire became heated and expanded—a trouble frequently met with when coils of wire are used.

#### PORTABLE CABLE DRUMS.

The cable carriages were arranged to carry three drums on each, the center drum being somewhat larger than the other two.

About 200 yards of cable could be carried on each drum, the cable being capable of transmitting about 100 amperes. It was chiefly concentric, with the outer conductor bare, and braided to prevent its unwinding should one section become damaged.

All fittings, such as ammeter, switch, etc., contrary to the usual practice, would be arringed on the outer or earthed wire, which would enable one to do any coupling up without fear of shock.

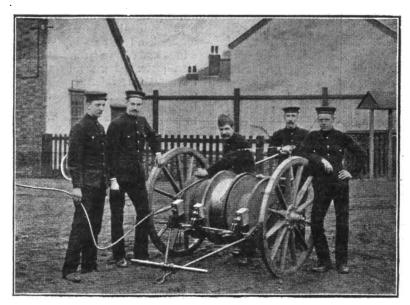

Fig. 2.—Portable Cable Drum.

center is Captain Lloyd, R.E., with his hand on the main switch.

On the right hand side is shown the limber, and on the top the adjustable resistance.

#### LIMBERS.

The limbers consisted of wooden boxes lined with steel, whilst the underframes were built up of angle iron.

They were mounted on springs, the axles and wheels being made interchangeable with those of the projector carriage. They were arranged for draught with mules or traction engine, by using a pole, or for being pulled by hand with

Each drum was prevented from turning at will by means of a brake, whilst the cable was wound up by hand after use.

The wheels and axles were here again interchangeable with those used for the projectors.

The drums could be pulled in either direction, either by means of a traction engine or by hand; when drawn by hand ash handles could be fitted in.

In Fig. 2 is shown the portable cable drum, with an ash handle in position, ready for being bauled by hand.

To facilitate communication 20 cycles bay

been taken out, some with eight inch, others with nine inch cranks. Six of these cycles were fitted with spindles over the back wheel, to which were attached two light cable drums, each holding nearly two miles of fine bare copper wire.

A cyclist can pay this wire out while riding along as fast as he can go, say from eight to fifteen miles per hour.

Small brakes without much friction were fitted on these drums to keep the wire from over-running.

The wire was bare, whilst the earth was used as the return circuit, and it was found that even on wet ground one could telephone up to three or four miles with the wire trodden in the ground, and even broken.

To pick up the wire a handle was attached to the drum, and the cyclist wheeled the bicycle forward with one hand, and wound with his field telephone. The drums mounted over the back wheel of the cycle are clearly seen, and from this picture it will be easily understood how simple it is to lay the telephone wires.

# POOR INCANDESCENT LIGHTING-ITS CHIEF CAUSE AND REMEDY.

BY H. L. MONROE.

There is without doubt great opportunity for improvement in the character of incandescent lighting service given by central stations in the Southwest. Central stations have too long neglected to consider the essentials necessary to a good lighting result. They provide good station apparatus and machinery and competent supervision for the correct operation of the same. They provide proper distributing service, including lines and transformer. When, however, they have made con.

Fig. 3.—Sapper Using Field Telephone; Bicycle Fitted with Cable Drums for Laying Telephone Wire.

the other, the wire being led over a guide on the handle bar, and thence to the drum. It was found that the wire could be picked up in this way as fast as the cyclist could walk, say four miles per hour.

In the event of the wire being badly damaged it would be left on the ground, as, being light, any quantity of spare could be carried.

The telephones themselves were carried on the back of the cyclist, and were of the Swedish cavalry pattern; they could either be used for speaking purposes or the signal might consist of the "buzzer" being used on a high resistance or leaky surface.

These instruments are fitted with a third terminal through a condenser, which enables one to tap an enemy's wire, and hear all that is going on by just laying a wire from this third terminal across the telephone wire, and without in any way interrupting the conversation.

In the same way a commanding officer can listen to any instructions being given by his subordinates.

v. In Fig 3 is seen a sapper in the act of using

nection, with the customer's premises and installed a meter they seem to think their duty is ended. They neglect to consider one essential feature for which the whole lighting plant is operated to supply current, namely, the incandescent lamp. This most important and essential device is turned over to the customer for him to purchase and use as he pleases.

The central station takes good care to provide all necessary apparatus to generate current, but the device that utilizes this current, to produce the substance the station is making and selling—i.e., light—the lamp is entirely ignored and left to the mercies of the public. I desire to point out that this is a mistake.

It should be just as much the part of a lighting company's business to supply a good efficient lamp and renew it when dim as it is to supply current to light the lamp. How can any central station expect to secure good lighting results when the one device which makes the light is not under their control and charge.

You might as well expect to secure good results by putting an inefficient propeller on the shaft of a modern steamship fully equipped with most complete machinery, or to expect an effective service from our modern men-of-war by equipping them with indifferent guns after all other details of construction had been supplied in a most complete and expensive manner. I desire to repeat again that what central stations are making and selling is light. They may supply it by ampere hour, watt hour, lamp hour, or by contract, but what the customer is using and paying for is light. If, therefore, a station has all other essentials and has the most perfect construction and operation, if it fails to give a good service of light it defeats its own object. It is an axiom that none can dispute, that without good lamps properly renewed a good service of light is impossible. So then we see that the lamp, far from being a device that can be ignored and turned over to the customer, is a device that the station should own and control and carefully look after.

The great evil of electric lighting-poor service-is the result of the practice followed by numbers of stations in this section, of charging their customers for their lamps. This practice has arisen as a parallel from gas practice. Because, for example, the gas companies made customers buy their fixtures and burners and tips, the electric light companies concluded that they would charge customers for the lamps. The error of such a conclusion is evident when we consider the difference between the two cases. When the practice was adopted in gas lighting the old tip burner was the only kind used. These burners were mechanical and as long as they were not fouled they gave practically the same results. The quality of light in gas service, therefore, did not depend upon these burners, but on the quality of gas supplied; that is, the gas companies improved their lighting by improving the quality of their gas by work at their central station. It made little difference, therefore, whether the customer or gas company supplied the tip burners, they were practically all the same, and gave the same results throughout life. Mark the difference in electric lighting. Here the results are not dependent upon the service at the station. Barring the matter of regulation, a company cannot do one thing more or less to improve the quality of the light by any work at the station. We can have the same electrolier taking same current from same station dynamo and transformer, and will get totally different results in lighting, according to the type of lamp we install thereon. We see, therefore, that in electric lighting the quality of light is dependent solely upon the burner; that is, the lamp, directly the reverse of gas lighting, so that what is an indifferent detail in gas lighting becomes a very important feature in electric lighting, namely, the control and regulation of the burner or lamp. I may say, parenthetically, that this same point is now coming home to gas companies, with the introduction of the Welsbach burner. Here is a burner similar to the incandescent lamp, on which the result in light depends. We have examples everywhere of the miserable results in lighting service consequent upon the attempt to leave these burners in the hands of the consumer, who never renews them until they absolutely burn out.

Return now to the incandescent lamp. We have seen the error of the practice generally followed in this section. The only effective

<sup>\*</sup> A paper read at the annual meeting of the Southwestern Gas, Electric and Street Railway Association, Waco, Texas, April 13, 1900,

way to overcome the condition is to supply. free lamp renewals. This is possible for every central station with their meter customers, and as it is generally the desire of all stations to adopt meters, this change to free renewals should go hand in hand with the change of charging service to the meter basis. As long as a customer is charged for his lamps. two conditions will prevail. If the lamps are not sold cheap enough by central stations, many customers will buy any other lamp which they can get cheaper. The only features by which an average customer can select a lamp are cheapness and long life, two features which invariably secure them the poorest type of lamp.

If central stations are to charge for lamps, then the price should be made so low that customers would have no inducement to buy elsewhere than from the station. If this is not done, the circuits are bound to be loaded with lamps of various types and shapes, varying candle powers and varying wattages. The lighting service will be mixed, low candle power contrasting with the high candle power, to the great dissatisfaction of the customers and prejudice of good lighting service. Meter bills will be uncertain and high as a result of varving wattages of lamps, and complaints will be frequent and allowances unavoidable. In this day, Lowever, when so many cheap lamps are flooding the n.arket, and the repaired product of certain lamp manufacturers is sold as low as 10 cents, it will be seen that central stations will have to reduce the price of lamps very low in order to control the supply. It would be a much better plan for the central station to cut the "Gordian knot" at once by supplying lamp renewals free of charge, and place the lamp in the same category as the transformer, a piece of apparatus owned and controlled by the central stations.

As long as a customer is charged for a lamp. even though it be but five cents, he will continue to use it until it is black in the face, dim and useless. The central station will be powerless to overcome such a condition, and the results of the best operated station will be nullified by old and dim lamps retained too long in service. It has been tried in numberless cases to urge customers to renew their lamps. by circulars, postals, and inducements of every kind, but to no avail. The amount of money and time wasted in such attempts is much better spent in the direct and effective method of free renewals. The condition is simply this: The quality of incandescent lighting service depends directly upon the lamp. All lamps deteriorate after a certain number of hours' service and some makes in a greater degree than others. If lamps are not renewed, therefore, the lighting service is bound to deteriorate in the same degree as the lamp. Repeated experience has shown that customers will never renew their lamps when charged for them, except when they are burned out. It therefore follows positively that as long as lamps are sold to the customer the deterioration in lighting service cannot be properly repaired. An old proverb says, "It is necessary to break eggs to have an omelet." It is equally true that in lighting service, you must break lamps to have good light. A given number of kilowatt hours' service requires a fixed number of lamps to be used, taken out and broken up. If any less number is used the lighting service has deteriorated correspondingly. We all remember the story of the man who boasted that he had gotten his horse down to eating but three oats a day, when the animal died. A parallel is found with electric lighting companies that endeavor to shift the responsibility on to the customer, and cut down the number of lamps used to practically nothing. If the service is not properly fed with new lamps it is sure to languish and suffer. The only objection to be urged against the free renewal policy is the expense of it. The question is asked "Can a station afford the expense?" That I can answer most positively "yes," for all meter customers. The real question is not whether central stations can afford this policy, but whether they can afford to do without it. In these days of Welsbach burner competition, and the Kitson, and other new forms of oil lamps, with Welsbach burners, electric lighting companies certainly need to take some steps toward an effective improvement in their lighting. The lamp costs but a small fraction of the cost of the current to light it. The other expenses are from ten to twelve times the cost of the lamp. It is certainly foolish to attempt to save on the one-tenth which the lamp costs, and thereby destroy the value of the remaining nine-tenths. How much better to expend the one-tenth by free renewals, and thereby secure the full value of the remaining nine-tenths. The actual cost of free renewals will average about one-half to two-thirds cent per kilowatt hour, and if stations wish to be reimbursed, they can increase their meter rates accordingly, or adopt free renewals in place of any reductions in rates. There ought to be little difficulty in central stations obtaining slightly increased rates for the great improvement of service which the free renewals will secure. Aside from this, however, central stations can afford the step, whether they are to be reimbursed for it or not. In the first place, if free renewals make it possible to improve the lighting service fully 50 per cent., certainly two-thirds cent per kilowatt hour is a small price to pay for the improvement. Such advancement means increased business, customers better satisfied, absence of complaints and allowances, and maintenance of better rates. No such slight expense should be spared which will make electric lighting so good that no one needing light can very well afford to be without it. I wish to urge upon central station management the importance of having an incandescent lamp department, which will be responsible for the superintendence of lamps and conditions of lighting service. Adopting free renewals, the central stations should make it their business to look after the lamps and conditions of lighting service. Experience has shown that they cannot depend upon the customer to renew them properly even when they are furnished free. Besides, attention to this detail pleases the customer, and electric lighting is bound to be more popular when all a customer is required to do is to pay his bill and turn his switch, and the lighting results are always ready, and invariably good without any further trouble on his part.

The best methods of looking after lamps are as follows:

1. Periodically remove all lamps from the circuits one to four times per year, according to the conditions, and replace them with new ones. Photometer the lamps removed, and save those measuring above a prescribed limit (say 13 cp.) for use at high voltage points, or locations where reduced candle power is of slight importance. Scrap the remaining lamps.

2. Give a new lamp in exchange for an old one for, say, every \$3 worth of current supplied, or for any fixed amount determined by the meter rates and conditions.

The second plan is an excellent one, in that it offers a bonus for the use of current and regulates renewals on the correct basis of number of hours of lamp service. It can be profitably adopted wherever meters are in use. A station attendant should visit customers quarterly, and install the number of new lamps due each, removing and returning to the station an equal number of old lamps. If station attendance is limited, a lighting company can fill out, and mail to their customers, each quarter of the year, blanks similar to the fol-

Due to Mr. .... .....16 candle-power lamps, for the quarter year ending ...... which is on the basis of one lamp for every \$3 worth of current supplied.

Present this slip at the station or office.

\*\*\*\*\*\* \*\*\*\* \*\*\*\*\*\*\*\*\*\* Summing it up, therefore, we find that to have good lighting service, it is necessary (1) that incandescent lamps be supplied by central stations free of charge to the customer, and (2) that these lamps be periodically renewed so as to weed out the dim lamps, and keep the service bright. That such a system pays most handsomely has been found to be the experience of every central station adopting it. It is the practice of the leading stations to-day, and it has done more than anything else to successfully build up the lighting business of the United States. The opposite policy is responsible for the very poor and miserable lighting service to be found abroad on the Continent of Europe. Nothing is more important, vital and essential to the well-being and success of all electric lighting. One of the leading officials of the United Gas Improvement Company at Philadelphia recently instructed one of the largest properties using over 100,-000 lamps a year, to furnish lamp renewals free, and gave it as his opinion that only by free renewals can an electric lighting service be properly maintained. Experience has given most positive evidence on this point. Free renewals is the policy of the leading electric stations, and station after station in the East and South are gradually coming to this liberal policy, by which they can control directly their own lighting results, instead of permitting the customer to buy the lamp, and thereby balk all efforts of the station to secure good lighting.

Now, gentlemen, here is the condition confronting you-it is not a theory. The incandescent lighting service of every station in this section is capable of much improvement. It does not answer the question nor solve the difficulty to put the blame on the customer, because he does not renew his lamp. He does not and cannot understand the essentials of a lamp, and invariably blames the company for his poor results. You only pile up trouble and poor returns for yourself by endeavoring to make the customer, from whom you derive your income, responsible for the character of your service. Some other standard than "a customer's kick" should prevail. I earnestly recommend the early adoption of free lamp renewals by all stations with their meter customers. It improves lighting results more promptly and directly than any other department of central station service. It assists the stations to increase their business, and hold their old customers in a way nothing else can. It is a wise and profitable policy, and one that

all lighting companies should follow. With your contract customers, sell lamps, if you will, but sell at a low price, low enough to induce the customer to buy all his lamps at the station, and thus exclude the cheap and worthless lamps.

With your meter customers, however, adopt free lamp renewals, and be able to control and regulate your lighting results, and make electric lighting so good that no one can afford to do without it.

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended May 12:

Antwerp, 37 packages, \$3,688; Australia, 598 cases, \$61,989; Barcelona, 7 cases, \$239; Brazil, 332 packages, \$13,704; British East Indies, 9 cases, \$460; British West Indies, 16 packages, \$1,829; Central America, 18 cases, \$230; China, 39 cases, \$4,167; Cuba, 11 cases, \$489; French Possessions in Africa, 6 packages, \$289; Havre, 194 packages, \$10,226; Hong Kong, 45 packages, \$3,000; Hull, 6 packages, \$450; Japan, 3 packages, \$65; Liverpool, 212 packages, \$28,824; London, 21 packages, \$1,749; Marseilles, 50 packages, \$300; Mexico, 167 packages, \$3,775; Newfoundland, 4 cases, \$33; New Zealand, 3 cases, \$105; Nova Scotia, 3 cases, \$60; Peru, 36 packages, \$2,377; Porto Rico, 4 packages, \$980; Southampton, 88 cases, \$3,737; St. Petersburg, 8 packages, \$250; Tasmania, 5 cases, \$400; U. S. Colombia, 4 cases, \$373; Venezuela, 50 packages, \$919.

## Fine Showing of Strength.

The forty-ninth annual statement of the Phœnix Mutual Life Insurance Company of Hartford, Conn., like all the statements of the company for years past, is gratifying to the managers and policy-holders. It shows assets, at conservative valuation, amounting to \$12,-259,291 and a surplus of \$540,276, beside a special reserve fund of nearly \$150,000, which is also practically surplus. The strength of the Phœnix Mutual is well established and universally recognized, and its investments are of the highest class. They have increased about \$600,-000 during the year, mostly in loans on first mortgages of real estate. The real estate owned by the company is somewhat less than a year ago, which means that it has sold more than it has taken in. The company's new building in Hartford is one of the features of the city. It was put up before the recent rise in building material, but has all the latest inventions and improvements of modern construction and is a model of convenience and attractiveness.

A few suggestive figures of growth are given in the statement. In the past three years the policies in force have increased from 28,269 to 35,512, and the insurance in force from \$46,021,069 to \$57,985,510. The new insurance last year was \$15,547,421. Since its organization the company has paid its policy-holders more than \$40,000,000. In recent years it has come forward into a prominent position among the life companies of the country and is known for its financial strength and the energy and success of its wide-awake management.

## Proposals Invited.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until May 22 for furnishing the Mare Island, Cal., Navy Yard with one generating set.

#### ENGLISH ELECTRIC SHUNTING LOCO-MOTIVES.

#### BY FRANK C. PERKINS.

What is known in American railway practice as an electric locomotive for switching freight cars, and in steam railway work is termed a switch engine, is called on English railways a "shunting" locomotive.

An electric shunting locomotive, of the type

ary power plant, there is probably no method of obtaining motive power more conveniently and economically than by the addition of an electric generator, and the construction of an overhead trolley system. The electric generator which was installed in this plant was of the Manchester type, and designed for 100 volts and 54 amperes at 1,100 revolutions per minute, and is driven off the main shafting in the works. The current is conveyed from the

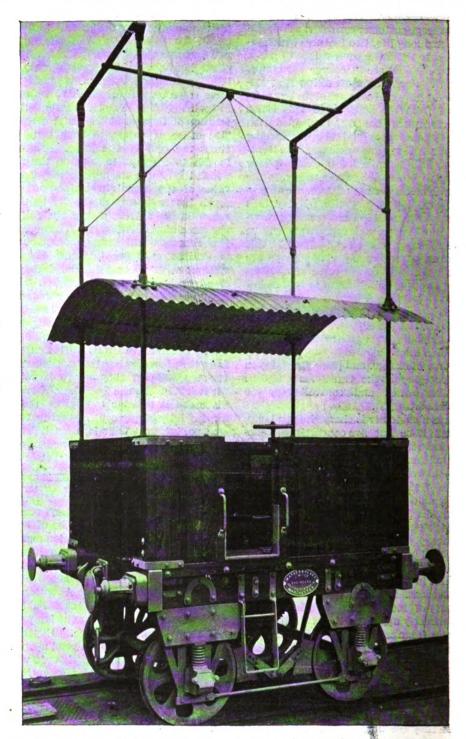

FIG 1.—ELECTRIC SHUNTING LOCOMOTIVE USED AT ENGLISH TEXTILE PLANT.

shown in Fig. 1, has recently been placed in service at the textile machinery works of Tweedales & Smalley at Castleton, and has been giving excellent satisfaction. It is used for switching cars on the siding connecting the boiler house and delivery stores of the textile machinery works with the main line. Although the service is light, it is hardly necessary to point out that, were it required, a locomotive of much greater capacity could be provided; and wherever locomotive power is needed at private works possessing a station-

generator in the usual minner to the overhead wires, and returns through the rails, which are bonded with copper strips and rivets. The locomotive shown in the intustration was constructed by Messrs. Mather & Platt, Limited, of the Salford Iron Works, and somewhat resembles the ordinary goods wagon used in the English works. The driving motor is also of the Manchester type. It is mounted on a cast-iron bed plate, which slides on cast-iron brackets bolted to the frame of the car. A vulcanized fiber pinion is used having 21 teeth

and having on the ends steel end plates. This pinion gears with a cut cast-iron wheel of 72 teeth on the gudgeon shaft, on which is keyed a chain pinion of 7 teeth, driving a chain wheel of 22 teeth. The latter is split into two halves, and is fitted to one axle of the locomotive. The car has coil spring buffers, also axle boxes and guides, and a hand screw brake with brake blocks of wood bearing on the 28" wheels. Wrought iron pillars extend through the corrugated iron roof, and carry the col-

tinually kept fired up, while the generator can easily be started by throwing the power on the machine from the main shafting. The same generator is used for operating the threeton electric crane, usually in operation, and hence the locomotive may be used at any time.

The electric shunting locomotive, shown in Fig. 2, was built by the same firm for a large iron works in Sweden, and is designed to draw a load of nearly 100 tons at a maximum speed of four and one-half miles per hour. The

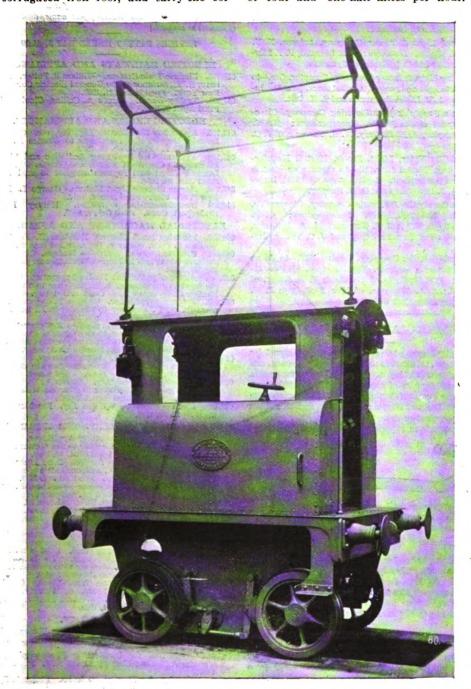

Fig. 2.—English Electric Shunting Locomotive Used at Swedish Iron Works.

lector bars. This locomotive weighs about three tons and the controlling mechanism consists of a main switch and a rheostat for starting and regulating the speed, and also a reversing switch.

The system of collecting the current on this line is peculiar, and consists of two wroughtiron bars located about 6 feet apart, one of which is always rubbing on the under surface of the trolley wire. This system is also used on a more extended scale on the Douglass and Laxey Electric Tramway. As this locomotive is used usually only two or three hours per day it is said to effect a considerable saving over a steam locomotive, which would have to be con-

voltage in this line is 300 to 330 volts. The side frames of this locomotive are steel, and the wheels are 27" in diameter with a wheel basis of 4'6" long. The design of the cab is similar to those made by the same firm for the City and South London Railway. The motor used on this locomotive is of the double armature type made under the patents of Drs. J. & E. Hopkinson. The armatures are connected to the axles by means of spur gear, ten to one. As will be noticed in the illustrations the overhead collecting gear is similar to that of the locomotive previously described, except that the height is in this case about 16 feet from the ground. All of the working parts and the

controlling mechanism are boxed in on account of the heavy falls of snow experienced in the winter season in Sweden.

#### **ELECTRICAL CONDUCTORS AND DIRT.\***

#### BY A. A. CAMPBELL SWINTON.

Everyone must have noticed how electrical wires and fittings gather dust. Hot-water pipes have a similar tendency, and for a long time I was of the opinion that the action was similar in both cases, and was due to air currents produced by heat. Recently, however, I have had reason to alter my views, and the matter appears to be of sufficient interest for detailed description.

In a new office I have now occupied for five months there are in my room five plain pendant fittings. As the ceiling is of concrete, and as it was necessary not to disturb the tenant above, these pendants all consist of plain flexible cords of the usual twisted pattern, which start from ceiling roses on the wall near the cornice, and are led through insulated eyes across the ceiling to the points from which they hang. The supply is the continuous-current supply of the Westminster Company at 200 volts. Three of the pendants are upon one switch, the other two being upon another switch. Of the set of three, two are of 16 cp, one of 32 cp. I mention this latter fact, though it has nothing to do with the phenomenon observed. All the lights in practice are used at once, so that in this respect the conditions are the same in each case. The following, however, are the results, which are sufficiently remarkable to deserve notice.

Within a week or two of my entering into occupation of the office and using the lights it was observed that, whereas the three flexible cords connected with one switch remained clean, the two cords on the other switch were rapidly accumulating dust. The latter were repeatedly dusted, but the effect always repeated itself. At present, after some five months' use, while the one set of three cords is still comparatively clean, never having teen dusted, the other set of two cords is thickly covered with an aggregate of dust particles, which in some places project fully one quarter of an inch from the cord. Further, while the plaster of the ceiling in the case of the set of three cords is absolutely white, and the ceiling roses at the ends of these cords retain their original color, the ceiling immediately above the set of two cords is blackened with a well-defined broad dark line, while the ceiling roses that serve these two cords are also covered all over with a dark deposit.

Now for the reason of this strange phenomenon. It is very simple. In the case of the set of three pendants the flexible cords and ceiling roses of which do not become dirty, the switch is in the positive pole. In the case of the other set of pendants, whose cords and roses become covered with dust, and which even blacken the ceiling with which they are not in contact, the switch is in the negative pole. Now, as is well known, the negative conductor in the street mains has a tendency to earth itself to an extent which is sufficient to cause the negative lead to be almost always at the same potential as earth. Consequently, the positive conductor is always at nearly 200 volts potential above that of earth, and therefore above that of the dust particles present in the atmosphere. This point has been tested in my office with a volt-

<sup>\*</sup> From the "Electrician," London.

meter, with the results that from the negative there are only about 30 volts to earth, while from the positive there are 170 volts to earth. The reason for the effects observed is thus obvious. In the case of the three pendants, whose switch is in the positive, it is only when the switch is turned on a few hours per diem out of the 24 that there is any appreciable difference of potential between the cord and the surroundings. Even then it is only one conductor in the cord that has this potential, and the exterior of the covering very possibly always retains zero potential. In the case of the other set of two lamps, whose switch is in the negative, the result is far different. When the switch of this set is turned on, no doubt the conditions are similar to the other set when the latter's switch is also turned on. But during the many hours every day when the switch is turned off, in the case of the two-light set both of the conductors remain constantly at a potential 170 volts above that of its vicinity The dust is therefore caused to deposit upon the cord and upon the ceiling rose by electrostatic attraction. No doubt the use of 200 volts. which will give four times the attraction afforded by 100 volts, has made the effect more marked in this particular case.

I should not have thought it worth while bringing the above facts forward publicly had they not been so marked as to be a serious nuisance in the case of the pendants whose switch is in the negative. From the point of view of the wiring of decorated rooms in a town with an atmosphere like London the matter is of very considerable importance. It will be found that with the switches in the negative, an amount of dirt will be deposited in a few weeks that would take years to accumulate with the switch in the positive. I am well aware that from a totally different point of view, in damp situations, there is an advantage in putting the switch in the negative, for the reason that otherwise the metallic mechanism of the switch is liable to be corroded away by electrolytic action. In dry places, however, where it is desired to keep electrical wires and fittings clean, I have no doubt that in an atmosphere such as we have in this great city, switches should always be placed in the positive conductor, so that the exteriors of such fittings and wires should remain as far as possible at earth potential.

#### LEGAL NOTES.

A complaint has been entered in the United States Circuit Court in which the Electric Cable Construction and Maintenance Company of Philadelphia, Pa., charges the National Conduit & Cable Co., of this city, with an infringement on a patented improvement in leadcovered electrical conductors, the patent being owned by the complainant company. The complainant asks for an accounting and payment of the moneys accruing from the alleged infringement, and for a perpetual injunction against the defendant.

#### PERSONAL MENTION.

Mr. Timothy L. Bosart, vice-president of the Jenney Electric Manufacturing Company of Indianapolis, Ind., recently died of heart disease.

Mr. H. A. Carriveau of Montreal, who is extensively interested in electrical improvements in Canada, has been in this city for some days negotiating, it is stated, with large el etrical corporations for the establishment of several new lines of electric transportation in various parts of Canada.

Mr. G. F. Sever was recently appointed superintendent of electrical exhibits at the Pan-American Exposition to be held next year at Buffalo, N. Y.

#### INCORPORATIONS.

The Citizens' Light. Heat & Power Company, Waterloo, Ia. Capital stock, \$100,000.

The Osborne Electric Railway Equipment Manufacturing Company, Auburn, N. Y. Capital stock, \$250,000.

The Winnebago Traction Company, Oshkosh, Wis. Capital stock, \$650,000. Incorporators: H. I. Weed, George W. Athearn and M. H. Eaton.

The Varney Electrical Supply Company, Indianapolis, Ind. Capital stock, \$30,000. Directors: Gordon E. Varney, Arthur V. Brown and Charles O. Britton.

The Zenith Electric Light Company, Chicago, Ill. Capital C. W. Buckley, Lewis J. stock, \$15,000. Incorporators: Osborn and William G. Husband.

The Citizens' Light & Power Company, Auburn, N. Y. Capital stock, \$30,000. Directors: G. B. Leonard, F. T. Pierson, T. H. Mather and C. D. Beebe, of Syracuse.

The Sumpter Light & Power Company, Sumpter, Ore.-to furnish electric light and power. Capital stock, \$50,000. Incorporators: A. C. Little, E. Cannon and S. H. Belt.

The Electric Supply & Manufacturing Company, Cleve land, O. Capital stock, \$50,000. Incorporators: H. W. Jones, C. H. Taylor, F. R. DuGuay, W. H. Turner and F. C. Hofemiester.

The Mound City Water, Light, Power, Heat & Manufacturing Company, Mound City, Ill.-to operate an electric light, heat and power plant. Capital stock, \$60,000, Incorporators: A. J. Dougherty and O. M. Murphy.

The Fulton County Gas & Electric Company, Gloversville, N. Y. Capital stock, \$1,500,000. Incorporators: G. E. Spencer, Brooklyn, N. Y.; J. B. Summerfield, A. Mathews, H. C. Everdell, all of New York City, and J. C. Young, Jer-

The Machado & Roller Company, Esopus, N.Y.-to do an electrical engineering business. Capital stock, \$10,000. Incorporators: J. E. Machado, of Plainfield; F. W. Roller. of Roselle, N. J.; A. A. Whilman, of New York City; F. W. Yates, attorney, New York City.

#### COMMERCIAL PARAGRAPH.

The Donnelly Improved Steel Climbers, manufactured by J. J. Reidy & Co., 311-315 East street, New Haven, Conn., are not an experiment, as they have been tested for two years by experienced linemen of the Western Union Telegraph Company, the Postal Telegraph Cable Company and the Southern New England Telephone Company, and have been adopted by these companies,

They are made from a special steel that is manufactured

solely for that purpose, and possess great strength without unnecessrry weight, making them easier and safer to climb with than the old style, as the following testimonials will at-

New York, April 6, 1899.

About five months ago I secured a pair of your Improved Donnelly Climbers. They have been in constant use ever since by Lineman J. Keefe, who states that they are safer and more easy to climb with than any climber he has everused. A number of our men are now using your climbers, and all speak highly of them. Yours truly,

T. J. JENNINGS. Foreman of Construction Postal Telegraph Cable Co.

New Haven, May 5, 1899.

The J. Donnelly New Improved Climbers are in use by nearly all of the linemen employed by this company. I can cheerfully recommend them for strength and durability

J. W. LADD.

Supt. Construction The Southern New England Telephone Co. The following are a few of the well-known firms who buy Donnelly's Improved Steel Climbers: Western Union Telegraph Co., Postal Telegraph & Cable Co., J. H. Bunnell & Co., The J. Jones & Son Co., Manhattan Electrical Supply Co., Morris Electric Co., Patterson Bros., Stanley & Patter son, Western Electric Co., of New York City: New York & Pennsylvania Telegraph & Telephone Co., Elmira, N. Y.; Roe & Conover, Newark, N. J.; National Electric Supply Co., Washington, D. C.; James McGraw, Tower Binford Electrical Co., Watkins-Cottrell Co., Richmond, Va.; Edward Lovell's Sons, Savannah, Ga.; A. Baldwin & Co., New Orleans La.; Electric Gas Lighting Co., Boston, Mass.; Pelcher & Loomis Hardware Co., Providence, R. I.; Congdon & Carpenter Co., Bridgeport, Conn.; L. L. Ensworth & Co., Hartford, Conn.; N. T. Bushnell & Co., C. S. Mersick & Co., New Haven, Conn.; The Henry Walker Co., Norfolk, Va.; Manufacturers & Inventors' Electric Co., New York City; Doubleday Hill Electric Co., Pittsburg, Pa.; Carter & Gillespie Electric Co., Atlanta, Ga.; Erner & Hopkins, Columbus, O.; Walbridge & Co., Buffalo, N. Y.

#### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHRL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents. Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon paymt of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED WAY 8, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

648,995. Electric-Train System, William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 31, 1898.
649,235. Trolley-Wheel. James A. Collins, Cincinnati, O. Filed April 3, 1899.

#### ELECTRIC LIGHTS AND APPLIANCES.

105. Apparatus for Electric Lighting, etc. Osborn P. Loomis, Depew, N. Y., assignor to Charles M. Gould, Buffalo, N. Y. Filed Feb. 15, 1899.
182. Apparatus for Producing Radiation and Light by Electricity. Charles H Stearn and Charles F. Topham, London, Eng.; said Topham assignor to said Stearn. Filed Jan. 20, 1899.
250. Marine Electric Light Fixture. George L. Martin, New York City. Filed Dec. 4, 1899.
105. Harvey. Hubbell, Bridgeport, Conn. Filed Oct. 9, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

648,039. Electric-Circuit Closer. Harrison H. Fowler and William F. Pack, Waverly, Tenn. Filed Dec. 29, 1899.
648,951. Electric Switch. Augustus Hanson, Chicago, Ill., assignor of one half to John H. Goehst, same place. Filed Way 21, 1800.

Alternating-Current Motive Apparatus. Charles P.

649,006. Alternating-Current Motive Apparatus. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Aug. 16, 1897.
649,007. Frequency-Indicator. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 9, 1899.
649,008. Frequency-Indicator. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Original application filed Jan. 9, 1899.
649,015. Current-Interrupter. Elibu Thomson, Swampscott, and Robert Shand, Lynn, Muss., assignors to the General Electric Company of New York. Filed March 8, 1900.
649,179. Transformer Secondary. Adolph F. Rietzel, Lynn, Mass., assignor to the Thomson Electric Welding Company, same place. Filed Sept. 23, 1899.
649,189. Electric Switch. William Ely, Providence, R. I. Filed April 29, 1898.

Filed April 29, 1898.

#### TELEPHONES AND TELEPHONE APPARATUS.

TELEPHONES AND TELEPHONE APPARATUS,
648,977. Signal for Selective Calling Appliances, Frank R. McBerty, Evanston, Ill, assignor to the Western Electric Company, Chicago, Ill. Filed Sept. 14, 1898.
648,978. Signaling Apparatus for Telephone Lines. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed June 7, 1899.
649,088. Spring-Jack for Telephone-Switchboards, Frank R. McBerty, Downer's Grove. Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Jan. 26, 1898.
649,069. Supervisory Signal for Telephone-Lines. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed June 17, 1898.
649,076. Supervisory Signal for Telephone-Switchboards. Charles F. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed April 23, 1896.
649,077. Station Appliance for Telephone Toll-Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 21, 1898.
649,078. Signal for Telephone Trunk-Lines. Charles E. Scribner, Chicago, and Frank R. McBerty, Downer's Grove, Ill., assignors to the Western Electric Company, Chicago, Ill. Filed May 21, 1898.
MISCELLANEOUS,

#### MISCELLANEOUS.

648,019. Electric Telegraph Apparatus for Use on Cable or Other Lines. Sidney G. Brown, Bournemouth, Eng. other Lines. Sidelled June 6, 1899.

1 June 6, 1899. Apparatus for Duplicating Phonograph-Records, nas A. Edison, Llewellyn Park, N. J. Filed Oct. 28,

Thomas A. Edison, Llewellyn Park, N. J. Filed Oct. 28, 1899.
649,003. Envelop for Storage Batteries. Elmer A. Sperry, Cleveland, O. Filed Oct. 7, 1899.
649,031. Electromagnet. Samuel M. Young, New York City, assignor, by mesne assignments, to Harvey J. Donaldson, trustee, Ballston, N. Y. Filed Jan. 7, 1892. Renewed Jan. 10, 1894.
649,086. Electromagnetic Coil. Richard Varley, Jersey City, N. J. Filed Jan. 2, 1990.
649,102. Telegraphic Receiving Instrument. Nicolas Flech-tenmacher, Bucharest, Roumania. Filed Aug. 3, 1898.
649,138. Electromechanical Typewriting System of Inter-communication. Albert D. Neal, Boston, and Howard F. Eaton, Quincy, Mass.; said Eaton assignor to said Neal. Filed Aug. 15, 1899.
649,234. Electric Bell-Striking Apparatus. Lorenzo D. Tillyer and Edward D. Tillyer, Dover, N. J. Filed Nov. 17, 1899.

1899.
649.349-649.350. Galvanic Battery. Clark M. Pratt, Waterbury, Conn, assignor to the Waterbury Battery Company, same place. Filed July 29, 1899.
649.351. Ground-Plug for Electrical Switchboards. Wallace I. Stockdon, Orange, Va. Filed Feb. 16, 1900.
649.385. Apparatus for Making Phonogram-Duplicates. Henry G. Wolcott, Fishkill-on-the-Hudson, N. Y. Filed July 25, 1899.
649.388. Lightning-Arrester Alexander J. Wurts. Pittsburg.

July 25, 1899.
Jass. Lightning Arrester. Alexander J. Wurts, Pittsburg,
Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed June 8, 1899.
Jass. Primary Electric Battery. Victor J. Busson, Paris,
France. Filed Nov. 18, 1898.

## GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Atlantic Highlands, N. J.—In view of the increasing demand upon the electric light plant here the system will be duplicated as soon as possible.

Beaver Falls, Pa.—This town will erect its own electrie lighting plant.

Bentonville, Ark.—The city council is discussing the question of building an electric light plant.

Bloomfield, Ind.—M. L. Coombs and others have secured a franchise at this place for an electric light

Brooklyn, N. Y.—The Armory Board at a recent-meeting awarded a \$250 contract for installing electric light wires and connections in the Fourteenth Regient, rifie range, to Charles Hart.

Centralia, Wash.—The city council is discussing the advisability of purchasing a new dynamo for the electric light plant.

Clarinda, Ia.—This city intends to install an electric light plant in connection with the waterworks. W. E. Keller is engineer.

Columbus, O.—A resolution has been introduced into the council to issue about \$200,000 in bonds for a municipal electric light plant.

Dudleyville, W. Va.—Electric lights are to be one of the improvements at this place.

Glenwood, Ia.—The Glenwood Canning Company will put in an electric plant of its own.

Glenville, O.—This city will erect a new electric light plant this summer.

Horseheads, N. Y.—The board of trustees has decided to ask the firm of Knight & Hopkins, electrical engineers of Rome, N. Y., to make a preliminary estimate of the cost of a suitable electric light plant. When their figures have been received the proposition for the village to bond itself for this improvement will be submitted to a vote of the traverure. submitted to a vote of the taxpayers.

Ishpeming, Mich.—This city may vote on the instal-lation of a municipal electric light plant.

Keswick, Cal.—A. B. Kanaga, of San Francisco, contemplates the erection of an electric light and power plant at this place.

Lyons, N. Y.—The New York Central is planning the installation of a steam heating and electric lighting plant for the Lyons yards.

Marshall, Ill.—The people of this place have voted to issue \$40,000 in bonds for erecting an electric light plant and waterworks. Charles A. Purdurne, mayor.

Meridian, Miss.—The Meridian Mill & Elevator Company will increase its capital from \$15,000 to \$20,000, and build an electric light plant in connection with its mill.

Minocqua, Wis.—J. Woodlock of Merrill contemplates the erection of a new electric light plant at this place in the near future.

Mt. Pleasant, Is.—An electric light plant to cost about \$13,000 will be built here this summer.

New Bedford, Iil.—The erection of an electric light plant is contemplated here.

Norfolk, Va.—W. D. Pender, resident manager of a company of Philadelphia capitalists, has bought a site, and will begin the erection of an electric light plant here to cost \$150,000.

Philippi, W. Va.—The voters of this place have de-ided to issue bonds to erect a municipal electric light plant.

Ruston, La.—This city will hold an election this month to vote on the issuance of \$25,000 of bonds for an electric light plant and waterworks. J. W. Jones, mayor.

Schoharie, N. Y.—This village is to be lighted by electricity.

Seattle, Wash.—J. Leary, one of the promoters of the new electric railway now in process of construc-tion between this city and West Seattle, was lately granted permission to construct an electric light plant at West Seattle.

Springfield, Ky.—J. W. Lewis, W. C. McCord and J. C. McElroy are the stockholders of the new company organized here for the purpose of erecting an electric light plant.

Statesville, N. C.—At a recent meeting of the board of aldermen it was decided to enlarge the electric light

St. Peter, Minn.—This city will add a new 200 light dynamo and engine to its present municipal electric light plant. H. A. Hildebrant is superintendent of the plant.

Thorntown, Ind.—The municipal ownership of the electric light plant has been favorably voted on by the citizens of this place.

Teronto, Oat.—Bids are asked until June 1 for lighting this city for five or ten years from January 1, 1901. Address E. A. MacDonald, chairman.

Troy, O.—The people of this place have voted to issue

bonds for the purpose of erecting an electric light

Washington, D. C.—Sealed proposals will be received at the office of the District Commissioners until 12 m. May 19 for lighting the public streets, avenues, alleys and roads in the District of Columbia during the year ending June 30, 1901, with gas, electric incandescent and arc lamps.

#### STREET RAILWAYS.

Aurora, Ill.—U. P. Hord of this place, T. Snow of Batavia, J. H. Miller of Geneva, W. Hartsburg of North Aurora, and F. Y. Keator, of Chicago, are the incorporators of the new Aurora, Batavia & Geneva Electric Railway Company. The capital stock is \$10,000. It is the intention of the company to build a railway from Aurora to Geneva on the east side.

Augusta, Me.—The electric line from here to Togus is said to be a certainty.

Coldwater, Mich.—The right of way for an electric line from Battle Creek to this place has been secured as far as Union City. It is proposed to build the road

Ditroit, Mich.—A company will be formed by William Canham and J. B. McIllwain of Port Huron to build the proposed Port Huron & Lexington Electric Railroad.

Easton, Pa.—This city and the Moravian town of Razareth are to be connected by trolley. The Easton Consolidated Electric Company, which is controlled by Philadelphia capitalists, and a number of Easton business men are back of the movement.

Frankfort, Ind.—W. Pohlman of New York, representing an Eastern syndicate, was recently in this city to investigate the feasibility of building an electric line from Lafayette to this place and other points, and to install an electric car service for this city.

Grand Haven, Mich.—The Grand Rapids, Spring Lake & Grand Haven Transit Company, of which J. R. Whiting of St. Clair is the promoter, has been incorporated to operate an electric road.

Lancaster, Pa.—Rights of way for an electric railway between here and Ephrata, a distance of 15 miles, have been secured and work on the road will begin soon. The road with equipment will cost \$300,000.

Louisville, Ky.—The Louisville Bailway Company has decided to build an electric line to Riverview Park. The improvement will cost \$20,000.

Moodus, Conn.—A trolley road from here to East Hampton, a distance of seven miles, is the latest pro-ject being talked of in which Bridgeport capital is said to be interested to the extent of upwards of \$75,000. The main object of building the road is said to be for the purpose of hauling freight to the Moodus manufac-

New York City.-The State Board of Railroad Commissioners has approved the application of the Kings-bridge Bailway Company of this city to use under-ground and overhead currents of electricity as motive power on portions of its road, also for the Fort George and Eleventh Avenue Railroad Company to use an un-derground trolley.

Sanilac Center, Mich.—W. C. McArron, a projector from Detroit, has asked the council here for a franchise, and guarantees the road to be running by September 1, 1991. The road will reach this place via

Springfield, O.—The National Traction Company, which will build an electric line from Columbus to Indianapolis, made-application through N. H. Albaugh, of Piqua, for a franchise through Clarke County. Chas. W. Mackey is at the head of the project.

Tyrone, Pa.—A charter for an electric railway here has been secured. The road is to run from Birmingham to Glazerville, through this place.

### COMPANY MATTERS.

Canton, O.—The Canton-Massillon Electric Railway Company has increased its capital stock from \$600,000 to \$1,000,000. The increase is to be used for extensive improvements which the company has in contempla-

Dansville, N. Y.—The formal transfer of the property of the Dansville Gas & Electric Light Company has been made to the new corporation known as the Dansville Gas & Electric Company.

Elizabeth, Pa.—Bids are about to be let by the Elizabeth Electric Light, Heat & Power Company of this place for the erection of a new plant to take the place of the present one, which is unable to furnish power for its increasing business. The new plant will be over double the size of the present one, and will be equipped with new prochings. with new machinery.

Georgetown, D. C.—The Potomac Electric Light Company has secured a permit to connect the Hearst School with their electric conduits.

Gloucester City, N. J.—Negotiations are in progress for the amalgamation of the traffic interests of the Baltimore & Ohio Railroad and the Delaware River & Atlantic City Railroad, the proposed electric line between this place and Atlantic City.

Greensburg, Pa.—The Greensburg, Jeannette & Pittsburg Street Railway has been sold at trustee's sale to J. B. Head for the Harrisburg Traction Company

for \$25,000. The new company will at once make extensive improvements, and in a short time extend the trolley line to Pittsburg, a distance of 26 miles.

Livingston, N. Y.-The New York & Staten Island Electric Company has decided to spend \$200,000 in improving its plant here.

Norwalk, Conn.-The Connecticut Lighting Norwalk, Conn.—The Connecticut Lighting & Power Company, which controls the majority of the trolley roads and gas and electric light concerns in this State, has secured control of the water rights of the Saugatuck and Aspetuck rivers, the Southport stream, the Westport Water Company & Electric Light Company, and formed a new organization under the name of the Southport Water Company. More than \$500,000 is being apent in this place in the erection of a gas, electric light and power plant.

Oswego, N. Y.—It is stated that the new company which has purchased the gas and electric light plant in this place will spend about \$90,000 in improvements.

Ottumwa, Ia.—The Ottumwa Electric Steam Company will build several miles of new track this season. T. H. Merrill, president.

Port Clinton, O.—The Port Clinton Electric Light & Power Company will increase its capital stock from \$10,000 to \$20,000 to enlarge its plant. D. O. Hull,

Williamsport, Pa.—The increase in the business of Williamsport, Pa.—The increase in the business of the electric light company, and the demand that is being made for power will of a necessity in time compel the increase of the capacity of the power plants here. It is understood that the electrical interests here are contemplating the erection of a large central power house. When this will be built or where the location will be have not yet been taken into consideration.

#### MANUFACTURING.

Cincinnati, O.—The Bullock Electric Manufacturing Company recently received an order from a Montreal newspaper company for a complete electrical outfit, including dynamos and motors, amounting to several hundred horse power.

Grand Rapids, Mich.—The Grand Rapids Railway Company recently closed a contract with the A. P. Allis Company of Milwaukee for another 1,200 horse power engine, a duplicate of the one put into the Lyon street power house by the same company last year. The price is in the neighborhood of \$40,000.

Pittsfield, Mass.—The dynamos for the Trenton (N. J.) Gas & Electric Company will be connected directly with the engine shaft without belting. They are being built by the Stanley Manufacturing Company of this city.

## POWER AND TRANSMISSION PLANTS.

Boise City, Idaho.—The Trade Dollar Consolidated Mining Company will invest \$250,000 in a power plant at Swan Falls on Snake River for the purpose of generating power for its mines and mills at Silver City and to supply other consumers. W. White will be in charge of the enterprise.

Ellsworth, Me.—The Ellsworth Water Company, which now controls both water and electric lights in this city, has ordered an electric power plant with generator of 500 volts and 150 horse power. The plant will be in operation ready to furnish power within two months. Several applications for power have already been made to Superintendent Cushman.

Oil City, Pa.—The National Transit Company will build a power plant for its private electric lighting plant and pumps at the rear of the office building on Seneca and Center streets on Oil Creek.

Steelton, Pa.—The management of the Steelton Store Company contemplates the erection of an electric power plant.

Washington, D. C.—An appropriation of \$6,500 was recently made for the installation of electric power for the service of the Washington Monument, and for the addition to the boiler house, also an appropriation of \$20,000 for one dynamo and connections for the monu-

#### AUTOMOBILES.

Brooklyn, N. Y.—The trolley emergency wagons of the Brooklyn Rapid Transit Company, which are pulled by teams of horses, are likely to be replaced by automobiles. Officials of the company are testing a specimen of the Riker Motor Vehicle Company's mschines, and if the test proves satisfactory the company will adopt the automobile and do away with the horse wagons. The automobiles will cost about \$3,000 apiece and the company will need seven of them.

Circleville, O.—J. P. Smith, W. Scheyler, Benton G. Hedges and others, are interested in the Colonial Carriage Company recently organized here for the purpose of manufacturing carriages, buggies and automobiles.

New York City.—Last week an electric sutctruck weighing when unloaded 4½ tons was exhibited in the streets of this city. The truck is about the size of the large brewery wagons commonly drawn by three horses. The batteries supplying the motive power are stowed away under the driver's seat, directly in front of which is the steering wheal which leads away the of which is the steering wheel, which looks exactly like the wheel on the front of a cable car. The vari-ous controlling levers, brake, and other apparatus are within easy reach of the driver.

# THE TELEPHONE WORLD.

## The Bell Telephone Metamorphosis.

The Boston "Post," referring to the removal of the Bell Telephone Company from Massachusetts to New York, says:

"As the Bell Telephone Company leaves its Massachusetts chrysalis to take wing as a New York butterfly, some incidental features of the change attract public attention. The stock of the Bell Company, which a week or ten days ago was selling in small lots at 344, sold as low as 311. And more than 1,000 shares changed hands in the Stock Exchange recently—an exceptional record for this stock.

"What is the significance of this rush to sell at lower prices just at the time the Bell Company is leaving Massachusetts? The increase in earnings, gross and net, has not been proportionate to the enormous output of instruments during the past year; and this would seem to indicate that the company is getting less returns from the use of its instruments. Furthermore, the net output of telephones for the four months ending April 20, 1900, shows a falling off in comparison with the net output for the same period last year. These two facts, taken together, seem to indicate that at last the great telephone monopoly has begun to feel the effect of competition.

"Further than this, in the great stock-watering arrangement whereby the Bell Company becomes a New York corporation, the capital stock is doubled, and additional stock to the amount of one-fifth the increased capitalization is to be issued. To keep up the pace of 15 per cent. dividends on the original Bell Company stock it will be necessary to earn 7½ per cent. on the watered capital and enough more to pay an equal profit on the new issue about to be distributed. The growing readiness to sell, which the Boston stock market reports show, and the remarkable drop in quotations of price, seem to imply a doubt of the efficacy of the change to produce the usual fat surplus at the end of the year."

# Plans of the Knickerbocker Telephone Company.

The Knickerbocker Telephone & Telegraph Company desires to announce that it has commenced the construction of its plant, which will be extended to all the five boroughs of New York City. Its rates for unlimited service will be \$120 per year for business houses, and \$60 a year for private residences. Its charges for limited service will vary from \$60 a year for 700 messages to \$110 a year for 2,500 calls. Special rates will be made to extensive users of the telephone. The offices of the company are located at 416-422 Broome street, New York City.

Mr. V. M. Tyler of the Southern New England Telephone Company was in Norfolk, Conn., recently, looking over the plant which his company has purchased. The company is considering the best means of running the Norfolk plant, and it is reported is looking at the West Norfolk Axle Works with a view to moving the plant of the Norfolk Electric Light Company thither. Should this come to pass water power will in all probability be substituted for gas, which at present runs the plant.

Advices received from Lawrenceburg, Ky., state that the case of the East Tennessee Telephone Company vs. the Anderson County Telephone Company was decided in favor of the defendant. The new company seeks to establish its plant in Lawrenceburg in opposition to the East Tennessee Company, and scored a complete victory. The old company claimed an exclusive franchise.

The New York & New Jersey Telephone Company has completed laying a mile and a half of subway in Flushing, L. I. The wires are taid in wooden boxes creosoted and filled in with a tar cement, which are buried beneath the surface of the ground. This is the first of a series of similar subways to be laid by this company in all the thickly settled portions of that borough.

The American Electric Telephone Company was incorporated at Trenton, N. J., on the 10th inst., with an authorized capital of \$3,000,000. The company is empowered to manufacture telephones and other electric appliances. Of the capital \$1,000,000 is preferred stock with 6 per cent. non-cumulative dividends. The incorporators are: Barnett R. Ruggles, Henry M. Haveland of New York, and James C. Young, Jersey City

The Telephone, Telegraph & Cable Company of America, which recently purchased the plants of the independent telephone companies in Westchester County, has completed its line through the boroughs of Manhattan and the Bronx, and is now up to the city line of Mount Vernon. A large force of men is at work rushing the construction of this line so that the Mount Vernon and New Rochelle subscribers of the company may have a New York City connection.

#### The New Signal a Success.

The new signal system, which has been recently introduced into the exchanges of the John street, Riverside Drive, Madison Square and Harlem sections of New York City, has proved both economical and capable of much saving of time. Instead of the old scheme of having the girl at "Central" notified of a call by the noisy falling of a brass indicator, the desks of the new exchanges show a multitude of minute electric light bulbs. These work automatically with the movements of the telephone that call for a number, and also the one at the other end, different combinations of lights meaning different things to the girl at the board.

She can tell without constantly asking "Have you finished?" exactly when the talking parties wish to be disconnected, and the amount of work that she does with both hands and mouth is tenfold less than it was under the old system. Then, too, the 'phones connected with these new exchanges are not encumbered with the old bell cranks, but a simple removing of the receiver from its hook lights the tiny electric light on the central switchboard.

The mechanism is so arranged that when any one answers a ring at his 'phone he never has the ringing continued after he has taken up the receiver, for the removing of the latter from its hook destroys the current which rings the bell. Hence the old trouble of having the drum of one's ear shocked violently is obviated. The subscriber's 'phone, besides occupies much less space, as the clumsy battery which formerly accompanied each one has been abandoned, its place being taken by a common battery that is placed at the exchange, and does work for every individual wire having a terminal there.

# The Toll System of Telephone Charges in Germany.

From a German contemporary we learn that the larger proportion of telephone subscribers in Berlin have preferred the old tariff system of a fixed sum per year, and only about one-fifth (8,000 subscribers) have elected to be charged according to number of conversations. The latter class of subscribers, says the "Electrician," London, include chiefly the small offices and shops, and it is considered that the attraction to them of this system of charging is that they are entitled to loan their telephones at the rate of 5 pf. per conversation. Doctors, lawyers and private persons who have the telephone chiefly to enable others to call them up have naturally preferred this system also. The fixed rate system has been preferred by the owners of larger restaurants, hotels, cigar shops, etc. The Bavarian and Wurtemburg post offices have followed the example set by the Imperial post office, and have also made the toll system optional. In Munich 516 out of 5,500 subscribers have chosen it, in Nuremberg 390 out of 2,800, in Augsburg 101 out of 580, in Wurtzburg 120 out of 580, in Furth 38 out of 540, in Bamberg 43 out of 230, in Regensburg 31 out of 230, and in Landshut 2 out of 55.

The People's Telephone Company of West Superior, Wis., which is making the fight against the old Bell Company, has already received orders for more instruments than the present size of the switchboard will accommodate, and has ordered another section of board on this account. The old company still continues to do business, but has lost a good many subscribers since the new system has been working well.

The Bell Telephone Company in a statement at Buffalo, N.Y., relative to the settlement of the strike of their linemen, who returned to work last week, say that on January 1 the company increased the wages of its men to \$2.25 and on April 26 to \$2.50. At a meeting held recently the company declined to concede the demands of the men for eight hours' work, time and a half over time and double time Sundays and holidays, and the men decided to waive these points and return to work, the company agreeing to protect and retain them in their positions.

The Keystone Telephone Company of Philadelphia has been granted a very liberal franchise by the councils of that city. The Bell telephone people opposed the granting of the franchise, but the councils of Philadelphia believe in improved and cheaper telephonic service.

A dispatch from Monroe City, Mo., states that during a heavy thunder storm recently lightning struck the local telephone lines, destroying nearly 200 connections and wrecking the switchboard. It being Sunday most of the employes were absent and no one was injured.

At a special meeting of the New England Telephone & Telegraph Company held in New York City last week it was decided to increase the capital stock of the company from \$15,000,000 to \$22,000,000.

## No Municipal System for Chicago.

A dispatch from Chicago to the N. Y. "Times" states that Mayor Harrison recently received such a favorable proposition from the Chicago Telephone Company regarding the overhauling and maintenance of the police and fire telephones that he directed City Electrician Ellicott to abandon his plans of inaugurating a municipal system. The offer of the corporation means a reduction from \$5 to \$1.50 per instrument, or a total cut of \$5,250 for 1,500 telephones. Mayor Harrison said he could not see how the city could install the system and avoid losing money in view of the company's offer. The city telephone bill last year was \$7,500. All the city will have to pay now will be \$2,200.

#### The Michigan Telephone Company.

Under Erie management the Michigan Telephone Company has in sixteen months made a greater gain of subscribers than under the old management covering a period of twenty years. The increase, it is claimed, exceeds 100 per cent., or 19.000 subscribers, and the total number connected June 1 will be 38,000.

In the United States Circuit Court of Appeals, Richmond, Va. on May 7, Judges Simonton, Brawley and Purnell presiding, the case of the Southern Bell Telephone & Telegraph Company against the City of Richmond came up for argument on appeal from the decision of the Circuit Court of the United States for the Eastern District of Virginis. The question involved in this case is whether or not the city can, after granting the Telephone Company the right to occupy its streets, revoke said right and cause the Telephone Company to remove its poles and wires from its streets. The city attorney claims it can, and the attorneys for the Telephone Company contend that the Legislature, having reserved the right to repeal the charter, the Legislature is the only body that can repeal the same.

The city of Florence, Ala., is just now much interested in long distance telephone connections, and the outlook for connection with the outside world in a short time is said to be very promising. A special representative of the Bell Telephone Company is in Florence with a view of perfecting arrangements for the connection. A private telephone line now connects that city with Iron City, Tenn., and from that point there is another line to Columbia, Tenn., where long distance lines of the Bell Company touch. Arrangements will either be made to connect at Columbia by the purchase of the private lines between Florence and Columbia, or else the Bell Company will build direct to Florence.

The city council of Winfield, Kan., has granted a fifteenyear franchise to W. B. Hurst, of Springfield, Mo., to operate a telephone system in Winfield, the city to get a firealiarm system free and 4 per cent. of the gross receipts. There were three independent companies asking for franchises. Mr. Hurst has thirty days from May 8 to accept the conditions, ninety days to begin work, and nine months to complete the system. He is to deposit a certified check for \$5,000, and the maximum rates are to be \$2 a month for business houses, and \$1 for residences.

The Harrisburg, Pa., councils are being urged to pass the ordinance giving the Harrisburg Telephone & Telegraph Company the right to erect its poles and wires in that city. The new company is after privileges at Middletown, Royalton, and other Pennsylvania towns.

A telephone exchange is about to be installed at Morehead, Ky., and a line will be built to connect with the long distance system.

A new telephone company is said to be likely to become a competitor of the Bell Telephone Company at Lockport, N. Y.

The Automatic Telephone Company has asked for a franchise to erect poles and string wires through the streets of Brockton, Mass.

A telephone exchange has been opened at Flatonia, Tex., with fifty subscribers.

#### TELEPHONE INCORPORATIONS.

The Northern Electric Telephone Company, Willmar, Minn. Capital stock, \$30.000. Incorporators: D. N. Tallman, J. Williams, A. Larson, all of Willmar; J. L. Schoch, C. H. Dirks, both of New Ulm.

The Home Telephone Company of Champaign, Champaign, Ill. Capital stock, \$20,000. Incorporators: W. A. Heath, D. C. Morrisey, M. Savage, all of Champaign.

The Camden Telegraph & Telephone Company of Camden, N. Y. Capital stock, \$1,000. Incorporators: Miner P. Osborne, Maria Osborne, Benton Osborne and Walter Buddles,

# ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers a compiled from special reports received by Electractry from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to see, re accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic,  $16\frac{3}{2}$  @ $16\frac{1}{6}$  1.; Lake,  $16\frac{3}{6}$  @17c.; casting,  $16\frac{1}{6}$  @ $16\frac{3}{6}c$ .

The stockholders of the Donver Gas & Electric Company held their annual meeting in Danver on May 8 and re-elected the retiring directors. The financial statement for the year has not been received.

The latest quotations for some of the new industrial stocks, not given elsewhere are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 8½@9½; New England Transportation, 4@42; Gramophone, 45@59.

The Logansport, Bochester and Northern Traction Company of Logansport Ind., has filed a \$4,000,000 mortgage in favor of the Mercantile Trust Company of New York. The money is needed to equip a line from Logansport to Kendalville.

The annual stockholders' meeting of the Erie Telegraph and Telephone Company will be held June 12 in New York. Stockholders will be asked to consider and act upon the question of increasing the number of directors from 12 to 25.

The earnings of the Third Avenue Bailroad Company for March, as reported by the receiver are \$184,288; net \$67.211; surplus \$33.827; 42nd Street, Manhattanville and St. Nicholas Ave. March 19 to 31, earnings \$16,573; net \$1,097; deficit \$2,976.

Earnings of the Manhattan Elevated Railroad Company of New York for the quarter ended March 31 show: Gross, \$2,401,176: operating expenses, \$1.321,694; net, \$1.079,582; other income, \$202,363; total, \$1,281,945; charges, \$656,392; surplus, \$025,553.

To pay for extensions and improvements the Portsmouth Street Railway Company of Portsmouth, Va., has executed a mortgage on part of its extensive property to secure the Colonial Trust Company, of Philadelphia, for \$100,000 of twenty-year bonds.

Owing to default of the City of Austin, Texas, 5 per ceut. waterworks and electric light bonds, a committee has been formed for mutual protection and asks holders to communicate with the New York Security & Trust Co., or the Mississippi Valley Trust Co., of St. Louis.

The statement of the Utica Electric Light and Power Company for the year ended December 31, shows: Gross earnings, \$118,700; operating expenses, \$68,212; net earnings, \$59,488; add net earnings as se and repair department, \$8,000, total net earnings, \$58,488 ; interest on bonds, \$25,000; aurplus, \$33,488.

The Canton-Massillon (O.) Electric Railway Co. has increased its capital stock from % 0,000 to 1,000,000. The increase, which is to be met with an issue of bonds, was necessitated by the extensive improvements which the company has in contemplation for the coming summer, some of which are already under way.

The governing committee of the New York Stock Exchange has adopted resolutions, to take effect June 1, 1930, restricting the use of private telephones and telegraph wires connecting offices of members with offices of non-members, and placing such wires under control of the committee of arrangement.

The North Jersey Street Railway Company, which controls nearly all the trolley lines in Northern New Jersey, has been negotiating with the Hudson River Tunnel Company, with a view to running its trolley lines from Fifteenth street, Jersey City, under the North River to Morton street, New York, and there connect with the Metropolitan Street Railway Company lines.

The latest report from the New England Electric Vehicle Transportation Company shows that there are now in operation in Boston between 50 and 60 electric cabs and 15 electric delivery wagons. The company recently reduced its capital stock from \$25,000,000 to \$5,000,000 and the par value of shares was reduced from \$100 to \$10. This action makes all the shares now outstanding full paid and non-assessable. The directors of the company are George von L. Meyer, Oliver Ames, Francis R. Hart, Martin Maloney. Charles L. Edgar, Frederick A. Gilbert, Colonel A. A. Pope, James E. Hayes and Robert McA. Lloyd.

The Boston "News Bureau" says: "The purchase has been consummated of the South Shore and Boston Street Rillway Company by the Massachusetts electric Companies on terms advantageous to the latter. The South Shore and Boston Company is a consolidation of five South Shore roads: The Hingham, Hanover, Braintree and Weymouth, Bockland and Abington companies and one other. It is considered probable that the new properties are taken over through an exchange of stock. The Massachusetts Electric Companies is well off in cash. It is understood to have \$800,000 on hand. Earnings of 2 per cent on the common stock are looked for for the fiscal year ending with June."

The Mexican Telephone Company reports for the year ended February 28: Gross revenue (Mexican currency), \$163,649, increase, \$21,702; expenses, \$93,251: increase, \$10,754; net revenue, \$67,389; increase \$10,948. The report says that in the city of Mexico about 50 per cent. of the subscribers are now supplied with long-distance instruments, as compared with 20 per cent. at the beginning of the year. The year closed with 71 new subscribers to be connected. At the annual meeting of the stock holders the retiring directors were re elected, except that W. C. Carson of New York and Olis Kimball and Charles H. Bollins of Boston were elected to succeed Robert Colgate, James H. Dawes and Godfrey Moise, respectively.

The directors of the Third Avenue Railroad Company, New York City, met at the effices of the company, at 67.h street and Third avenue, on May 11, and approved of the form of the bond for \$50,000,000 for improvement of the road. Immediately after the meeting of the directors there was a meeting of the stockholders to approve of the bond issue. The law requires that two-thirds of the stockholders shall approve of the issue of bonds of a corporation. The mortgage securing the present issue covers the entire property and franchise of the company, and is made to the Morton Trust Company as trustee. The bonds are to become due in the year 2900 and are to bear interest at four per cent from May 1, 1900.

As stated in the last issue of ELECTRICITY the New England Telephone and Telegraph Company decided to increase its capital stock from \$15,000,000 to \$20,000,000. This increased capital will be used from time to time to meet the demands of the business in the way of new extensions. The company expends on an average \$1,500,000 per year in the extension of its business, and in the past new money has been derived by the sale of both bonds and stock. During 1899 the company issued \$1,783,000 of new stock of which \$983,000 was used for new construction and \$800,000 for account of the Southern Massachusetts Telephone Company. \$1,000,000 4 per cent. debenture bonds were also issued of which part were used to redeem \$500,000 6 per cent. bonds and the balance in new construction.

\$500,000 6 per cent. bonds and the balance in new construction.

The N. Y. "Times" says: "A new consolidation of copper properties is soon to come into the field. It will take over a number of Mexican and United States copper mines and be known probably as the Pan-American Copper Syndicate Company. The aggregate capitalization of the companies to be merged is over \$70,000,000 and the new corporation which takes them all in will be capitalized at only \$15,000,000,000 It is intended shortly to apply to have the stock listed here and on the London Exchange. The Mexican properties include among others, the San Luis mine, at Durango. Mex., the San Luis mine at Chihuahua, Mex., the San Anitie and the San Pedro of San Pablo. One of the American companies to be absorbed is the Arizona Eastern & Montana Co. which has mines at Tombstone, Cochise, and Mayer, Ariz., and runs a smelter at Bigbug Postoffice, Ariz., which it leases from the old Commercial Mining Co., controlled by Phelps, Dodge & Co. of this city.

# EDITORIAL NOTES.

The National Electric Light Convention.

As we go to press the Twenty-third Convention of the National Electric Light Association is about to be held

in Chicago. Everything has been made ready by the gentlemen having the arrangements in charge so that the delegates may be sure of spending as enjoyable and profitable a three days in the Windy City as was the case in 1898. A glance at the programme of the Convention, which will be found elsewhere in this issue, reveals the fact that the papers to be presented are on topics of unusual interest, which should ensure full and interesting discussions. Among other things the question of municipal ownership of electric lighting plants will be touched upon, and a report will be made regarding the progress of the investigation of municipal plants, and plans formulated for the continuance of the work.

The entertainment committee has put forth unusual efforts to make the stay of the visiting ladies enjoyable, and with that end in view arranged for a reception to be held on Monday evening at the Auditorium parlors, for an automobile ride for the ladies on Tuesday morning, with luncheon at the Washington Park Club; on Wednesday, a shopping tour in the morning and a matinée in the afternoon; on Thursday the Art Institute and Public Library will be visited in the morning, and a matinée in the afternoon.

Altogether the Twenty-third meeting of the Association promises to be one of the most instructive and enjoyable yet held.

\* \* #

The Gas Engine as a Competitor of Steam.

During the past few years, the gas engine has been coming more and more into use as a prime mover in elec-

tric light and power stations. This has been partly due to the fact that gas engine manufacturers have been turning out machines of constantly greater power, and that while a five or ten horse power engine was the limit a few years ago, to-day efficient gas engines of many times that power may be obtained. Another cause, aside from any question of economy, which has helped to create a demand for this type of prime mover, is that a machine of this description requires far less space than a

steam engine with its accompanying boiler, condenser, feed water heater, etc., which is a fact well worth considering where land is expensive and it is a question of economizing in construction.

Another advantage to be derived by the use of gas engines in connection with electric generating stations, especially those situated in thickly populated districts, is that coal and ashes do not have to be carted and carried away from the stations, and the only water necessary is that utilized in cooling the engine cylinders.

Referring to the efficiency of the gas engine as compared to the steam engine in the "Engineering Magazine" for April, Mr. A. D. Adams says:

"The best steam engines do not change more than 15 per cent. of the heat supplied them into mechanical energy, and boilers rarely give over 80 per cent. efficiency. Gas engines will return 20 and even 25 per cent. The combined efficiency of steam engine and boiler is at best 12 per cent., which may be assumed as about equivalent to 1.63 lbs. of anthracite of 13,000 B.T.U. capacity per pound. Coalgas, and water gas are not recommended for power purposes. Coal gas only contains 25 per cent. of the energy of the coal from which it is made, while water gas contains about 60 per cent. Hence the combined efficiency of coal gas plant and gas engines is only 6.25 per cent., and that of water gas about 15 per cent. Producer gas contains as much as 80 per cent. of the calorific capacity of the fuel it is made from, and the cost of apparatus exceeds by very little that of boiler plant for equal power. The combined efficiency of producers and engines may thus be 20 per cent. With the same anthracite as above, the horse-power-hour may be obtained with 0.98 lb. of fuel, as against 1.63 lbs. with steam engines. The fuel saving is nearly 40 per cent."

There are, however, other advantages besides those already mentioned. For instance, producer gas can be made from fuels of a quality too poor for steam raising purposes.

Mr. Adams considers that electric stations have peculiarities rendering them particularly suited for gas power. The load, for example, susually ranges from a fourth to a half of the maximum load, and the changes are rapid, and ordinarily, load may vary from average to maximum in one hour, while maximum load rarely endures for two hours in twenty-four—this of course refers to lighting stations. The result

of all this is not merely that there must be sufficient engine power to carry the maximum load, but that the boilers also must be of the same full power. With producer gas, however, a cheap form of gas-holder will enable the gas-producer to be run steadily, and the peak of the load curve will be dealt with by the stored gas. Storage batteries, of course, have been applied to steam-driven stations, to get over the peaks of the loads, but the storage battery is equally applicable to gas-driven stations, and still leaves the above further advantage.

In Europe gas engines are employed even more extensively than in this country for the direct driving of electric generators, which may be in part attributed to the conservative and non-committal stand that our gas engine manufacturers took some four years ago, when this type of prime mover was first beginning to compete with steam. Since then, however, conditions and opinions have undergone a material change, with the result that the gas engine of to-day is unquestionably a serious competitor of the invention of the illustrious Watt.

The Equipping of Trolley Cars With Up-to-Date Brakes. In a city such as Greater New York, where on almost every principal thoroughfare electric street

car lines are to be found, accidents to pedestrians are inevitable. But it does not necessarily follow that because accidents are bound to occur that no means should be taken to reduce the number to a minimum by the use of proper electrical and mechanical appliances. Almost every issue of the daily papers contain accounts of injuries of a more or less serious nature sustained by inhabitants of this city, owing principally to the inability of motormen to control the ponderous cars that are coming more and more into use. Where an electrically-propelled car weighs ten or twelve tons, and is running at a speed of seven or eight miles an hour, it is about as reasonable to expect to bring it to a standstill within a few yards in case of an emergency by the hand brakes now generally in use, as it would be to stop the Empire State Express with the braking appliances in vogue twenty years ago. And yet the majority of street railway companies cling through parsimony or conservatism to a type of brake that indirectly causes them an outlay of thousands of dollars annually in damages and lawyers' fees.

Last September, as will be recalled, this question was taken up by the New York State Railroad Commission. A number of different types of brakes were tested on cars which were run on a stretch of track belonging to the Metropolitan Street Railway Company in this city, and it was hoped that the information and results obtained by these trials would warrant the commissioners in recommending some braking appliance that would appeal to the various railway companies. Like many other good things, however, the tests started out with a great blare of trumpets only to end in a pitiful wail, for as nearly as can be ascertained outside of obtaining a certain amount of information and data, which is probably lying in a dusty pigeon-hole at Albany, nothing tangible has resulted, and the cars of the Metropolitan system are still equipped with slow-acting brakes.

In this connection it is interesting to note that two of the Brooklyn roads are waking up, the management evidently proposing if possible to stop the trolley car slaughter that has been going on for some time past in that borough. According to the Brooklyn "Eagle," it is probable that before any great period of time elapses the surface cars of the Brooklyn Rapid Transit Company and those of the Coney Island and Brooklyn Railroad Company will be equipped with a new and improved type of brake. This is to be inferred from the fact that these two companies have been experimenting with various types of braking apparatus. One type especially is said to have proved exceedingly satisfactory, so much so that an order for the equipment of one hundred trolley cars has recently been placed. The brake adopted consists of a simple friction device placed on the car axle, to which is attached a chain, which is connected to the sway bar of the ordinary brake rigging. The friction disk on the axle, which winds up the brake chain, is quite heavy, and when a car is moving rapidly, and an emergency stop is required, the friction surfaces are pressed together. This causes the disk to rotate on the axle, and when it is moved far enough to pull the shoes against the wheels it has attained a high velocity of rotation. As in the Sperry brake the pressure is greatest at first, which is automatically and gradually reduced as the car slackens its speed.

As previously stated in these columns there is no great difficulty in finding a quick-acting brake suitable for overhead and underground trolley cars, as there are a number of such brakes already on the market. Where the trouble does lie, however, is in making the management of the various street railway companies, see the necessity of changing their braking appliances, and if they stand in their own light, and insist on adhering to more or less antiquated methods, drastic measures should be adopted by the proper authorities in the interest of the public.

\* \*

The Philadelphia Meeting of the American Institute of Electrical Engineers. The Seventeenth General Meeting of the American Institute of Electrical Engineers was held at the

Drexel Institute in Philadelphia on May 16, 17, and 18. This was the third meeting of the Institute that has been held in that city, the first taking place during the period of the International Electrical Exhibition, in 1884, and the second in 1894, under the auspices of the Engineers' Club.

The meeting which drew to a close last week was made conspicuous by the number of interesting papers presented. Special mention should be made of those descriptive of apparatus for testing electric motors, and of the "Percentage Bridge," an instrument for measuring resistance. The subject of "Eddy Current Losses in Transformers" was taken up and discussed at some length by Mr. Steinmetz who disagreed in some respects with the conclusions drawn by the author, Mr. Townsend. Generally speaking, however, the papers treated of practical subjects, which, in our opinion, is always much to be desired.

Among other things a report of the Committee on Units and Standards was made and discussed. It was remarked by one of the speakers that the practical engineer had a hard time of it between the pure scientists, with their new definitions and units of measurement, and the practical men, who held on to the old terms and forms of expression. It compelled him to translate the language of each to

the understanding of the other. This sentiment was heartily applauded. The report was adopted, and instructions were given to have it transmitted to the delegates to the International Congress for presentation at its meeting in Paris

The social features of the meeting were everything that could be desired, the delegates having an opportunity of visiting Cramps' ship-yard, which was followed by a planked shad dinner at Washington Park. The ladies of the party had several enjoyable sails on the Delaware, and on Wednesday afternoon took in a matinée.

# UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

In the State of Pennsylvania an electric railway mail route is to be established between Bristol and Doylestown.

Work on the transcontinental telephone line is being rushed through Colorado, and communication between Denver and Ogden will, it is claimed, be opened in September.

The distance record for electric carriages without recharging was beaten last week on the Paris-Dijon road, M. Garcin covering 262 kilometers (nearly 163 miles).

THE Executive Committee of the International Association of Municipal Electricians met in Brooklyn on May 17 and completed arrangements for the holding of the Fifth Annual Convention. This convention will be held in Pittsburg, Pa., on September 25, 26, and 27.

THE latest electric enterprise to make its appearance in Chicago, Ill., is the American Electric Carnival and Gondola Company, which is seeking a right of way for a line of electric boats on the Chicago River and drainage canal.

THE National Gold Reduction Company of Florence, Col., recently started the machinery installed in its plant. A new Corliss condensing engine, 300 horse power, drives a Bullock electric generator, which in turn runs six electric motors at different points in the mill, making the power in the plant practically electric throughout. The capacity of the mill has been increased by 120 tons per day, or 180 tons, as against sixty tons formerly. A Holthoff Wifley roasting furnace with cooler has been added, two sets of sixty-ton rolls, a 125-ton dryer and three fifteen ton chlorination barrels. Everything runs without a hitch anywhere. The National mill is now second in point of size at Florence. One hundred men are now employed against forty heretofore.

R. T. GREENER, United States commercial agent at Vladivostock, writes the State Department at Washington as follows: "Mr. Khikoff, Minister of Ways and Communications, had a special train sent to him on the Great Siberian Railroad some months ago. There were five coaches—one first-class, two second class, one dining, and one baggage car. All the appointments were excellent. There were, besides the usual library, pianos, writing conveniences (found in American cars), a barber shop, a gymnasium, a good supply of ice, patent boilers, dials which indicate the next station and the length of stop, double windows

to protect from dust and the extreme Siberian cold; and an observation car at the rear. On this train were attendants speaking English, French, and German. The cars were lighted throughout by electricity. There was no charge for the barber or for medical attendance. The bath costs \$1. From St. Petersburg to Irkutsk the transit occupies about seven days; from Moscow about six, and from Paris not more than twenty-eight days. The total length of the line to Vladivostock will be 4,714 miles. The cost will be \$400,000,000."

News from Portland, Ore., states that the Columbia Southern Railway Company has made arrangements for the construction of a telegraph line from Biggs to Shaniko. The line will require 5,000 poles and 178 miles of wire, and will be completed about the first of July.

Considerable difference of opinion prevails in regard to the liability of the United States Government for the damages sustained by the Cuba Submarine Telegraph Company during the Spanish-American war. The company has presentented a claim for damages, and the President has sent a message to Congress setting the matter before that body. In the opinion of one of the high officials of the Government, Cuba, and not the United States, is directly responsible for any losses sustained, as the company is a Cuban institution, and if any recompense is made he holds that Cuba should defray the same. The damages arose from the cutting of the cables by the American forces as a war-time precaution.

SEVERAL freight elevators for large warehouses have recently been received at Bahia, Brazil, from the United States, but the demand in this line is limited, because about all of the warehouses have been equipped and no new ones are being built. There is no market for passenger elevators, as there are few buildings of more than three stories, and an utter lack of office buildings as we know them.

THE Chicago authorities are forcing the traction companies to lay grooved rails on the streets of that city, as the only means of preserving pavements, and rendering traffic safe over the tracks. The old-style rails not only make it impossible to pave up to them, but they make it perilous to cross them on either vehicle or bicycle.

ELECTRICITY is to play an important part in recording the census of the United States in the use of the electric tabulating machine, which consists of three main parts, namely, the press or circuit-closing device, the dials or counters, and the sorting boxes. The press consists of a hard rubber plate, provided with 316 holes or pockets, the relative positions of which correspond with those of the holes in the keyboard and gang punches. Each of these pockets is partially filled with mercury, and they are thus in electrical connection when the circuit is closed, with the binding posts and switchboard at the back of the machine. Above the hard rubber plate swings a reciprocating pin box, which is provided with a number of projecting spring-actuated points, so hung as to drop exactly into the center of the little mercury cups below. These pins are so connected that when a punched card is laid on the rubber plate against the guides or stops, and the box is brought down all the pins that are stopped by the unpunched surface will be pressed back, while those that correspond with punched spaces pass through,

close the circuit and count on the dials. The circuit is broken first through platinum contacts at the back of the press. In this way no difficulty is experienced from the oxidation of mercury from the spark, as would be the case without this precaution.

WORK on the Rapid Transit tunnel has begun in earnest at 156th street and Broadway, New York.

It is stated that the automobile industry, though still in its infancy, is being rapidly developed, and is destined to become an important factor in the manufacturing circles of Germany. The large amount of capital and energy that is being expended by German business men upon this industry indicates great confidence in the future of automobilism. In France, where automobiles were first considered seriously, the chief aim has been toward obtaining excellence in sporting and luxurious automobiles, but in Germany a directly opposite state of affairs exists, and the efforts there have been to further the manufacture of freight automobiles for transportation and freight carrying. Electricity and benzine are used almost exclusively as motive powers, and preference is shown for the former. The benzine automobile is more desirable for transporting heavy loads, but the present high price of benzine and the prevalent, though unfounded, fear of explosion of the benzine motor have made the electromobile the favorite.

THE Rev. Minot J. Savage, pastor of the Church of the Messiah in this city, sailed Saturday to make an automobile trip through Southern Europe. The automobile, which has been made for six, has room for luggage. The trip is laid across the Pyrenees into Spain and back to Paris.

F. H. KIRCHNER & Co. began last week to build the conduits for placing the electric wires of the Cincinnati Edison Electric Company under ground. The company will lay 250,000 duct feet or 50 miles of ducts, and will accomplish this big job in less than three months. The ducts are of tile and will be five feet beneath the surface.

SECRETARY GAGE recently transmitted to Congress a communication from Secretary Hitchcock, submitted with his favorable recommendation, an estimate of appropriation of \$53,423 for an electric plant for lighting the buildings occupied by offices of his department, known as the Patent Office, the General Postoffice, and the Pension buildings. specifications and estimate of cost, contemplating the installation of machinery in the General Postoffice building for generating a current for the whole service mentioned, were prepared by Commander George W. Baird, United States Navy, Superintendent of the State, War and Navy Department building. Secretary Hitchcock says: "The attics, basements and cellars of these buildings, where artificial light is constantly required, are filled and crowded to their utmost capacity with files and records, and I direct attention to the danger of the destruction of these valuable archives of the Government from the use of gas among this necessarily closely crowded and inflammable material. This menace would be materially lessened by the substitution of electric lights, and I urgently invite the favorable consideration of the estimate by Congress."

The type of street-car sprinklers which has been in use in Cincinnati for some time will shortly be given a trial in Indianapolis by the Indianapolis Street Railway Company. cars hold several hundred gallons of water or sufficient for one hour's trip at trolley speed.

H. H. VREELAND, president of the Metropolitan Street Railway Company of this city, has contributed to the current number of the "Independent" an article on "The Failure of Municipal Ownership." After asserting that private ownership of street railways is better for the people who ride, and the employes than municipal ownership, Mr. Vreeland cites a recent paper from Benjamin Taylor, F.R.G.S., who says that the experiment in Glasgow is only a limited success, while municipal ownership in other cities is so insignificant as to be unworthy of notice. Continuing, Mr. Vreeland says: "A man may ride eight miles in Glasgow for two pence; here he may ride for the same price fifty miles by means of our system of transfers. In Glasgow there are no transfers; here last year we gave away 148,000,000 of them. Therefore, when a man changes cars in Glasgow he pays a new fare, and travel there is quite likely to be dearer than here. It is true that one may ride half a mile for a half penny, but I don't see that that is any advantage, for if one only wants to go half a mile it is healthier to walk-and in Glasgow quicker."

THE Spalding St. Lawrence Boat Company of Ogdensburg, N. Y., has completed and delivered to Mr. George Bullock of Oyster Bay, N. Y., a 35-foot cabin electric launch, equipped with a 20 horse power motor designed and made by the Bullock Electric Company, of Cincinnati. The steering is done by a separate small motor attached to the rudder post under the stern deck, and managed entirely by two push buttons. The boat is also lighted by electricity. The same boat company is about to deliver to Collector George R. Bidwell, of New York, a 42-foot cabin electric launch, furnished with a motor made by the Electric Launch Company. This launch is of mahogany, and is provided with many new things. She is to be used on the Hudson River.

A saw is being introduced for surgical purposes which is driven by an electric motor. The motor runs at 2,200 revolutions a minute, developing in the neighborhood of one-tenth horse power. It is held in the hand of an assistant by means of a leather strap, so that it can be made to follow the hand of the surgeon who is using the saw. Attached to the motor shaft is a flexible spiral coil incased in a braided sheath. This enables the utmost freedom of movement on the part of the operator, who holds the saw in his right hand. This machine is being used extensively in several large hospitals. Its great value has been manifested in severe operations, where the shock attending the use of the slower-acting hand saw is so likely to prove fatal to the patient.

## Proposals Invited.

The Commissioner of Indian Affairs is inviting sealed proposals until June 4, for furnishing the necessary materials and labor required to construct and complete the electric lighting system at the Indian school at Salem, Ore. Specifications and full details may be obtained upon application to the U.S. Indian warehouse, 235 Johnson street, Chicago, Ill., or to Thos. W. Potter, superintendent of the school.

### THE TWENTY-THIRD CONVENTION OF THE NATIONAL ELECTRIC LIGHT ASSOCIATION.

The Twenty-third Convention of the National Electric Light Association promises to be one of the most instructive and enjoyable yet held. Every possible arrangement has been made looking to the comfort of the delegates who will gather in Chicago from May 22 to 24 to read papers and discuss topics of interest to electrical engineers in general and central station managers in particular.

As at former conventions special pains have been taken to give the visiting ladies a pleasant time, and with that end in view an automobile ride was planned for Tuesday morning,

comfort of the delegates is composed of the following gentlemen:

Louis A. Ferguson, chairman; B. J. Arnold, C. E. Brown, F. E. Donahue, H. R. Hixson, A. O. Kuehmsted, C. A. Munson, J. B. Wallace, F. B. Badt, F. H. Clark, Edward B. Ellicott, Samuel Insull, W. W. Low, Julian Roe, G. S. Whyte, George C. Bailey, Norman Collins, C. E. Gregory, E. B. Kettle, A. D. Lundy, Thomas I. Stacey, J. R. Wiley, Charles T. Boynton C. D. Crandall, Arthur Hartwell, F. W. Kohler, G. H. McKinlock, B. E. Sunny and James Wolf.

The official programme is as follows:

#### TUESDAY, MAY 22.

Meeting of the Executive Committee at 9 A. M., Secretary's office, Auditorium Hotel.

of Electrical Apparatus, Prof. Francis B. Crocker, chairman.

#### WEDNESDAY, MAY 23.

Morning session, 10 o'clock.

Paper-"Uniform Accounting," Lieutenant James Blake Cahoon, Syracuse, N. Y.

Paper-" Equitable, Uniform and Competitive Rates," Henry L. Doherty, St. Paul, Minn. Afternoon session, 2:30 o'clock.

Paper-"Series Enclosed Alternating Arc Lamps," Prof. William Lispenard Robb, Hartford, Conn.

Report of the Committee on Standard Candle Power of Incandescent Lamps, Dr. Louis Bell, chairman,

Paper-"Combination Electric Lighting,

AUDITORIUM HOTEL, CHICAGO, WHERE THE NATIONAL ELECTRIC LIGHT CONVENTION IS BEING HELD.

with luncheon at the Washington Park Club; on Wednesday morning a shopping tour will be indulged in, followed by a matinée in the afternoon, while on Thursday the Art Institute and Public Library will be visited in the morning and a theater after lunch.

As was the case two years ago, arrangements were made for holding a general reception in the Auditorium parlors on Monday evening, May 21. This custom has much to recommend it, as it furnishes the delegates and ladies accompanying them an opportunity of meeting old friends and making new acquaintances.

The Local Reception and Entertainment Committee which has so ably arranged for the

Morning session, 10 o'clock, Convention Hall, Auditorium Hotel.

Address of President Carnes.

Report of the Committee on Photometric Value of Arc Lamps, Henry L. Doherty, chair-

Report of the Committee on Grounded Circuits, Captain William Brophy, chairman.

Afternoon session, 2 o'clock.

Paper-"Exhaust Steam Heating," Harry J. Frith, Watseka, Ill., and Col. F. A. Copeland, La Crosse, Wis.

Paper—"Central Station Economies," W. L. Abbott, Chicago.

Report of the Committee on Standardization

Power and Railway Work," R. S. Feicht, Pittsburg, Pa.

Executive session.

Evening session, 8 o'clock, Auditorium Hall. Paper-"Alternating Current Generators," illustrated with stereopticon, H. G. Reist, Schenectady, N. Y.

THURSDAY, MAY 24.

Morning session, 10 o'clock. Paper—"Automobiles as a Source of Revenue to Central Stations," Elmer A. Sperry, Cleveland.

Report of the Committee on Amendments to Freight Classification, James I. Ayer, chair-

Topic—"Free Wiring." Discussion by Chas. R. Huntley, of Buffalo, N.Y.; E L. Bemiss, of New Orleans, La., and Dudley Farrand, of Newak, N. J.

Afternoon session, 2:30 o'clock.

Report of the Committee on Legislative Policy," Samuel Insull, chairman.

#### A HIGH VOLTAGE LONG DISTANCE; TRANSMISSION PLANT.

Considerable interest is being manifested throughout the United States over the practical results of the transmission of the electric current of the Standard Electric Company, in operation early next year if all goes well. The main trunk for transmission will be about 150 miles in length with numerous branches. The Standard Electric Company has expended nearly \$2,000,000 in this enterprise.

(Translated for Electricity, from "La Vie Scientifique," Paris, France.)

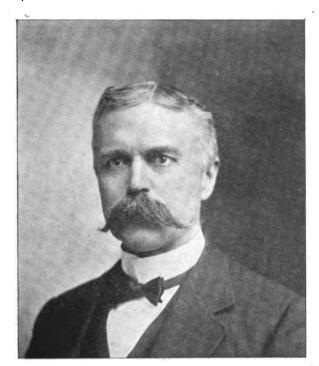

An invention of M. J. Vila y Forns of Gerona, Spain, to act as an automatic fire alarm in combination with a temperature indicator for distant locations will not fail to attract attention from the simplicity and ingenuity of its construction.

The essential parts of the apparatus consist of a thermometer having platinum electric conducting wires inserted in the stem, at distances of five degrees apart, and arranged in such a manner that the mercury touches the respective extremities of the platinum wires at the indicated degrees of temperature.

All the wires are brought to an indicating switchboard, which contains contact buttons corresponding in number to the platinum points inserted in the thermometer tube, and arranged in a semi-circle.

Each button is labeled with the number of degrees of temperature with which it is connected at the thermometer tube.

In the center of this semi-circle is pivoted an

The Haugh-Noelke Iron Works of Indianapo is Ind., was recently awarded the contract for the construction of the Agnes avenue viaduct by the Metropolitan Street Railway Company of Kansas City, Mo. The structure will require steel weighing 13,000,000 pounds and will be built without interfering with traffic on the viaduct that is now in use. The contractors agree to complete the work by September 1.

of which Prince Poniatowski is president, from the generating plant at the foot of the Sierra Nevada Mountains to San Francisco and the neighboring cities and towns. The reason is that the voltage will be the highest in the country, and the commercial transmission the longest of any in the world. There are many very interesting details associated with this work, the most striking, however, being in connection with the insulators, which are of a new and complicated system. The electric current will be transmitted from the power house of the Standard Company, two miles east of the county road between Jackson in Amador County and Mokelumne Hill in Calaveras County, by means of aluminum cables threequarters of an inch in thickness, composed of thirty-seven wires laid one over the other in a series of twists in opposite directions, and then bound together. The service of carrying 60,000 volts to be imposed upon them is something unexampled, and therefore the tests to which they have been subjected are extraordinary. The tests proved entirely satisfactory. sustaining sixteen times the pressure to which they will be put in actual transmissions. The transmission system will consist of two cross sections. The first installation will be from the power house along the mother lode for the use of the mines and mining towns, thence to the power house in Stockton, from that place to the Mission San Jose, to Oakland, from the Mission San Jose to Alviso, and to South San Francisco. The line from Alviso along the west side of the bay to South San Francisco will be exploited by another company to which the current will be supplied by the Standard Electric Company. It is expected that this section of the work will be in operation by next July. The second installation will be to San Francisco, and will be placed

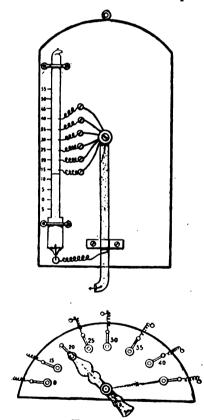

DIAGRAM OF TEMPERATURE INDICATOR APPARATUS.

indicating switch-arm, as shown in the illustration, and so arranged that its extremity can come in contact with each of the buttons when turned on its pivot. A wire connects this switch arm with the mercury in the bulb of the thermometer, and in circuit is placed an alarm bell and a battery.

The apparatus operates as follows: If, for example, the switch arm is turned to be in contact with the button marked 20°, an electric

current is established through the mercury of the thermometer when the temperature at the thermometer reaches 20°, and consequently the bell immediately gives an alarm.

This device is known as the "Phénix," and when it is installed in an establishment it positively and instantly informs the manager or the watchman of an increase of temperature in a part of the building, from any cause, such as the breaking out of a fire, overheating or an explosion, by the ringing of the bell in his office.

In factories, offices or other buildings this device is arranged to light a small incandescent lamp, which indicates which hall or room is at a dangerous temperature. Such is its use as a fire alarm, but as previously mentioned this apparatus also serves as a means of indicating temperature at a distance.

The larger number of industries have need of means to regularly indicate the temperature in various parts of their factories, storehouses, cellars, etc, They have heretofore been obliged to take the trouble to visit these sections or depend on the watchfulness of an employe to personally inspect the thermometers variously located.

M. Vila, by means of his invention enables them to know at any time the temperature of the various sections of their establishments without leaving their office. Naturally such an application calls for a special arrangement to secure precision. Should there be a change of temperature above the maximum permitted by the manager the bell informs him, and he can give orders accordingly.

In a similar way the apparatus has been constructed with a range of  $-30^{\circ}$  up to  $+200^{\circ}$ , and to give notice of a rise in temperature above a certain maximum, as well as in the case when the temperature falls below the minimum desired.

We can see that the invention is applicable to all places where temperature plays an important part of any kind, but the place above all others where it is of greatest absolute utility, is on steamships, those engaged in commerce as well as warships, for every one knows that when a fire occurs in the hold of a boat, the coal magazine or in some other part, it is generally discovered when it is too late to extinguish it.

The "Phénix" indicator makes such cases impossible, and at the same time enables the captain on the bridge to determine if the different compartments of the ship are suitably heated.

The minister of the Spanish Marine has well understood the serviceability of the invention, for by royal decree, of February 26th last, the "Phénix" device was ordered to be installed immediately on all the vessels, and in all the powder houses and store rooms of explosives which pertain to the Spanish Marine Service.

This decree was issued after a trial on the boat Carlos V, which showed in a decisive manner its evident importance, and above all the absolute security that the invention insured. Considerations were shown the inventor by the Government, in issuing to him by a decree of February 13th, the naval marine cross.

The Spanish press has showered on M. Vila, the greatest praise for his humanitarian invention, which is destined to render a very great service to a large number of industries.

The device is patented in all countries, and it is to be found in the electrical section, part V, class 27, at the Paris Exposition, in a pavilion annexed to the Spanish section.

#### PORTABLE LIGHTING PLANTS.

#### BY FRANK C. PERKINS,

The tendency of modern dynamo driving is at the present time entirely toward direct connection with the engine, even in plants of very small size. Frequently this method is adopted when belt-driven machines would do Wild West show. These are not direct-connected outfits, but the generators receive their power from a couple of 25 hp. Case automatic high speed engines delivering their power through the pulleys shown. A couple of fire engine boilers supply the necessary steam at 80 to 100 lbs. pressure. The engines operate at 550 revolutions per minute, and weigh with-

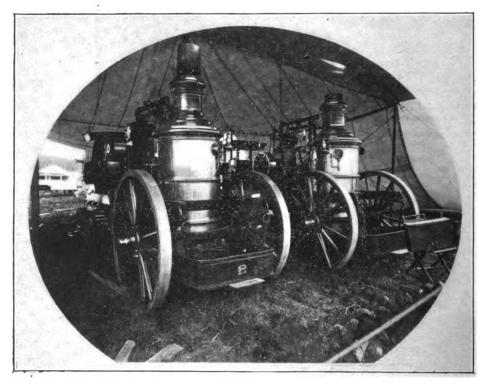

FIG. 1.—PORTABLE LIGHTING PLANTS OF BUFFALO BILL'S WILD WEST SHOW.

the work equally well, and at much less cost to the owner.

The portable lighting plant is, however, one case in which a direct driven machine has

out boiler and generator considerably less than a ton.

In Fig. 2 may be seen the latest portable outfit, which is owned by Barnum & Bailey.

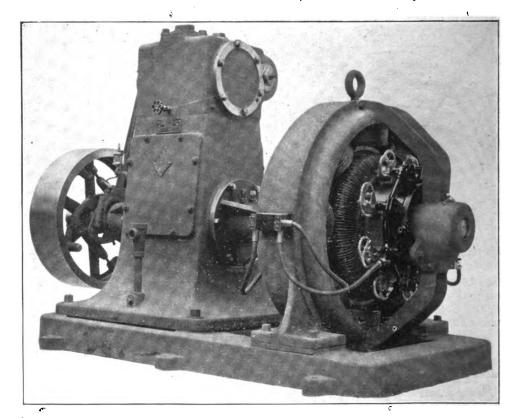

Fig. 2.—Latest Portable Outfit of Barnum & Bailey's Show.

many advantages, the principal one of which, is that of economy of space.

The illustration, Fig. 1, shows a couple of portable outfits used for lighting Buffalo Bill's

They are to use this lighting plant in their tour throughout Germany during the coming season. The electric generator is a C. & C. direct current dynamo, while the engine was built by the New Britain Machine Company of New Britain, Conn.

These engines are frequently used for portable plants with many different types of generators, both bipolar and multipolar, the engine bed plate being very often arranged with a special outboard bearing.

#### ELECTRIC HEADLIGHT LANDSCAPES.\*

The accompanying engravings will be of interest to those who have not become familiar by experience with the capacity of an electric headlight to illuminate the portion of a railway track with which the engineer is directly concerned and with which the public has an indirect concern from the point of view of safety. The illustrations are reproduced from photographs taken during the night of April 27 on the Peoria & Eastern division of the Cleveland, Cincinnati, Chicago & St. Louis Railway. The place selected was a short distance out of Indianapolis, and the time was chosen partially on account of the fact that at that time no disturbance of the light was to be expected from the untimely interposition of the moon, which was due to rise near morning. We are indebted to the courtesy of Mr. C. A. Paquette, superintendent of the Peoria & Eastern division, for

FIG. 1.—ELECTRIC HEADLIGHT LANDSCAPES.

the opportunity to pose the engine and for arrangements which insured no interruption from freight trains during the photographic process. Mr. E. M. Costin, train-master, was present as representative of the railroad company.

The engravings themselves require little explanation. Fig. 1 was taken with the engine at a point about half a mile from the bridge, which appears in the distance, while in Fig. 2 the engine was stationed about 1,000 feet from the bridge. The embankment, which appears clearly in the photograph from which Fig. 1 is reproduced, though its distinctness is somewhat diminished in the half-tone reproduction, is at a distance of about three-fourths of a mile from the source of light. The same embankment appears more clearly in Fig. 2. It should be stated also that the trees, etc., upon each side of the track, appear to a greater or less extent upon each of the negatives, but owing to the unequal distribution of light as between the

center of the track and at a distance to one side, details of this character are mostly lost in printing.

The engine used is No. 555, which is employed in passenger service on the division,

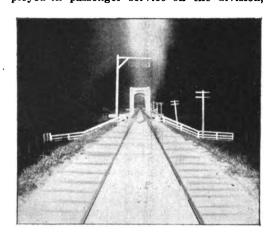

FIG. 2.—ELECTRIC HEADLIGHT LANDSCAPES, and left the scene of the photographs directly to take its place at the head of the Peoria train. The Pyle-National electric headlight constitutes a part of the regular equipment of the engine.

### SYSTEMS AND EFFICIENCY OF ELEC-TRIC TRANSMISSION IN FACTORIES AND MILLS.\*

BY WILLIAM S. ALDRICH.

The recent progress in the use of electricity for the transmission of power over short distances has developed a new industry. It bids fair to rival in magnitude and usefulness the field of long-distance transmission, much earlier developed, and now almost exclusively held by electricity. As applied to factories and mills electricity is simply a means to an end, which is primarily the transmission of power over quite short distances, from 50 to 500 feet, and within one building or a group of buildings. Upon entering this new field it has had to contest every inch of its progress in competition with long-established usage, in order to displace the unwieldly and unsightly power transmissions by shafting, belting, and rope drives. In almost all cases of new manufacturing plants, however, the features of electric transmission have received thorough consideration, resulting in many factory installations in which this system is exclusively used.

Some manufacturers have hoped that electricity would solve all of the problems, and at once, upon its introduction into their establishments; others have known it would be of no use from the beginning. There are many factories and mills in which the introduction of electricity for power transmission will not pay, under existing conditions; there are more establishments in which it would pay, in which an investment in electric transmission would prove to be a dividend-paying investment. No general rules can be laid down. Each case must be carefully examined, and a most thorough preliminary survey made of all the conditions and requirements.

SYSTEMS OF ELECTRIC DISTRIBUTION FOR FACTORIES.

In choosing a system of electric transmission for manufacturing work, it is not necessarily best to have that one system which will the

most readily lend itself to all of the work to be performed, for light, heat and power service. A composite system may prove best suited, even in such short-distance transmission. That is, lighting service will, in general, be more satisfactory, and need not be more expensive, if supplied independently of the power service. Direct and alternating currents are equally adapted for factory transmission, and by simple or multi-circuit systems of distribution; that is, by two, three, or four-wire systems, as the case may require! Preferably, all distribution should be direct; that is, without the use of storage batteries, rotary converters, or transformers, except for certain lines of work in which it may be necessary to use one or the other of these indirect systems of distribution.

811

In the matter of voltages a wide range is possible: 110-volt two-wire and 220-volt threewire systems for use of either direct or alternating currents for light and power; 440-volt two-phase alternating current three or fourwire systems for both light and power: 550-volt direct-current two-wire system, or 550-volt alternating-current three-phase three-wire system, chiefly for power service, or the monocyclic system for both light and power. In general, it will not be necessary nor advisable to use over 550 volts, direct or alternating current. Shocks arising from accidental contact with wires carrying currents of this voltage are not necessarily dangerous. Experience has shown that workmen respect the distributing wires the higher the voltage. But it is not necessary to command such respect by raising it above 550 volts.

#### ELECTRIC TRANSMISSION BY DIRECT CURRENTS.

At the time that electricity was introduced into manufacturing establishments the direct-current system was the only one available. For the peculiar and exacting service required in driving all kinds of machine tools and various workshop appliances, there were difficulties to be overcome with any system. It was necessary to secure satisfactory methods of producing a large starting turning moment, or torque, for varying the speeds as might be required under uniform or variable loads, and for reducing to a minimum the trouble arising from the use of a commutator.

With direct current motors, it was a simple matter to introduce starting boxes (resistances) in the armature circuit to control the torque, as well as rheostats (resistances) in the fields to control the speed in particular. But every such resistance meant an expenditure of energy in otherwise useless heating of the wire or other material of which these resistances might be made. The so-called Ward Leonard system came to the rescue with its two additional machines in order to operate the one given machine as a motor, at practically a constant efficiency under all conditions of load and speed. This system has been very successfully and extensively used in elevators, cranes, etc. By the use of the auxiliary machines the supply voltage may be varied according to the speed desired, and the current supplied according to the torque required, without wasting any energy in heating wasteful resistances. For conditions of factory service permitting of such an application, two motors may be advantageously used on one machine or set of machines, by means of which it is possible to vary the torque and speed quite as satisfactorily as in streetcar working, by the series-parallel method of control.

The difficulties with commutators have been

<sup>•</sup> From the "Railway Age," Chicago, Ill.

<sup>\*</sup> Abstract of paper read at the Cincinnati meeting (May, 1900) of the American Society of Mechanical Engineers.

almost entirely overcome and many refinements in design effected, so that the direct-current motor of to-day leaves little to be desired. Such objectionable features as still remain are inherent in the direct-current system used, and are found to lie chiefly in the kind of armature, commutator and brush devices required. These parts are most liable to derangement, require systematic attention for cleanliness and efficiency and renewals of brushes.

ELECTRIC TRANSMISSION BY ALTERNATING CURRENTS—INDUCTION MOTORS.

The alternating current system, with its induction motor service, offered practically the only alternative to those engineers and manufacturers who did not care to be troubled with the petty annoyances and delays likely to occur at any time with the direct-current motor. The induction machine as it stands to-day is probably the most perfect motor yet developed from the standpoint of electric transmission in factories and mills. It may be started and operated from any point at any time, at practically any load and speed within its predetermined ranges. It may be used on 110, 220, 440 or 550-volt alternating current circuits of one, two or three phases. It does not require any direct-current supply as the synchronous motor does for its field excitation. It does not require any brushes, commutator or collecting rings. Offsetting these advantages, however, are certain restrictions. The speed of an induction motor falls off slightly as the load is in creased. The ability to start an induction motor from rest under a heavy load, as well as the possible speed changes during its operation, are obtained at some sacrifice of efficiency.

Induction motors, moreover, permit of higher lineal speeds than are possible with any other type, from 6,000 to 7,000 feet not being infrequent. By suitable arrangements of its field windings, this type of motor may have its speed altered in regular steps, so reducing it one-half, one-quarter, one-eight, etc. This makes possible similar changes to gear-wheel combinations, which may therefore be eliminated to the extent that the induction motor is installed to effect such changes. In almost all cases of shop driving, the slip is not objectionable, any more than the increasing slip of the driving belt as the load is thrown on. These motors will standalmost any amount of rough usage and heavy overloads, as they cannot be burned out. If excessively overloaded, the motor slows down and stops, starting up immediately as soon as the load is lightened. Ordinarily, machine tools and almost all classes of shop machinery are started at quite light loads, and the full load is thrown on when the work or the tool is up to the speed desired. For this class of work the induction motor seems specially fitted.

A larger generating power plant is required for an installation of induction motors than would be the case if direct-current motors were used. This is on account of the energy which is lost in all classes of alternating current circuits in which there is considerable self-induction, whether in the transmission wires or in the appliances used. In the case of induction motors this loss is very appreciable at light loads, becoming much reduced at average and heavy loads, at which it is almost uniform.

### SYNCHRONOUS MOTORS.

Synchronous motors are admirably adapted to factory service where absolute uniformity of speed is required, and where the extra installation of a direct current supply for their field excitation is not deemed objectionable. While induction motors are always wasteful of some energy, through their high self-induction, synchronous motors may on the other hand be brought into that condition of operation practically equivalent to the use of direct-current motors, at least for a large range of their loads. In other words, the power factor of a synchronous motor may be made almost anything from zero to unity, according to the extent of excitation of its fields by the direct current applied for this purpose.

When made in the revolving field type, synchronous motors are self-starting from rest at light loads. They may be very heavily overloaded, without falling out of synchronism or out of step, and when they do for an instant they may be brought back again by throwing off some of the load. A well-designed synchronous motor will carry at least three times its full normal load, and not drop out of step. If an induction motor is built for such overloads it is likely to have quite low efficiency at ordinary loads.

Higher efficiencies may be obtained with synchronous motors than with induction motors of the same output. In fact, such motors realize the ideal conditions of motor working in which the motor attains almost the same efficiency as the generator. Both induction and synchronous motors have usually higher efficiencies than direct current motors of same size.

COMBINED INDUCTION AND SYNCHRONOUS MO-TOR WORKING.

The ideal conditions in a factory installation no doubt would be secured where both induction and synchronous motors were used the former for small machines and direct driving, the latter for operating a set or group of machines. The synchronous motors would be started up just before beginning the work of the day, have at all times a light constant load, and might easily be so regulated as to produce an almost balanced system in combination with the induction motors. In such a system of transmission the lagging currents of the induction motors would be offset by the leading currents of the synchronous motors, if the latter were operated to produce such leading currents. The whole system would be operated practically throughout quite a range or load variations, as if it were a simple directcurrent system. The advantage of such a condition is apparent; it means least installation for any given output, or greatest output for any given capacity of generating plant. The group method of electric driving is much better adapted for small machines, up to and including 2 horse-power capacity, and especially where such machines are in almost constant service. Above this size, individual motor driving becomes more and more efficient. particularly if the machines are operated only a fraction of the day.

Last week at Leeds, Eng., an armored road train constructed for the War Office, was tested. The officers present at the trial claim the invention marks a great advance in military science. The armor is half an inch of nickel and steel, and it is proof against bullets and shell splinters at a distance of twenty yards. Each of the three trucks of the train carries one 4.7 naval gun. The trial, which was made under severe conditions, was completely successful, and the train has been shipped to South Africa.

#### THE PARIS EXPOSITION.

(Special Correspondence of ELECTRICITY.)

#### Distribution of Electrical Energy at the Exposition.

In our last letter we described the producion of energy. We will now explain the principal distribution of current for the different sections of the Exposition.

First—Continuous current is distributed during exhibition hours to the electrical machine groups.

- a. To the interior of the Palais du Champ de Mars for motive power and for lighting purposes through a conduit containing three conductors; the average tension is about 220 volts.
- b. To the interior of the Palais des Invalides for motive power only through a conduit containing two conductors, the average tension is 500 volts.

Second-Alternating current, single-phase, during lighting hours only, for the whole exterior illumination of the Palais du Champ de Mars the average tension is 2,000 volts primary and 110 volts for the secondary currents. Frequency 50.

Third—Alternating tri-phase current is distributed:

- a. During exhibition hours to the electrical machine groups under an average tension of 2,000 volts primary and 110 volts from the secondary. Frequency 50. In the Jardins du Champ de Mars, in the Jardins du Trocadero, on the Quais Debilly, and for that portion bordering on the Jardins du Trocadero.
- b. During lighting hours only on the Quais D'Orsay, from the Exposition grounds down the river, to the Alma bridge, under a tension of 2,000 volts primary and 110 volts secondary. Frequency 42.

On the Quais D'Orsay from the Alma bridge around to the bridge of the Invalides with a tension of 4,800 volts primary and 110 volts secondary. Frequency 50. In the Palace and quincunx of the Invalides to those portions lying between the longitudinal axis and the Constantine street with a tension of 2,000 volts primary and 110 secondary. Frequency 50. The section of the left bank of Paris, in the Jardins du Champ de Mars, and the Quais D'Orsay, for that portion lying between the Alma bridge and the bridge of the Invalides, a common alternating current of 3,000 volts primary and 110 volts secondary. Frequency 42.

The section of the Champs Elysée furnished are those portions of the Jardins du Trocadero contained between the Palais and the Boulevard Delessert as well as the Cours-la-Reine, which is supplied by a common alternating current, of the same tension and frequency. Current is always to be obtained from these two sources.

Electric power is furnished free for the operation of apparatus on exhibition. In all other cases the tariff is one-half franc per kilowatt hour for motive power, and 1 franc per kilowatt hour for lighting purposes. However, a rebate is allowed for lighting purposes over and above 800 hours meter measure. After this consumption is reached the consumer pays one-twentieth of a franc per hectowatt hour.

#### An Illuminated Fountain Without Water.

Besides the great illuminated cascades of the Chateau d' Eau, which are so much admired at the Exposition, we can now announce the possibility of constructing illuminated fountains without water, which is now being undertaken

at the Exposition in the Jardins du Trocadero.

The managers of this enterprise have asked Gustave Trouvé, the widely known constructing engineer, to install for them something of interest and out of the ordinary line. This project is to be a large illuminated fountain, six to seven meters high, but in solving the problem the economically disposed managers desire to evade the expense of water rates by the hour, and insist that M. Trouvé, should find something much cheaper than water. He solves the problem in the following manner: Above a large basin with a base inclined toward the center is placed a powerful electric ventilating fan, and above this is a tube conforming in size and dimensions to the desired fountain. The ordinary arc-lamp sends reflected light rays at right angles through the transparent tube. The electric lamp does not light up drops of water, but a predetermined quantity of rice grains mixed with mica and particles of tinsel. This mixture is blown through the tube by the fan, and finally falls sparkling into the basin to be again taken up by the current of air, and so on over again.

A disk containing glass of various colors is placed above the tube, and is turned by an electric motor, which impregnates the moving reflecting particles with light and causes a great variety of light effects.

The result is indeed very surprising, and natural results are well imitated; this is the way an illuminated fountain can be built without using any liquid.

# The City of Geneva at the Paris Exposition of 1900.

The City of Geneva is to exhibit at Paris, in the Salon d'houneur of the Swiss section of electricity, a plan in relief of its two electric generating stations of Coulouvreniere and Chevres. These designs will be on a scale of 1—259; they have only just been finished and are now being shipped to Paris. They are the work of M. Jacob Maurer.

# Congress of Applied Chemistry.

The Fourth Congress of Applied Chemistry will hold its next session in Paris, from July 23 to 28. It is composed of ten sections. The last section is devoted to the science of electrochemistry, and its session will be of particular interest to electricians. The organization committee of this last section is made up as follows: President, M. Henri Moissan, member of the Institute; vice-presidents, MM. Besnard, who is vice-president of class 75 of the Exposition of 1900; Bethmoul, counsellor to the Courdes Comptes; Bullier, member of the administrative council of the Metallurgical Society; Gall, administrative delegate from the Society of Electro-Chemistry; Lippmann, member of the Institute; secretaries, MM. Lebeau, professor of the Pharmaceutical High School; Minet, electrical engineer. The work outlined for this section is as follows: Batteries, dynamos, accumulators; galvanoplastic materials and general manipulations; the manufacture of ozone, chlorine of soda, chloride of potassium and of sodium; perchlorates, bioxides, persulphates; electrolytic production of metals, copper, nickel and chrome, lead, vanadium, etc.; aluminum and its alloys; the working of aluminum; the employment of aluminum as a reduced agent; magnesium, sodium and its alloys; organic compositions; electric smelting; phosphorous, graphite, manganese, tungsten, molybdenum, lithlum, etc.; manufacture of carborundum; carbide of calcium, its preparation; industrial furnaces, their management; purity of carbide, its transportation by railroads and boats; manufacture of acetylene, ways of using it; purification; models of apparatus, burners, acetylene black; rules and regulations; bleaching, purification of sewerage and treatment of sugar.

# LONDON NOTES.

[From our London Correspondent ]

## The Underground and Electric Traction.

In the course of his James Forrest lecture to the Institution of Civil Engineers, Sir Wm. H. Preece touched upon a variety of topics which may or may not have had a connection with his title, which was "The Relations Between Electricity and Engineering." Perhaps the most interesting part of the lecture, so far as practical electrical engineers are concerned, is that part which deals with the electric traction experiments on the Metropolitan Railway, for which he is one of the expert advisers. His remarks were as follows: A bold attempt is being made by the Metropolitan railways, to work the existing line in such a way as not to interfere with the present traffic or even with the permanent way. A new train of six coaches weighing 180 tons, having a motor car at each end weighing 54 tons, is about to run between Earls Court and High street, Kensington, Each motor car is mounted on bogies, and each bogie has two electric motors, so that there are eight driving wheels, each bearing 675 tons. The driving wheels have diameters of 47 inches. The length of the train is 240 feet. Each motor is rated at 200 hp., or a total of 800 hp. for each motor car. But there is a wide margin, and we have already applied 950 hp. in starting a load of 270 tons on the incline of 1 in 43. Electric traction has an immense advantage over steam traction in impressing a continuous and uniform torque or turning moment on the shaft, and consequently a continuous and uniform effort on the trend of the wheel. The action of the steam locomotive is intermittent and the bite not continuous. Hence such frequent slipping on greasy rails. Again, the maximum torque can at once be applied by the current, and, in combination with the constant effort, it increases the acceleration so that a train acquires its maximum speed much more quickly We shall increase the mean speed of the Metropolitan trains from 11 miles per hour to 15, and thereby increase the capacity of the line over 30 per cent. The stoppages on the underground railways are so frequent that the trains ars always either accelerating or stopping. They never reach their top speed as they do on main lines. Electric traction enables them to start quicker and stop more promptly. On the Metropolitan the 180-ton train acquired 20 miles an hour in 200 feet, and, when going at the same speed, it was stopped in 130 feethalf its length. Smart work on such a railway depends on the rate at which trains can be emptied and filled. The English system of compartments and side doors facilitates this. It would be still further expedited if we could have one platform for entry and one for exit, and one class only.

The Liverpool and Manchester Lightning Express Railway, promoted by a very powerful representative syndicate of those two great commercial centers to carry out the scheme of Mr. Behr, is a very bold and promising venture. The line is to be mono-rail, 34 miles long, directly between the two cities, without any intermediate station, and with no crossing. There are to be cars every 10 minutes. The speed is to be 100 miles per hour, and the time

of transit 20 minutes. I know of no reason why this should not be done with safety and comfort.

The automobile car of the future has not yet seen the light. It will be electrical. Immense p ogress has been made in motors and in batteries. Lundell has shown how to store up the energy now wasted in descending hills, and to recover some of that absorbed by the inertia of the car. Although a battery has already been able to drive a car 100 miles with one charge, we are waiting patiently for the real automotor storage cell.

## Prof. Geo. Forbes on Power Transmission.

On April 26 Prof. Forbes, F.R.S., read a paper before the Institution of Electrical Engineers in London on "Distant Electric Power Transmission." The first part of the paper was devoted to the description of certain selected transmission plants, each one put up by a different contractor and each one having some special point of interest. Although the only one with which he is practically and intimately acquainted is the plant at Niagara Falls, the plans of which were prepared by him in 1890 and carried out between that date and 1895, and the actual working of which he has thoroughly investigated up to the summer of 1899. The second part of the paper dealt with some of the problems that face the consulting engineer in his attempts to introduce the highest economy, especially in the transmission lines, as this is the most important part when the distances are great. To these two sections Prof. Forbes added some remarks giving a general view of the methods in use by different contractors.

# THE INSTITUTE MEETING.

# Carl Hering, the Newly-Elected President, Presides at the Philadelphia Meeting—The Officers.

The American Institute of Electrical Engineers held its first session in the main auditorium of the Drexel Institute, Philadelphia, on Wednesday afternoon, May 16. From 100 to 150 delegates were in attendance.

The meeting was addressed by Mayor Ashbridge, of Philadelphia, and was responded to by James McAllister.

The papers read were two in number—"A New Transmission Dynamo-meter," by Prof. W. Elwell Goldsborough, and "A Percentage Bridge," by Herschel C. Parker.

At 3 o'clock a ladies' party left Arch street wharf on a trip up the Delaware River, landing at the Morrelton Club Inn at Torresdals, where a planked shad dinner was served.

In the evening the delegates attended a smoker at the Manufacturers' Club.

# THURSDAY, MAY 17.

The meeting was called to order by Dr. Carl Hering, the newly-elected president.

Dr. A. E. Kennelly presented a report of the Committee of Units and Standards, which was discussed and accepted.

Fitzhugh Townsend, of Columbia University, read a paper on "Eddy Current Losses in Transformers." His explanation of these losses was based on experiments made in the laboratory of the University.

Samuel Sheldon, of Brooklyn, read a paper on the "Conditions of Electrolytic Corrosion in Brooklyn." A lengthy disscussion of the paper ensued.

At 1 o'clock the steamers Wm. J. Latta and the Relief took the visitors up the river to Cramps' shipyard, and returning to Arch street

wharf, picked up the late comers and continued down the river past League Island Navy Yard to Washington Park. There they partook of a planked shad dinner.

# FRIDAY, MAY 18.

The first paper presented was by F. A. C. Perrine and F. G. Baum, entitled "The Use of Aluminum Line Wire, and Some Constants for Transmission Lines." Particulars of a test of aluminum wire for a conductor were given in comparsion with copper. The tests were made on a line forty miles long. The chief advantage was in the weight, which was just half that of copper for the same conductivity. Its strength, however, was much less and its area more than a half greater, which were objectionable. One member said that it took four linemen all the time to repair the breaks.

Prof. Albert C. Crehore and Captain George O. Squier, U. S. A., read a paper on "A Practical Transmitter Using the Sine Wave for Cable Telegraphy, and Measurements with Alternating Currents Upon an Atlantic Cable." These gentlemen used an alternating current of electricity with a sine wave, cutting out one-half of the period of alternation and using either the positive or negative side. It was claimed that on experiments last year over one of the Atlantic cables a marked improvement was made, with the same receiving instruments as were in use by the cable company, by the use of the new transmitter. No figures were given to show the speed of transmission attained.

The limitations of speed on cables came up in another form in a paper read by Prof. M. I. Pupin, of Columbia University, the title being "Telephony Over Cables and Long Distance Air Lines." President Hering remarked that seven years ago it had been prophesied in a paper read before the Institute that telephones would be used over the Atlantic cables. That prophecy had not so far been fulfilled. The last paper was by Prof. R. B. Owens, entitled 'Notes on Synchronous Converters," at the conclusion of which the meeting adjourned.

Before adjournment a resolution of appreciation of the courtesies of the Drexel Institute was adopted.

# The Newly-Elected Officers.

At the annual meeting held in New York City on May 15, the following officers were elected for the ensuing year:

President-Carl Hering.

Vice-Presidents-Gano S. Dunn, Arthur V. Abbott, W. L. R. Emmet.

Managers-W. S. Barstow, Calvin W. Rice, Cary T. Hutchinson, Ralph D. Mershon.

Secretary-Ralph W. Pope.

Treasurer-George A. Hamilton.

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended May 19:

Antwerp, 20 cases, \$2,828, 11 packages, \$375; Argentine Republic, 33 cases, \$2,216; 180 packages, \$7,973; 18 cases electrical motors, \$2,625; Barcelona, 110 packages, \$7,751; Brazil, 124 cases, \$3,542; Bristol, 114 cases; \$11,139; Brussels, 27 packages, \$689; British Guiana, 21 packages, \$867; British East Indies, 42 packages, \$5,991; British Possessions in Africa, 45 packages, \$2,627; British West Indies, 10 cases, \$146; Central America, 83 cases, \$831; Chili, 4 cases, \$58; Cuba, 401 packages, \$20,061; Dunkirk, 2 packages, \$375; Genoa, 9 cases, \$1,538; Glasgow, 23 packages, \*921; Hamburg, 56 cases, \$6,750; Havre, 182 packages, \$19,639; 2 cases, \$634; Ipswich, 121 packages, \$12,502; Liverpool, 48 packages, \$2,778: London, 227 packages, \$9,-041; 1 case, electrical instruments, \$880; 2 boxes electros, \$134; Manchester, 2 cases, \$1,200; Margate, 112 packages, \$21,127; Marseilles, 19 packages, \$1,163; Mexico, 52 packages, \$6,138; Peru, 205 cases, \$5,242; Philippines, 19 cases, \$5,790; Rotterdam, 4 cases \$69; Southampton, 9 cases, \$233; U. S. Colombia, 9 packages, \$92.

## LEGAL NOTES.

In the Equity Court of Adams County, Pa., Judge Swope recently handed down his decision in favor of the Keystone Electric Light, Heat & Power Company, in the proceedings between that company and the Gettysburg Transit Company The two companies have been at war for three years over the ownership of the electric lighting plant operated by the Transit Company.

A summons and complaint against the First National Bank of Adams, Mass., has been filed in the County Clerk's office at Albany, N. Y., by the Municipal Telegraph Company. The company claims to have a deposit in the bank, and alleges that the bank has refused to honor certain drafts.

# INCORPORATIONS.

The Federal Electric Company, New York City, Directors: Benjamin Blum and Nathan Blum, New York City.

The Suburban Electric Railway Company, Columbus, O. Capital stock, \$150,000. Incorporators: P. Jones, G. W. Dunn, E. Denmead, A. L. Thurman and A. W. Field.

The Balzer Motor Company, New York City-to manufacture and deal in motors and engines and to acquire inventions, patents and other rights. Capital stock, \$1,000,000.

The Richmond Electric Company, Richmond, Va. Capital stock, \$100,000. The officers and directors are all Richmond capitalists, except Vice-President Joshua Hale of Newburyport, Mass.

The Consolidated Water & Light Company, Chicago, Ill. to construct water, gas, electric light, heat and power plants. Capital stock, \$100,000. Incorporators: John H. Brown, B. O. Meyer and M. T. Cook.

The Shasta Electric Light & Power Company, San Francisco, Cal. Capital stock, \$1,000,000. Incorporators: G. A. Knight, C. A. Warren, C. E. Green, F. S. Edinger, F. S. Knight, all of San Francisco.

The General Illuminating, Heat & Power Company, Norwood, O.—to manufacture electricity and gas for light, heat and power. Capital stock, \$100,000. Incorporators: C. W. Baker, V. E. Heintz, W. B. Stier, A. C. Nagle and M. G. Heintz.

The Shore Electric Light, Heat & Power, Company, Pleasantville, N. J. Capital stock, \$25,000, Incorporators: B. H. Shivers, C. H. Mann, G. B. Nye, W E. Hunt, all of Haddonfield: E. Tredick and H. L. Moulton, of Philadelphia, Pa.: P. B. Riseley, of Pleasantville; W. S. Wright, V. F. Lake, A. P. Risley, Atlantic City.

The Lockport and Newfane Power & Water Supply Com pany, Albany, N.Y.-to develop and employ hydraulic and electrical power, the generating, sale and distribution of the same, and the supplying of pure and wholesome water to cities and towns within Niagara County. Capital stock. \$500,000. Directors: Henry J. Pierce, Burt Van Horn of Buffalo, Willard T. Ransom, John A. Merritt, Harry L. Ransom, Senator Timothy F. Ellsworth of Lockport and William B. Rankine of Niagara Falls.

# COMMERCIAL PARAGRAPH.

The Chicago Fuse Wire & Mfg Company has recently moved their general office to its factory location at 58 to 64 North Jefferson street, Chicago. Owing to the largely increased business which the company has enjoyed during the past year or two it has found it necessary to increase its manufacturing facilities, and has equipped a department for the manufacture of its well known and popular line of Tested Fuse Wire and Fuse Links, in connection with the Springfield Drop Forging Company of Springfield, Mass. The company's many friends and customers in the East will appreciate this move, as it indicates progressiveness and a determination to give the trade the best possible service. The Chicago Fuse Wire & Mfg. Company informs us that all shipments for the Eastern States will hereafter be made from

the Springfield factory. It may be of interest to the trade to know that Mr. A. D. Dana, president of this company, is now treasurer and general manager of the Springfield Drop Forging Company, while Mr. W. R. Goodman, who has been well known in connection with the fuse wire line for the past twelve years, will continue to look after the interests of the business from the main office at Chicago,

# ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A MICHEL Solicitor and Attorney for AMERICAN AND FORBIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Palents. Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upo ment of ten cents. When ordering give name, date and title of invention wanted,

#### LETTERS PATENT ISSUED MAY 15, 1900.

# ELECTRIC RAILWAYS AND APPLIANCES.

- 649,168. Trolley, James H. Morey and Thomas R. Watkins, Trenton, Mich. Filed Aug. 7, 1899.

# GENERAL NEWS.

# What is Going On in the Electrical World.

#### LIGHTING.

Antigo, Wis.—W. L. Elliot, proprietor of the electric light plant, contemplates the purchase of a new engine, and two 2,000 candle power dynamos.

Avoidale, Pa.—There is talk of establishing a new electric light plant at this place.

Buffalo, N. Y.—Julian E. Woodwell, the electrical engineer of the Treasury Department at Washington was here a short time ago working in conjunction with Superintendent of Construction Otto G Simonson on calculations and preliminary plans for the installation of a plant in the new post office building to generate power for lighting the building with electricity, and for such other purposes as may be found necessary.

Cape Vincent, N. Y.—The citizens of this place are in favor of establishing an electric light plant here.

Colina, O.—The council recently passed a resolution submitting the question of issuing bonds in the sum of \$25,000 for the purpose of putting in an electric light

The electric light plant here was Converse, Ind. partially destroyed during a recent storm

Dolton's Station, Itl.-This village is preparing to erect a new electric light plant.

Ephriam, Utah.—The city council has appointed a special committee, consisting of Councilor Larsen, John D. rins, Jr., C. A. Larsen. Peter Thompson and David P. Madsen to make investigation as to the city putting in and operating an electric light plant.

Grant Park, Ill.—The electric light question is being discussed here.

Halstead, Kan.—There is some talk of putting in an e'e ctric light plant here.

Hartford, Mich.—Auderson Brothers have decided to ins all an electric light plant at this place, and work will begin at once.

Helens, Mont.—The citizens here have voted to sue bonds for the purpose of erecting an electric light plant.

Hillsboro, Tex -The council is considering the ques-

tion of erecting an electric light plant at the place.

Kingston, N. Y.—The West Shore Station at this place is to be lighted with electricity.

Lakeview, Ore.—Bids are asked until Ju'y 19 for the purchase of \$10,000 in bonds for erecting an electric light plant. Address Chas. Umbach.

La Porte, Tex —I. Beck is interested in a company which will erect an electric light plant in this city.

Laurel, Dal.—This place will soon have the modern advantage of a complete electric lighting system.

Liveland, Col.—The city council has issued bonds for the purpose of erecting a municipal electric light plant. Address C. C. Bushnell.

North Brookfield, Mass—E. A Bachellor, L. S. Woodis, D. A. Clark and P. J. Daniel have been appointed a committee to secure plans etc., for a municipal electric light plant to cost \$10,000.

Ocion, Ill.—R J Fullerton, a former Rock Islander, who is now a resident of this place, has been delegated by the town board to investigate the cost of installing an electric light system.

Park River, S. D —This town is considering the question of erecting an electric light plant. J. Wyllie, mayor.

Port Gibson, Miss.—This city will put an additional dynamo in its electric lighting plant to increase the

Sabring, O—H. H. Whitacer has prepared plans and specifications for a new electric light plant to be erected at this place in the near future.

Tonawands, N. Y.—The board of trustees of this village has voted to abolish gas and substitute electricity for public lighting.

Virginia. Ill.-The matter of erecting a village electric lighting plant is being discussed here.

Wappinger's Falls, N. Y.—This town has engaged W. M Sheehan of New York to prepare plans for a municipal electric light plant.

Woodbury, Pa.—The introduction of gas and electricity is among the contemplated improvements for this place.

Woodsville, N. H.—H. S. Coolidge contemplates the erection of an electric light plant at this place.

# STREET RAILWAYS.

Alleghan, Mich.-David Cornwell of Monterey and Milcon D Owen of this place have been granted a franchise by the township board for an electric street railway along the Monterey road north.

Atchinson, Kan.—A project is being considered here in regard to the construction of an electric railway connecting the towns of Doniphan, Troy, Highland, Severance. Wathena, White Cloud, and other Doniphan County towns with this city.

Chicago, Ill.—By permission of the municipal authorities here, the Chicago, Milwaukee and St. Paul Railroad is to establish and operate three new trolley

lines within the limits of this city, tapping the north shore of Lake Michigan as far as Llewellyn Park on the northwest side. These additional suburban lines will have a total mileage of 30.07 and will cost about \$450,000. This will give the St. Paul road control of the suburban business of the entire northwest territory in thickers. in Chicago.

Cleveland. O .- The Little Consolidated Company of this city has arranged to change the cable to electricity for the entire Superior street line.

Columbus, O.-The Columbus Suburban Electric Bailway Company was recently incorporated for \$150,000 by P Jones, G. W. Dur, E. Donmead and J. Ross. The company will construct and operate an electric railroad between this city and Dublin.

East Liverpool, O—The right of way for an electric railway to be built between this city and Vanport. Pa., a distance of 14 miles, has been secured, and work on the new road will begin soon.

El Paso, Tex.—The street railways in this city have consolidated. The one company is to be known as the El Paso and Juarez Traction company, which is capitalized at \$200,000. The purpose of the new concern is to establish electricity as the motive power and abandon the old mule car system.

Evansville, Ind.—The survey of the route for the electric line between here and Boonville has been com-pleted and work will begin at once.

Jersey City, N. J.—The North Jersey Street Railway, which owns most of the street railways in the northern which owns most of the street railways in the northern part of this State, is planning to put through its projected trolley line from this city to Philadelphia as rapidly as possible It is asserted on good authority that all of the lines of the syndicate will be joined and that an entrance will be gained to New York City from the north. The new line will join the Huckleberry road, which is a part of the Third Avenue system.

Keene, N. H.—It was recently decided to build electric railroads here, and out as far as Marlboro Village. The storage house for the cars is to be at South Keene. G. G. Davis of Marlboro is interested.

Lebanon, Ill.—The movement by the Commercial Club of this city for building an electric railway between East St. Louis and this place via O'Fallon is progressing favorably. S. Smiley of O'Fallon has obtained a large part of the right of way.

Lexington, Ky.-The State College students have completed a survey for an electric railway to connect Nicholasville with this place. The estimated cost of the construction will be nearly \$100,000. The distance is 12 miles.

Los Augeles, Cal.—The Terminal Railroad Company will ask for a franchise to have its electric line from Pasadena enter this city.

Newark, N. Y.—The Newark & Marion Railway Company was lately incorporated with \$100,000 capital stock to construct a street surface electric road 8 miles long in this place. The directors are E. V. Pierson, long in this place. The directors are E. V. Pierson, F. D. Burges, of Newark; C. L. B. Tylee, of Penn Yan, and C. H. Scott, of Marion.

Penn Yan, N. Y.—The long talked of electric rail-road betwean this village along the east side of Keuka Lake to Hammondsport, a distance of nearly 25 miles, seems now to be assured, and will probably be in operation this fall.

Rahway, N. J. -Many citizens of this place are now anxious to have Rahway and Elizabeth connected direct by trolley, and it is understood that an affort will soon be made in that direction.

Springfield, Mass.—Capitalists of this city and Hart-ford will attempt to connect the two cities by a trolley line this summer.

# MANUFACTURING.

Pittsfield, Mass.-The Stanley Electric Manufacturing Company will expend about \$370,000 in the construction of its new plant in this city. The company has recently received a large number of small orders, has recently received a large number of small orders, and with the present capacity of the works it is impossible to keep up with them. Two large generators of 3:0 kilowatts each, and a special switchboard were lately shipped to Et Paso, Tex., and will be used in that city for municipal lighting.

Stranton, Pa.—A short time ago the Metropolitan Electric Company awarded the contract for a 1000 horse power vertical Cross compound engine to the Dickson Engine Company of this city. The new engine will be installed in the plant on South 7th street about the 1st of October.

about the 1st of October.

Syracuse, N. Y.—Henry Eager recently returned from New York, where he had been in the interest of A. C. Powell & Son, manufacturers of dynamos and motors. He closed several contracts which, with other business contracted for at home, will keep the firm busy for several months. The facilities for lurning out electrical apparatus have been enlarged.—The Prismatic Electric Sign Company of Williamsport, Pa., has moved its factory to this city where it will concontinue the manufacture of signs. The invention is that of C. H. Hill, who was formerly superintendent of an electric light concern and now resides in Syracuse.—R. M. Cornwell and F. M. Smalley of this city are the directors of the R. M. Cornwell Company, recently formed here to manufacture electrical supplies, with a capital of \$20,000. with a capital of \$20,000.

Waterville, Me.-C. W. Davis, of this place, D. A.

Proctor, T. H. Bibber, D. W. Dunn, all of Boston, Mass., and E. L. Brown, of Waltham, are the incor-Mass., and E. L. Brown, of Waltham, are the incor-porators of a company formed here lately, known as the Federal Wire Company for the purpose of manu-facturing and dealing in wires for electrical work.

#### COMPANY MATTERS.

Chicago, Ill.—The American Electric Wire Company of this city has increased its capital stock from \$5,000 to \$15,000.—The contract for the new electric light plant and waterworks system at Two Rivers, Wis., has been let to C. A. Inglehart & Co. of this city for

Colchester, Ill.—The electric light company of this place is about to install new machinery that will furnish nearly double the power of the plant now in use

Corpus Christi, Tex.—The Corpus Christi Electric Light Company will improve its plant. E. A. Born, manager.

Grand Bapids, Mich.—The power house of the Grand Bapids Electric Light & Power Company was recently destroyed by fire. Loss \$20,000.

Indianapolis, Ind.—The Indianapolis Light & Power Indianapolis, Ind.—The Indianapolis Light & Power Company will put in a storage battery in the Lyracasino Building on Meridian street. Its complete cost will be \$9,000. The battery will have 156 cells, 24 feet wide and 5 feet deep, each of which will contain 51 plates, and weigh 5,000 pounds. With this battery a uniform voltage will be maintained on the entire system. Should a break-down occur at the power house the battery is of sufficient power to furnish light for the city. the city.

New Haven, Coun.-The Meriden-Southington Company and the Connecticut Lighting & Power Company have finally arrived at an agreement, whereby the latter company will be permitted to use the poles of the former in bringing in the feed cables from New Britain to be used for furnishing the town with electric lights.

Philadelphia, Pa.—By a recent transaction the Consolidated Electric Company of this city obtained control of the electric light plants in O.l City and Frank-

Pipestone, Minn.—The Pipestone Electric Company has been reorganized under the name of the Pipestone Electric and Construction company. The management of the entire plant will be in the hands of J. McNerny, of Minneapolis.

Reading, Pa.—The Arrowsmith Electric Company, Limited, has leased the property, 446 Penn street, and will move about June 1.

# POWER AND TRANSMISSION PLANTS.

Bellefonte, Pa.—A number of capitalists of this place are considering a project for the harnessing of Spring Creek at a point in the gap of Muncy Mountain in order to secure power for the operation of a large electrical plant at Milesburg. The purpose is to furnish the current sufficient to operate a trolley line through the streets of Bellefonte and between this place and Milesburg, with the probability of extension west to Philipsburg and south across the Saven Mountains to Lewistown. tains to Lewistown.

Buffale, N. Y.—The board of directors of the Expo Buffale, N. Y.—The board of directors of the Exposition Company has authorized D. rector General Buchanan to conclude with the Niagara Falls Power Company and the Cataract Power & Conduit Company contracts under the best terms and conditions possible for 5,000 horse power, at a sum not exceeding the amount named by the companies in proposals which they submitted to the Exposition Company some time ago. The power will be transmitted from the terminal station of the Cataract Power & Conduit Company at Ontario and Niagara streets to the Exposition grounds, where a transformer house will be built.

Canon City. Col.—The Electric Power Company

Canon City, Col.—The Electric Power Company whose large plant in this city supplies power and light for many of the mines in the Cripple Creek district, is preparing to double its capacity.

San Francisco, Cal.—The Yuba Electric Power Com-San rencisco, Cal.—The Yuba Electric Power Company, represented by Engene de Sabla, Jr., of this city, has made application to the board of supervisors for franchises to run lines into Yolo, Solano, Contra Costa and Alameda Counties for transmission of electricity for power and lighting. The company is incorporated for \$1,000,000, and is headed by R.R. Colgate of Naw York.

Trenton Falls, N. Y .- The Utica Electric Light & Power Company is pushing the work of harnesing the power of West Canada Creek at this place, and expects to get its lines to Utica by next fall. Several thousand horse power will be carried to Utica by wire.

# AUTOMOBILES.

Elizabeth, N. J.-A project is now on foot toward the establishment of an automobile coach line to run be-tween this place and Morristown, a distance of 18 miles. It is stated that the auto-coach can easily make the trip in an hour and a half.

Minneapolis, Minn.—The automobile is making its way in this city. Five of the ten that were ordered this spring arrived lately and are now in use. The others are expected soon.

St. Louis, Mo.—This city has recently started to run an automobile for public transportation. It is operated by electricity.

# THE TELEPHONE WORLD.

#### Opposition to the Bell in Buffalo.

The Bell Telephone Company is to have opposition in Buffalo, N. Y.

This statement has been made time and again for several years past, but each time the opposition has failed to materialize. This time, however, there seems to be not the slightest doubt that opposition is to become a certainty.

The opposition is the Buffalo Telephone Company, capitalized at \$500,000, and having such men as George K. Birge, Daniel N. Lockwood, Charles E. Williams, Leonard B. Crocker, W. H. Kinch, William B. Hoyt, Augustus F. Scheu, Frank L. Bapst, and Reuben J. Getz on its board of directors.

Two years ago this same company put in an application to the common council for permission to lay conduits, string wires, erect poles, etc. The application was sent to the committee on streets where it has since laid dormant.

The reasons for not pressing the application at that time were probably that there was no possible hope of getting a favorable report from the common council,

About a month ago the idea of renewing the application dawned upon the backers of the new company when certain Eastern capitalists came to Buffalo and looked over the ground with a view to installing a competitive telephone company. These capitalists are the same ones who have successfully started "home" companies in Trenton, N. J., Syracuse and other cities.

Then it was that the local company was aroused. Subscription blanks were gotten out, and a large force of solicitors put at work. To day the company claims to have the signatures of 1,000 prospective subscribers.

The Southern New England Telephone Company is about to inaugurate a rather unique feature in its system in the shape of a sanitary mouthpiece for use on the transmitters in all public stations. These little mouthpieces are described as "positive preventive of dirt, disease and disagreeable odors." It is the purpose of the officials of the company to so distribute these mouthpieces at public stations that each user of such a public telephone may talk into a new and clean one. In other words, a mouthpiece will be used once and thrown away. The mouthpieces were invented and patented in the offices of the company. They are made of a special white paper, and are odorless. Private subscribers can purchase the mouthpieces, while of paper, transmit sound distinctly.

The Georgia Telephone and Telegraph Company has opened its exchange in Savannah, Ga. It already has some 500 subscribers and new names are being added to the list. There is a capacity on the switchboard for 1,200 subscribers, and orders have been placed for two more sections, each to have a capacity for 300 lines. This apparatus will readily respond to orders for connections promptly, and the officers of the company think it by no means unlikely, so confidently do they rely upon the efficiency of the service they will give, that it will not be long before there will be 1,800 subscribers' lines in use. Nearly all the connections now made are in the business section.

A despatch from Topeka, Kan., states that the State board of telegraph and telephone assessors have divided telephone exchanges into three classes for assessment and fixed a valuation rate that will raise taxes from 25 to 50 per cent. The Missouri and Kansas Company will be taxed \$1.25 for each pole, \$5 a mile for wire and \$5 for each instrument. The new toll lines in Southern Kansas, in the second class, will pay \$24 a mile for the first wire and poles, \$6 for each additional wire a mile and \$5 for instruments. The third class of exchanges will comprise what is known as the "barbed wire" exchanges through the country. They will pay 75 cents a pole, \$2 for iron wire and \$3 for instruments.

Vice-President H. S. Hyde of the New England Telephone & Telegraph Company, said that of the \$5.000,000 of new stock authorized from \$1.000,000 to \$2.000.000 will be issued this year, and the rest from time to time. The total increase probably will suffice for five years.

The United States Long Distance Telephone Company is now getting the right of way and building a copper wire cross-arm line from Columbus via Galloway, Georgesville, Lilly Chapel and London to Springfield, O.

A bill has been introduced in the Senate at Washington authorizing the commissioners to permit the erection of poles and the construction of telephone lines east of the Anacostia River in the District of Columbia.

Flemingsburg, Ky., capitalists have succeeded in organizing a telephone exchange for that place.

#### Meeting of Independent Companies.

Between seventy-five and one hundred managers of independent telephone companies of Ohio met in Cleveland recently. The object of the meeting was to discuss and become familiar with the best methods to be pursued in hurrying long distance calls. All of the independent telephone companies have entered into a contract with the United States Telephone Company, a corporation devoted entirely to long distance service, to act in conjunction with the latter. Most of the independent companies have different systems, and the meeting was for the purpose of becoming acquainted with these various systems, having in view a better long distance service, which will not be sacrificed to local business.

James M. Thomas, who is a leading official of the United States Telephone Company, scoffed at the report to the effect that the Bell system is absorbing the independent companies. "The first thing you will hear," said Mr Thomas, "will be when the other people absorb the Bell people."

# Bell Company Boycotted.

A boycott has been declared in Buffalo. N. Y., upon the Bell Telephone Company by the United Trades and Labor Council on account of the existing strike among the linemen. Orders were recently issued by John T. Butler, business agent, forbidding any union laborer who is affiliated with United Trades and Labor Council from talking over the 'phone. All union labor men have been notified of this boycott, and for every violation the person using the telephone will be fined \$50.

Railroad Commissioner Osborn, who is charged with enforcing the law relative to the stringing of wires across rati-road tracks in Michigan, is about to renew the inspection which was discontinued during the winter months, and entirely new specifications for the guidance of telephone, telegraph and other companies using electric wires have been prepared. The specifications provide for poles having a diameter of seven inches at the top and require that such poles shall be set in the ground from six to eight feet, according to the height of the pole, the object being to set the poles to such a depth that there will be no possibility of their being blown over by the wind. Poles shall not be set farther apart than one hundred feet at railroad crossings and must be provided with double cross-arms. All poles at crossings shall be safely guyed, and all wires crossing radroad tracks must be at least twenty-two feet from the ground. The increase in the number of wires crossing railroad tracks has greatly augmented the hazard to railroad employes and the commissioner desires to have them put up as securely as possible. Inspectors will visit the principal cities and towns of the State and see that the wires conform to the specifications of the railroad department.

The Capital Telephone Company has been incorporated at Jefferson City, Mo., with a capital stock of \$50,000. The company was organized by residents of Jefferson City, who propose to put in an exchange in competition to the Bell system operated by the Missouri & Kansas Telephone Company of Kansas City, and will furnish telephones at lower rates than the present system charges. The company will also build toll lines through the adjoining counties. The incorporators are Ed. T. Orcar, Sam B. Jeffries, A. M. Hough, Dr. J. P. Porth, Ed. R. Hogg, G. A. Fischer and Houck McHenry. The officers are Dr. J. P. Porth, president; Judge A. M. Hough, secretary, and Ed. R. Hogg, treasurer.

The board of aldermen of Worcester, Mass., have been petitioned by the Massachusetts Telephone and Telegraph Company, constituting the Massachusetts branch of the Telephone, Telegraph and Cable Company of America, for a right of way through certain streets of that city, which will form the connecting link in the new proposed long-distance line from Boston to Albany, Burfalo, Cleveland, Chicago and the northwest, and to New York City by the way of Springfield. With exception of that portion of the route which passes through Worcester, the company has the right of way for its pole line from Boston to the New York State line.

The State Department at Washington has received from Consul-General Guenther, of Frankfort, and Consul Hughes, of Coburg, reports to the effect that the annual charge for telephones in Wurtemberg has been reduced to \$19.04. The cost for a five minutes' talk over the local circuit is 1.19 cents; for a distance not exceeding 19% miles, 2.38 cents; up to 31½ miles, 4.76 cents; for longer distances, 11.9 cents.

"That telephone franchise should be extended and the promoters of the independent company allowed to go on and establish its system," is the verdict of the public at Binghamton, N. Y.

The Citizens' Telephone Company of St. Joseph, Mo., has increased its capital stock from \$100,000 to \$150,000.

## The Rochester Telephone Exchange.

The Rochester Telephone Company of Rochester, N. Y., has just opened its exchange. Perhaps the most attractive feature of the spacious exchange building is the switchboard. This is 861/2 feet in length, giving facilities for 3,600 subscribers, each of the thirty-six operators having one hundred subscribers in her section. The board is of the multiple type; that is, connections from the line of every subscriber in the system are brought within the reach of each operator, who can thus place any two subscribers in communication without delay. There is no jingling of bells at this switchboard. When a subscriber removes his receiver from the hook, a little opal lamp called a pilot-lamp, is lighted and the subscriber's number is thrown up, much as in the case of a cash register. A plug is inserted in the subscriber's number, and also in the number required, and communication between the two is established. When both subscribers have "hung up" a little red light appears. This is called the clearing out signal, and indicates that the subscribers are "through." Both plugs are then removed, and normal conditions are at once restored. At a separate desk sits a supervising operator, and at this desk both pilot-lights and clearing signal lights from every section of the board are duplicated, and the supervising operator also is in direct connection with every section of the board. In this way it is practicable to prompt service on the part of the operators at all times. The switchboard was constructed by the Stromberg-Carlson Telephone Manufacturing Company of Chicago at a cost of \$100,000.

## Capitalized for \$15,000,000.

The Pacific States Telephone & Telegraph Company has been incorporated at Portland, Ore.. with a capital stock of \$15,000,000. A portion of this stock will, it is said, be used for the purpose of acquiring all of the property rights of the different telephone companies of the Pacific States, including the Pacific Telephone & Telegraph Company of San Francisco; the Sunset Telephone & Telegraph Company of California and Western Washington, the Oregon Telephone & Telegraph Company, and Inland Telephone & Telegraph Company of Oregon and Washington, and a portion of Idaho.

A large portion of the new capital will be used for the immediate and extensive enlargement of all the several plants, the demand for telephones on the Pacific Coast, especially within the last two years, having far outrun the present facilities of the several companies, the net gain of subscribers to the different exchange systems on the Coast being at the rate of nearly 100 for every business day, the total number of such subscribers at this date being in round numbers 75,000, the large exchanges being San Francisco, with 19,000; Los Angeles, with 7,000; Portland, with 6,000; Seattle, with 4,500.

The principal office of the new company will be in Port

In New York telephone circles it is believed that the Telephone, Telegraph & Cable Company of America is interested in the negotiations for the acquisition of the franchise of the Illinois Telephone & Telegraph Company, which, according to rumor, is to be sold to an Eastern syndicate.

The prospects are said to be good for the early completion of the long distance telephone line into Tuscumbia, Ala., connecting Sheffield and Florence, which last summer was built as far as Cherokee, when work on the same was stopped.

Work has been begun on a telephone line from Lois to Scivally, Tenn. This line will give Scivally telephone connection with Lynchburg via Lois.

The Southwestern Telegraph & Telephone Company is placing its wires underground in Dallas, Texas.

# TELEPHONE INCORPORATIONS.

The Williamstown and Owenton Telephone Company, Williamstown, Ky. Capital stock, \$25,000.

The Magoupin Telephone & Telegraph Company, Carlinville, Ill. Capital stock, \$10,000. Incorporators: James A. Fletcher, C. G. Heinze and Robert Whitely, Jr.

The International Interior Telephone Company of West Virginia, Baltimore, Md. Capital stock \$50,000. Incorporators: T. F. Wilcox, C. H. Hook, G. F. Jones, C. C. Hughes, D. S. Pindel, all of Baltimore, Md.

The Plainfield Telephone Company—to construct and operate an independent telephone system in Union, Somerset and Middlesex counties, N. J. Capital stock, \$15,000. Incorporators: Andrew Dingler and Robert J. Emery, Jersey City, and Henry J. Atkinson, of Red Bank.

# NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic,  $16\S@16\Sc.$ ; Lake,  $16\S@17c.$ ; casting,  $16\S@16\Sc.$ 

Traffic of the Metropolitan Elevated (Chicago) for two weeks in May has increased 18 per cent. Operating expenses are under 40 per cent. of gross earnings.

The production and exports of copper for the month of April shows a total output by domestic mines of a little over 24,000 gross tons, and by foreign mines of over 7,300 gross tons.

The Consolidated Electric Company of Philadelphia has secured control of the electric lighting plants in Oil City and Franklin, and is negotiating for the Smithman Street Railway of Oil City.

A special meeting of the stockholders of the Southwestern Telegraph and Telephone Company will be held in New York City on June 12 to vote on a proposed increase of capital stock from \$7,000,000 to \$10,000,000.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 20@23; New York Electric Vehicle Transportation, 8@9, New England Transportation, 4@5; Gramophone, 4(@50.

A mortgage sale of the plant, franchise, etc., of the Kalamazoo Heat, Light, & Power Company of Kalamazoo, Mich., was made to Chicago parties recently for \$38,000. This ends a long drawn out litigation for the possession of the plant.

The Bath Gas and Electric Company of Bath, Me., which has been in the hands of assigness since August 30, 1898, has been sold to George F. West of Portland, Me., for \$14.500. There are \$125,000 of first mortgage bonds out, and \$90,000 of second mortgage bonds.

The Amsterdam (N. Y.) and Hagaman Traction Company has been organized. This company proposes to distribute the electric power generated by the Empire State Power Company at Amsterdam. It will also operate street railways. The capital stock is \$100,000, divided into 1,000 shares.

The issue of North Chicago Street Ruilroad 6 percent, certificates of indebtedness to the amount of \$298,000 issued January 1, 1891, but subject to call at par, have been called for payment. Interest will cease July 1 next. This makes \$413,000 North and West Chicago debentures retired since the Union Traction Company secured control of these properties.

The Susquehanna Traction Company, which was organized at Lock Haven, Pa., on May 8, will take charge of the Lock Haven trolley line, which was recently sold at receiver's sale for \$34,700. The capital stock of the new company will be \$200,000. There will be a bond issue of \$100,000 of which \$75,000 will be expended in cancellation of old debts for repairs.

Some changes have been made in the management of the North Jersey Street

Some changes have been made in the management of the North Jersey Street Railway Company, which has its headquarters in Jersey City. Vice-President and General Manager David Young has appointed Harry W. Fuller assistant general manager. This was done by authority of the Executive Committe of the Board of Directors with a view of relieving Mr. Young of some of his arduous duties.

Stockholders of the Consolidated Traction Company of Pittsburg will vote June 20 upon a modified proposition to lease the road to the new Union Traction Company. The preferred dividend rental is limited to 6 per cent. under the new terms, and it was the higher return proposed originally that caused objection from common shareholders. Preferred and common stockholders may subscribe to 40 per cent. of stock of the new company.

The annual meeting of the stockholders of the Anaconda Copper Mining Com-

The annual meeting of the stockholders of the Anaconda Copper Mining Company was held in Anaconda last week. Nearly all the stock was represented by proxy. The only matter that came before the meeting was the election of a board of trustees. It is comprised as follows: Marcus Daly, H. H. Bogers, Wm. Rockefeller, Albert C. Burrage, Wm. J. Bull. Wm. G. Rockefeller, E. C. Bogert. The trustees will meet next month in New York to elect officers.

trustees will meet next month in New York to elect officers.

At a meeting of the directors of the Kings County Electric Light and Power Company, held on the afternoon of May 16 at 54 Wall street, New York, a quarterly dividend of 1½ per cent. on the issued capital stock of the company out of the earnings for the past three months payable June 1 was ordered paid. Transfer books closed May 21 and reopen June 1. This dividend is at the rate of 6 per cent. per annum. At a meeting of the directors a week previous the reports presented of the business standing of the company showed that the earnings amounted to 12 per cent. of the capital stock, of which there is \$2,000,000 issued.

per cent. of the capital stock, of which there is \$2,000,000 issued.

The Citizens' Railway, Light & Power Company of Hampton Roads, Va., which was incorporated on May 1 with \$2 0,000 of capital stock as a consolidation of the Peninsula Railway Company, the Peninsula Electric Light & Power Company and the Chesapeake & Hampton Roads Railway Company, has made a mortgage to the Maryland Trust Company of Baltimore, as trustee, to secure \$800,000 bonds. The present issue of stock is \$200,000, as above stated, but this can be increased under the articles of incorporation to not exceeding \$500,000. The Newport News and Old Point Railway & Electric Company controls the Citizens' Company and it is understood will guarantee that company's bonds.

The Metropolitan stockholders at a meeting on the 17th inst. approved the

derstood will guarantee that company's bonds.

The Metropolitan stockholders at a meeting on the 17th inst. approved the Third Avenue lease as well as the proposition to issue \$7.000,000 additional capital stock. Over 339,000 shares of stock were represented. All the property, including franchises, of the Third Avenue Railroad Company was covered by a mortgage which was filed with Register Fromme on May 18 in favor of the Morton Trust Company, as trustee, for \$35.000,000 The mortgage is made to secure an issue of 5 per cent. gold bonds maturing in 1937. The stockholders and the Board of Directors of the Third Avenue Railroad Company, at meetings held on May 11, voted to sanction the issue of bonds, to cover which the mortgage was given to the Morton Trust Company.

We understand, "ays the Boston "News Bureau," that the terms under which 6,000 shares of the South Shore & Boston Street Bailway Company stock, out of 6,900 shares, were sold to the Massachusette Electric Companies, were one share of Massachusette Electric Companies preferred stock and three-fourths share of common for each share of stock of the South Shore & Boston road. This exchange of stock will not take place until August although the Massachusetts Company is already in control of the road. G. A. Fernald & Co., who effected the sale, has arranged to secure for the minority holders the same terms at which a sale of a majority of the stock was made. It is estimated that through this consolidation a saving of \$20,000 per year can be effected from the start, which would be equal to 3 per cent, on the outstanding stock of the Suth Shore road. 3 per cent. on the outstanding stock of the South Shore road.

A newspaper report from Boston says: The New England Electric Vehicle & Transportation Co. is still in a transition state. It has passed the experimental stage, but pending the delivery of an adequate number of vehicles the company is not in a position to show its true earning capacity. The company is making very handsome gress earnings per vehicle, but its operating expenses per vehicle are extraordinarily high, owing to the fact that it requires practically the same amount of station apparatus for fifty or sixly vehicles as for many times that number. Then again it is now obliged to do its charging and renewing of batteries by hand, whereast it is proposed to do all this by machinery at a great saving in expenses. It is not expected that the company will be in a position to give a good account of itself until autumn, for by that time it will have between 300 and 400 vehicles in commission, including 100 cabs, 100 delivery wagons and 100 open vehicles.

# EDITORIAL NOTES.

The Twenty-third Convention of the

The Twenty-third Convention of the National Electric Light Associa-National Electric tion, which has just Light Association. drawn to a close, was probably the most suc-

cessful yet held-at least such would seem to be the concensus of opinion. Most of the papers read and subjects touched upon were of a high order and are valuable additions to the literature already published on those subjects. The reports especially were more complete and contained more precise information than has generally speaking heretofore been the case, that on the "Photometric Values of Arc Lamps," deserving special mention.

An important step, and one that is to be commended, was also taken by the Association in indorsing the standardization of electrical apparatus adopted by the American Institute of Electrical Engineers. Lieut. Cahoon's paper on a "System of Uniform Accounting," and the discussion which followed also deserve special mention.

Excellent judgment was exercised in the selection of officers for the ensuing year, especially in Mr. J. B. Cahoon for president. Mr. Cahoon, as will be seen by a glance at his biography, which is to be found on page 326, has had a wide and extensive experience in the electrical field, and especially that pertaining to central station plants, which should redound to the benefit of the Association.

The attendance was everything that could be desired, there being about three hundred and fifty delegates and visitors present, not including some twenty ladies.

The proceedings in full will be found elsewhere in this issue.

Electricity Versus Steam for Ocean Liners.

Owing to the fact that electricity is extremely flexible and easily adapted to very many purposes a large number of persons

appear to labor under the delusion that it can be applied economically and efficaciously wherever power is needed. Such, however, is far from being the case, for as every one knows everything in this world has its limitations, and the electric current is no exception to this rule. Thus up to the present it has been found impossible to apply electricity to the propulsion of ocean-going steamers, owing to the excessive weight the necessary storage batteries would entail. Granted there are several small ships driven by electricity, the largest of these plying, if we are not mistaken, on the River Mersey, in England, which, however, is scarcely more than a good size tug boat, being but 75 feet in length. In view of this fact and the present state of the art, it is, to say the least, rather surprising to hear people talk of the early possibility of journeying from New York to Liverpool in an electrically-driven ocean liner. But this is just what is happening and that is inferred in an article which has been going the rounds of the daily papers during the past week. The article in question is amusing, principally on account of its inaccuracy. The author-whoever he is-compares the weight of an ordinary steam plant in an ocean liner of 10,000 horse power with an electrical plant of similar capacity, and either through an inexcusable oversight, or by a deliberate juggling of figures, makes it appear that the necessary electrical apparatus would weight but little more than the steam engines, boilers and coal. The article says:

"On the important question of relative weight, some approximate data are already available. Summing up the weight of engine, boiler and fuel on board and dividing the aggregate by the horse-power of the engine will give the weight of the material per horse-power for the transatlantic trip. Were this figure in any way comparable to the weight of battery and motor per horse-power, the question then to decide would be whether to carry power on tap ready for immediate use, at what would presumably be a higher figure, or carry coal, with engines, boiler, etc., according to the present practice. A rough estimate as to the weight of the steam plant on board an average ship would show that 6,000 tons of coal added to the weight of the engines and boilers would give in round figures an aggregate weight of 10,000 tons. A storage battery capable of giving 10,-000 horse-power for six days would weigh, on the basis of seventy-five pounds per horsepower an hour, 75 times 10,000 times 24 times 6, divided by 2,000 equal to 9,000 tons. Making an allowance of 2,000 to 3,000 tons for motors, with their appurtenances, a fair balance would be struck of 12,000 tons weight of electrical machinery, against 10,000 tons weight of steam appliances. Even if the cost of operating electrical machinery were no less than that involved in the use of steam, it would give many advantages, such as increased space, available for cargo or passengers, a simpler method of operating the ship and in all probability an ultimate gain to the owners through saving in power caused by poor stoking. So that while the electrical navigation of ocean steamships is not yet assured, from the attention it has recently received it would seem to be in a likely way to be the subject of early investigation in electrical circles."

Ten thousand tons for steam plant and fuel as compared to twelve thousand tons for storage batteries and appliances would really be very satisfactory, and would augur an early solution of this problem. Unfortunately, the author of the article in the figures given has figured on the weight of batteries for one day and not for six days. For with the figures given,  $75 \times 10,000 \times 24 \times 6 = 108,000,000$ , and divided by 2,000, to reduce to tons, gives 54,000 tons, and not 9,000 tons as the article has it. This rather changes the aspect of affairs, and impresses one with the fact that the weight of storage batteries will have to be materially reduced before it will be either necessary or advisable to relegate to the scrap heap the triple or quadruple expansion steam engines now in use on ocean greyhounds.

#### \* \* \*

The
Proposed
National
Standardizing
Bureau.

The Committee on Coinage, Weights and Measures, to whom the House of Representatives in Washington referred the bill to establish the national standardizing bureau, has given the sub-

ject careful consideration, and has strongly recommended the passage of the bill. The committee has pointed out the fact that the introduction of accurate scientific methods into manufacturing processes, necessitates the use of a far greater variety of accurate standards and standard measuring apparatus than was formerly required, and enormous commercial transactions are based daily upon the reading of measuring apparatus, inaccuracies of which involve great injustice, financial loss, and expensive litigation. At present a large proportion of the scientific apparatus used by our schools, colleges, universities and laboratories is imported, and our manufacturers of these instruments cannot compete with the manufacturers of other countries without the facilities of a suitable standardizing laboratory. The extensive scientific work carried on in the laboratories of the different departments of the Government requires the use of many standards and instruments of precision which cannot be procured or tested in this country, thus involving great loss of time, inconvenience, and lack of uniformity.

The great interests above mentioned are compelled at present to utilize the far superior standardizing facilities of other Governments, and the advantage to be gained in each case alone would warrant the establishment of the proposed institution. It is therefore the unanimous opinion of the committee that no more essential aid could be given to manufacturing, commerce, the makers of scientific apparatus, the scientific work of the Government, of schools, colleges and universities than by the establishment of the institution proposed in the pending bill.

Furthermore, it is eminently fitting and proper that at the close of a century remarkable for its scientific discoveries and the de-

velopment, we should show our appreciation of the labors of those careful, devoted seekers of the truth to whom we are indebted for the discovery of the fundamental laws and principles upon which our daily health, comfort and prosperity depend, and who, as teachers and investigators, have won for our country a place second to none in the scientific world, by the establishment of the proposed institution, which they have unanimously requested. It is believed that the expenses of maintaining this institution, if properly administered, will be largely repaid by fees resulting from its work.

In view of these facts the committee strongly urged the enactment of the pending bill.

It is interesting to note that the National Electric Light Association adopted a resolution in favor of the passage of the bill.

The Inter-State and West Indian Exposition.

From all indications there will be two expositions in this country in 1901 worthy of note, namely, that at Buffalo,

known as the Pan-American, and one in South Carolina, which will go under the name of the Inter-State and West Indian. The latter it is thought will fittingly illustrate the marvelous development and resources of the United States, particularly the Southern portion, during the nineteenth century, by a display of the arts, industries, manufactures, and products of the soil and sea. This proposed exposition will be held at Charleston, S. C., beginning December 1, 1901, and terminating May 1, 1902. The fact of its being held at no great distance from the islands of Cuba and Porto Rico should prove of benefit to the commercial interests. not only of this country, but of those islands as well. The exposition was originally projected to display the manufactures and industries of South Carolina, but so much interest was evinced in the affair by the citizens of other States, that it has been found necessary to enlarge its plan and scope, and it is now contemplated that every State and territory in the Union will have a place either among the collective exhibits or in the group of State buildings. Negotiations are being conducted with the Government for a large and comprehensive exhibit from Cuba and Porto Rico, and there will also be exhibits from many foreign countries. It is proposed to make a special feature of electrical appliances of all kinds. electric machinery and its adaptation to the various industries peculiar to the Southern States, while in the transportation section special attention will be given to the exhibit of automobiles.

The sequel of expositions in this and foreign countries has almost invariably been increased trade, immigration and prosperity, and in view of these facts the coming exposition will undoubtedly do much toward calling the attention of the world to the resources of the South. That electrical manufacturers will be well represented there is little doubt, as by so doing they will ultimately participate more fully in the large and growing trade of the Southern States

By direction of Gen. Wilson, chief of engineers, a board of engineer officers has been convened at the War Department at Washington for the purpose of considering and reporting a uniform system of electric plants at the various seacoast fortifications. These plants are used for the manipulation of ordnance ma-

chinery and for illuminating purposes. They are not all of the same character, and it is the province of the board to suggest the best general system for adoption at all the fortifications. The board consists of Major S. S. Leach, from New London, Conn., First Lieut. James B. Cavanaugh, from Mobile, Ala., and First Lieut. Robert R. Raymond, from Boston. These officers have all been closely indentified with the construction of fortifications for some time past, and are considered eminently qualified to pass upon the questions submitted to the board.

# UNDER THE SEARCHLIGHT.

# Notes and Comments on Various Topics.

THE Ohio Electric Association has decided to hold its next annual meeting at Put-in-Bay, and elected the following officers: President, Dr. J. K. Scudder, Cincinnati; first vice-president, Dr. T. D. Hollingsworth, Creston; second vice-president, D. Clotts, Gahanna; corresponding secretary, W. N. Mundy, Forest; recording secretary, W. S. Turner, Waynesfield; treasurer, R. C. Wintermute, Cincinnati.

Instruction in the operation of wireless telegraph instruments will be given the class of naval officers which is to be formed at Newport, R. I., during the coming summer.

THE first white lead mill to be driven entirely by electricity is at Port Richmond, N. Y. It has a capacity of 5,000 tons of white lead per annum, and is said to be a model of compactness and convenience.

St. Louis, Mo., is not the only place subject to street car strikes, for advices from Germany state that about 5,000 street car employes have gone on strike in Berlin, and are doing no little damage.

A CABLE dispatch from abroad states that Mr. Marconi, the wireless telegraphy expert, sailed last Saturday on the American liner St. Paul for New York. It is also stated that he is coming to the United States for the purpose of carrying out experiments in wireless telegraphy on a very much larger scale than has ever been done before. It is further interesting to note that on May 22 two more patents were taken out by Mr. Marconi in this country on wireless telegraphy apparatus, one of the claims of which reads as follows: "The combination of the primary and secondary of a sparking appliance, a battery in circuit with the primary, an aerial conductor led in close proximity to one terminal of the secondary, an earth connection connected to the other terminal, a receiver, two fixed contacts, one connected to one terminal of the primary, and the other to the receiver, a pivoted arm and two contacts on the arm insulated from each other and opposite the fixed contacts, one being connected to the other terminal of the primary and the other to the aerial conductor."

DURING a thunderstorm recently the main lighthouse at Sandy Hook, which is one of the oldest on the coast, having been built by the British, was struck by lightning and its electrical mechanism rendered useless. The bolt entered the north window of the lantern tower, striking the electric transformer, burning out fuses and wires, and then ran along a wire lead-

ing to the ground. In its passage it set fire to some oil stored at the foot of the tower, but the blaze was extinguished by the keeper and his assistants. The lantern has since been lighted with oil which will be used until the electric apparatus can be replaced.

The opening of the Northwestern Elevated Railroad in Chicago, which will take place tomorrow, is to be marked by elaborate ceremonies, and invitations have been sent to a numbe of people to attend the opening, and to ride n the first train. According to Mr. Yerkes' estimate, the road will, when it is in full operation, carry an average of 65,000 passengers a day.

THE first test of electric power in Chico, Cal., was made a short time ago when the current from the Butte County Electric Power and Lighting Company's power-house at Centreville, fourteen miles distant, was turned on at the Sperry Flour Company's new mill at Chico. The test proved satisfactory.

According to a statement from Milwaukee, Wis., the plant of the Hatch Electric Smelting Company, a \$2,000,000 corporation, is about completed. A recent trial test upon lead ore proved most satisfactory. The results showed that the electric furnace would effect a saving of fully 50 per cent. in the cost of reduction as compared with the regular fuel burning furnaces.

On Wednesday evening, September 26, the residents of Springfield, Ill., will witness a grand electrical parade. P. J. Toomey will again have charge of it. This year the torches formerly used to show off the effect of the floats will be abandoned and the illumination will be by incandescent lamps. The parade will be seen on the principal street car lines of the city and will consist of sixteen floats, each of which will be illuminated by 300 divers colored lights, or a total of 4,800 lamps for the entire parade.

News from Spain states that as evidence of general progress in Valencia the business of the General Tramway Company of that city, embracing some twenty-five miles of rails, has been taken over by a French company, which is substituting electric power for the steam and horse traction hitherto employed. Electric cars are already running between Valencia and the port, a distance of three miles. The system employed is the overhead cable and trolley. The new undertakings in all lines of electrical work throughout the peninsula offer exceptional opportunities for the sale of apparatus, machinery and kindred lines.

NEARLY all of the jute mills in India are now lighted with electric lights. It was found that the working people could work overtime under much better conditions with increased pay in the electric-lighted mill; the consequence was that the workmen flocked to the well-lighted mills, so that those mills which opposed the introduction of electric light were forced to provide it.

An experimental section of electric track on the banks of the Miami and Erie canal in Ohio has been tested and found successful. Several Detroit capitalists are associated in the enterprise. The company will be known as the Miami & Erie Transportation Company.

# National Electric Light Association.

Excellent Attendance at the Twenty-third Convention.

LIEUT, J. B. CAHOON ELECTED PRESIDENT.

Important Papers Read and Discussed—The Standardization Scheme Endorsed - Reports of the Various Committees - Sketch and Portrait of the New President.

Most of the delegates from the East to the National Electric Light Association Convention in Chicago arrived in that city on Monday afternoon, May 21, in ample time to attend the reception held in the evening in the parlors of the Auditorium Hotel. Those from the West and South were less fortunate, many not arriving until Tuesday morning, and in some instances not until Tuesday noon.

As usual, there was delay in getting the members together for the opening session, and although the meeting was scheduled for 10 o'clock, it was fully an hour later before President Carnes could induce the members to take their seats. A summary of the proceedings follows:

TUESDAY MAY 22 - MORNING SESSION.

President S. T. Carnes called the meeting to order at 11 o'clock and delivered the following address:

## THE PRESIDENT'S ADDRESS.

Fellow members of the National Electric Light Association and gentlemen: In opening the session of the Twenty-third Convention, I congratulate you upon meeting again for the fourth time in the great city of Chicago, for aside from the natural advantages of these regular meetings for the discussion of the various practical questions that most deeply interest us and for the further advantage of absorbing the ideas and practices of the most advanced and scientific workers in this most wonderful branch of modern science, we have here in this great city these most advanced workings and up-to-date practices practicably illustrated in a manner most satisfactory to the inquiring mind of the average central station manager, who in the majority of cases perhaps holds his position not for his original knowledge of the science, but for his ability to utilize this knowledge so absorbed for the benefit of his stockholders whose investments are made solely with the view of returns.

I am sensible of the contrast between this session and your previous ones, and especially the 21st and 22d just preceding, when we were presided over by gentlemen of marked ability and scientific attainments and whose opinions carried all that weight and value to which their own eminent success entitled them, while your present presiding officer represents that class of smaller central station managers who while something of a veteran in the business management is yet a neophyte in the science.

I appreciate to the fullest the compliment of being placed at the head of this organization, notwithstanding I accepted it as one to my section of the country, the South, and not to myself individually, for I am fully cognizant of my inability to reflect any credit upon the organization which has already obtained such a

high standard. My case is not so exaggerated, perhaps, but reminds me of the story of the country boy whose father took him to the city for the first time. He explained to this boy that there was a great difference between the manners and customs of the metropolis and those in the rural districts, and while there he must see and hear all that passed; he must refrain from talking or engaging in conversation for fear it might be discovered that he was a green country fool. The boy fully impressed with this advice resolved to follow it implicitly. A good natured city gentleman observing the verdant hue of this somewhat remarkable looking young provincial was curious to know something of his origin and history and undertook to engage him in conversation. He applied a number of qestions, and while the boy looked rather intelligently at him, he made no answer, Then the man asked him "Are you deaf and dumb?" The boy shook his head but answered not a word. "Then you must be a fool," said the man. "There now, dad," cried the boy, "they have found me out already and I never opened my mouth."

Your indiscreet indulgence in this compliment at the expense of your better judgment constrains me to confess that I became sufficiently inoculated with that same unaccountable nerve to seriously entertain the idea of making an effort to deprive you of the advantages of meeting in Chicago, by calling this session in my own native city of Memphis with naught to recommend it but its natural Southern hospitality: warm as its summer sun, genuine as its native corn juice, and as refreshing as its world renowned mint, the combination of which has the happy tendency to produce an absolutely irresistible power factor in the establishment of fraternal affection and brotherly love. A more mature reflection, however, convinced me that I would have to deprive myself of the pleasure of showing you the liveliest city in the South by consulting your better interests and coming to Chicago as originally intended. In this I am sure we have lost nothing, for I find that the wide-awake, up-to-date, progressive, whole-souled, all-around good fellows of the electrical fraternity here have with their usual enterprise and accustomed hospitality made every provision for our entertainment and pleasure; and when the programme is announced I predict that the power factor of good fellowship will be so fully established with the same high efficiency which has always characterized this famous city, that we will be unanimous in offering the least possible resistance.

Believing that the papers which have been prepared by several gentlemen, in response to urgent request, will cover subjects of most interest to the greatest number present at this time, I refrain from offering any further recommendations than a careful consideration and a free discussion of them.

I now declare this Convention formally opened.

# PAPERS, REPORTS, ETC.

Letters of regret at being unable to attend the Convention from Elihu Thomson, Nikola Tesla, Prof. Edward L. Nichols and others were then read by the Secretary, after which Mr. Henry L. Doherty read a report on "Photometric Value of Arc Lamps." This was followed by a lengthy discussion in which Messrs. Bean, Scovil, Carnes, Wagner, White and others took part.

The President then announced that the final

business of the morning session was the report of the Committee of Grounded Circuits, but as the chairman of the Committee, Capt. William Brophy, was not present, the reading of the report was deferred. The meeting then adjourned.

#### AFTERNOON SESSION.

The President called the meeting to order at 2:45 o'clock and announced that the first paper for the afternoon session would be on "Exhaust Steam Heating," by Henry J. Frith of Watseka, Ill., and F. A. Copeland of La Crosse, Wis. This paper proved exceedingly interesting and was followed by an instructive discussion.

A paper was then read on "Central Station Economies," by Mr. W. L. Abbott of Chicago. In the discussion which followed Prof. Goldsborough among other things said: "There were one or two points which Mr. Abbott brought out that appeal to me very strongly, and I should like to take this opportunity to emphasize them. I presume a man engaged in educational work has an opportunity to study the attitude of young men towards their work probably quite as much if not more than men in commercial life; and I think the point which Mr. Abbott made in regard to encouraging young men by holding out to them some prospect of advancement is an important one. I believe you could almost double the efficiency of any young man in your employ by having him feel that he has an interest in the business, an interest which will give to him in years to come a better position. I think that is beyond dispute, and any man who ever tried that method of handling young men will bear me out in what I say. It is more and more emphasized in my mind every year, as I have greater and greater opportunity of observing the success of young men who graduate from universities. There is another quite important point to which Mr. Abbott called attention, the matter of adjusting the number of boilers in a station to the work which the boilers have to perform. I have frequently noticed one of the prime defects in station management has come from this fact of heating up water and boiler iron without getting any return for the coal so expended, and in some cases it has been demonstrated beyond a doubt that several thousand dollars could be saved each year by simply giving attention to this one matter of adjusting the boiler capacity to the load upon the station.'

Others who took part in the discussion were Messrs. Doherty, Jackson, Cahoon and Bement. Mr. Doherty moved that a committee be appointed to determine the best method of analyzing fuel gas. The motion was seconded and carried and the President said: I will appoint that committee later after consulting with some of these gentlemen. We will now have the report of the committee on "Standardization of Electrical Apparatus." Prof. Robb read the report as follows:

# STANDARDIZATION OF ELECTRICAL APPARATUS.

At the preceding Convention of the Association held in New York in May, 1899, Mr. Paul Spencer of Newark, N. Y., Chairman of the Committee on Standard Specifications for Electrical Apparatus, presented a report. This report approved of the work then being carried on by a Committee of the American Institute of Electrical Engineers in standardizing apparatus, and recommended that it should be the basis of any similar action on the part of this Association so far as technical matters are con-

cerned. Since that time a final report has been accepted and published by the Institute, the classification and the rating of the various kinds of electrical apparatus being defined in considerable detail. This report was very well received and has already been formally approved by most of our prominent manufacturing companies and engineers. Although only published a few months, its recommendations are now commonly recognized and followed. It is generally conceded, even by its critics, that the report is impartial as well as substantially correct, and that its general adoption will be a great benefit to the many interests affected by it.

Your committee believes that the approval of that report by the National Electric Light Association would be a powerful influence in securing its universal acceptance, and recommends that such action be taken.

The same committee of the Institute is now working, in co-operation with a committee of the American Society of Mechanical Engineers, to secure a standardization of the sizes, speeds, and armature bore of direct-connected engines and dynamos, thus avoiding the confusion which now exists regarding these matters. Considerable progress has already been made, and it is hoped that these committees will be able to secure the much desired uniformity. This is in line with the report already made and will probably commend itself to the Association as being worthy of approval.

Regarding the advisability of preparing standard specifications, a matter that has been discussed before the Association several times, there are differences of opinion, and it is well to have the technical questions settled before taking up the commercial ones, but it would appear that the former will be formulated and accepted in the near future, so that the time would be ripe for at least considering the latter. It is wise to go rather slowly in these directions, but it is satisfactory to know that steady advance is being made.

F. B. CROCKER, W. L. ROBB, CALVIN W. RICE.

Mr. Cahoon, Syracuse—Mr. President, I have gone over these specifications and standards made by the American Institute of Electrical Engineers, and it seems to me that they ought to have the approval of this Association. They have been adopted by the American Institute of Electrical Engineers, and I think we are perfectly safe in following in their footsteps. They are coming into general use by engineers in drawing up their specifications, and I know from my own experience they help to simplify matters; and I therefore move that we approve of this standardization and adopt it.

The motion was carried. The meeting then adjourned until Wednesday morning.

Wednesday—Morning Session.

President Carnes called the meeting to order at 10:30 o'clock.

The reading and discussion of the paper on "Uniform Accounting," by Lieut. James Blake Cahoon of Syracuse, N. Y., occupied the entire session. The discussion was exhaustive and participated in by Messrs. Doherty, Bean, Insull, Neal, Weeks, Smith, Davies, Scovil, Anthony and Walbank.

On motion of Mr. Scovil the following resolution was passed:

Resolved, That it is the sense of this Association that the President and Executive Committee of this Association shall appoint a committee to formulate a system of uni-

form accounting, and that this committee proceed with its work as promptly as possible so as to put the system of accounting to be recommended by the committee in printed form in the hands of the members of the Association so the report can be discussed intelligently at the next annual meeting of the Association.

The meeting then adjourned until 2:30 o'clock.

WEDNESDAY - AFTERNOON SESSION.

The President called the meeting to order at 2:30, and stated that Prof. Robb's paper would be taken up.

Prof. Robb—The title of the paper is somewhat different from that announced on the programme. It is "Series Enclosed Alternating Arc Light for Street Lighting Service." The paper was then read, and was followed by a lengthy discussion in which Messrs. Wait, Turner, Smith, Neal, Hine, Hillman and others participated.

The President then appointed Mr. Samuel Insull, Chicago: Chas. R. Huntley, Buffalo, and E. R. Weeks, Kansas City, as the Committee on Nominations.

The following resolution was adopted:

The National Electric Light Association, representing in the capacity of its membership three hundred million dollars invested in the development of electrical industries, in annual convention assembled, have

Resolved, That the National Electric Light Association, feeling the great interest in the establishment of a laboratory which would be able to impartially furnish authoritative standards, earnestly recommends the passage by Congress of the bill providing for the establishment of a National Standardization Bureau.

Mr. Henry L. Doherty, St. Paul, Minn., then read a paper on "Equitable, Uniform and Competitive Rates."

Messrs. Ferguson, Gilchrist and Anthony, discussed the paper.

The meeting then adjourned until Thursday morning.

THURSDAY — MORNING SESSION.

President Carnes called the meeting to order at 10:15 o'clock.

The first business presented to the Convention was the report of the Committee on the Standard Candle Power of Incandescent Lamps. The Secretary read the report, prepared by Dr. Louis Bell and Mr. James I. Ayer, which, among other things said:

"With respect to sources of standards, your committee desires to call earnest attention to a measure now pending before Congress for the establishment of a National Standardizing Bureau, corresponding in its functions to the German Reichanstalt, which would be able to furnish authoritative standards to all who should desire them, and your committee respectfully recommends that the National Electric Light Association as a body indorse the establishment of such a standardizing bureau, and communicate its indorsement to Hon. James H. Southard, chairman of the House Committee on Coinage, Weights and Measures.

"Such a source for standards of light will be much more satisfactory and authoritative than anything which could otherwise be obtained, and its value to our Association and to the art in general can hardly be overestimated.

"Pending the establishment of such a Government institution, your committee is arranging to have standard 16 candle power lamps of 110 and 220 volts prepared at Columbia University, New York City, in pursuance of your com-

mittee's specifications. We believe that these will at least furnish a uniform and available standard of excellent quality.

"These lamps will be furnished in pairs at the cost of preparation, to such members of the National Electric Light Association as may desire them, and orders may be placed with the Secretary of the Association for such standards, which will be put through as promptly as possible."

On motion the report was received and ordered to be printed in the minutes.

President Carnes—We will now have the report of the Committee on Grounded Circuits. Mr. E. H. Davis read the report of the committee, which concluded as follows:

"While your committee feel that the permanent 'grounding' of one side of the secondary circuit is not an absolute preventative of accidents to person and property, yet they firmly believe it is a step in the right direction, and if adopted will add greatly to the safety of the public, and reduce the hazards attending the transmission of electrical energy by what is known as the alternating or transformer system."

The report of the Committee on Freight Classification was next presented. It said:

"After numerous interviews and voluminous correspondence with the Central Traffic Association at New York we have succeeded in getting the same definite answers we got which were embodied in our report last year, namely, that the railroads did not see their way clear to harmonize the classification of electrical apparatus with that of other merchandise. They did not use these words, but they refused to take action, and the expression exactly covers the case.

"Your committee sees no possible hope for justice at the hands of the representatives of railroad companies by any application of ours. The Interstate Commerce Commission have expressed a willingness to listen to our statements, but have coupled with that expression the statement that they were powerless to do anything only to make a recommendation, that they had no power to act or to compel the railroads to take action.

"That a condition exists that is grossly unfair to the electrical interests is realized by every manufacturer.

"The only suggestion your committee has to offer is that the matter be taken up in the United States Courts, and they recommend the employment of suitable counsel to this end as being the only possible remedy to-day."

Mr. Bean, St. Joseph, Mich.—Mr. President, the suggestions in this report are very important, and I move that the recommendations contained in the report of the committee be referred to the incoming Executive Committee for action.

The motion was put and carried.

President Carnes—There is one more report to be presented—the report of the Committee on Standard Rules.

The report was read by the Secretary and was as follows:

"Your Committee on Standard Rules have continued the same line of policy during the past year as heretofore, viz., to discountenance any changes in the national code of rules not absolutely necessary; but with the march of improvement in the electrical field some changes therein and additions thereto have been found necessary since the issue of 1897.

"Many of the changes made were suggested by the chairman of your committee, and others

received his approval. The policy heretofore pursued by the insurance organizations of sweeping out of existence thousands of dollars worth of material that had been used previously with the sanction of insurance inspectors has been abandoned, and while new and better devices and material are substituted an opportunity is offered the manufacturer, dealer, contractor and station manager to sell and use the material and fixtures on their hands.

"The thickness of interior conduit, lined or unlined, has been established, and commercial gas pipe taken as the standard. 'Weatherproof' wire, so called, is tabooed for interior construction unless covered with a slow-burning material. A standard of thickness of insulation on wire, after a conference with the manufacturers, has been established. The much vexed question of the proper distance between fuse terminals has been determined, as well as the distance between fuse metals of opposite polarity. Switches are now being standardized as to the proper breaking distance between poles, etc.

"The rules have been changed so as to permit the running of two or more small motors in series multiple or multiple on constant potential circuits.

"Rubber insulation is not now insisted on for flexible cord pendants in dry places, but an elastic slow-burning material may be used.

"Rule 40 has been so amended as to permit in dry places the use of a slow-burning insulation similar to what has been known in the past as 'Underwriters.'

"In future, as in the past, the interests of the Association in the matter of changes in or additions to the rules for safe wiring will be diligently looked after."

President Carnes—We will now have the paper of Mr. Elmer A. Sperry, of Cleveland, on "Automobiles as a Source of Revenue to Central Stations."

Mr. George Francis Sever, of Columbia College, New York, who read the paper for Mr. Sperry, said: Mr. Sperry has not been able to come here to present this report and he has asked me to read it for him, this being the result of some tests and results of operation which he has found with the new storage battery he has invented as applied to automobiles.

On motion of Mr. Bean the report was received with the thanks of the meeting and spread upon the minutes.

President Carnes—If there is no discussion on this paper, Mr. R. S. Felcht, of Pittsburg, will read his paper on "Combination of Electric Lighting, Power and Railway Work."

Mr. Feicht presented the paper, and on motion of Mr. Bean it was received with thanks and spread upon the minutes of the meeting.

President Carnes—We have some rather important business to transact in executive session and will adjourn this meeting to go into executive session.

The meeting then adjourned to executive session.

THURSDAY-AFTERNOON SESSION.

President Carnes called the meeting to order at 2:30 o'clock.

Mr. Samuel Insull presented the report of the Committee on Legislative Policy, which brought forth considerable discussion.

The report of the Nominating Committee was then presented as follows:

For President-James Blake Cahoon, Syracuse, N. Y.

First Vice-President—Louis A. Ferguson, Chicago, Ill.

Second Vice-President—W. Worth Bean, St. Joseph, Mich.

Members of the Executive Committee, to serve until the close of the Twenty-sixth Convention—Charles B. Hunt, London, Ont.; Ernest H. Davis, Williamsport, Pa.; Henry L. Doherty, St. Paul, Minn.

On motion of Mr. Scovil, the Secretary was authorized to cast the ballot of the Association for the members nominated.

The Secretary cast the ballot and President Carnes pronounced the gentlemen duly elected.

President Carnes—I will ask Mr. Insull and Mr. Huntley to escort the newly-elected President to the chair (Mr. Cahoon escorted to the platform). Gentlemen: I have great pleasure in introducing to you your new president, Mr. J. B. Cahoon, whom I am sure will reflect great credit upon the Association during the ensuing year. (Applause.)

Mr. Cahoon-Gentlemen: I suppose when a newly-elected President takes the chair he is expected to make a speech. I only want to say one or two words with reference to the work which has come up in this Convention. I think this Convention has been one of the most promising, and one that is to be most fruitful in results of any Convention I have ever attended. The work outlined for the coming year is such that I do not believe the President of the Association is going to have quite as easy a time of it as he has had in the past. We have taken up the subjects of accounting and of meter rates, and these two matters it seems to me should be pressed forward to completion. The question of cost is an important one. In view of what Mr. Huntley said, which I think is borne out by many of the companies in other sections of the country, that is, that only 231 per cent. of the electric light companies in New York State are paying dividends, the question of the determination of the cost of our product certainly deserves more consideration than it has been given in the past. Another point that seems to be forging rapidly to the front is the question of municipal ownership. In December of this year the American League of Municipalities meets in Charleston, S. C., and in the meantime we have to formulate some plan whereby we can secure what we went after last year, namely, the co-operation of the League in the determination of costs of municipally operated plants. That seems to be in general an outline of the work that is to be taken up. I want to say a word in regard to the use of the offices of the Association in New York. Last year I suggested that when the smaller plants were making changes in their systems, as many of them are doing, that they send to the Secretary of the Association a plan of their changes. Many of the small plants cannot afford to employ electrical engineers to design their work for them, but they do need the assistance of the Association in such matters as these. I am in hopes that this suggestion will be taken to heart. Gentlemen, I thank you very much for the honor you have conferred upon me in electing me as your President. (Applause.)

Brief remarks in acknowledgment of their election were made by Messrs. Ferguson, Bean, Davis and Doherty.

The report of the Secretary and Treasurer was read, showing the following financial transactions during the year:

Balance on hand, including special

President Carnes—I wish in retiring from the presidency to express my high gratitude for the high compliment you paid me in my election, and especially for your patient indulgence with my shortcomings and lack of ability to serve you as our former Presidents have done. While I have done the best I could, I realize fully how little that has been, and I am very grateful to you for your kind indulgence. (Applause.)

The meeting then adjourned.

# JAMES BLAKE CAHOON.

Lieut. James Blake Cahoon, the newly-elected President of the National Electric Light Association, was graduated from the United

ager of the expert department. He retained this connection with the company for five years, and at the same time was also made successively engineer-in-charge at the Lynn (Mass.) works and of the railway, marine and special-production departments, effecting the reorganization of these departments and placing them on a working basis. Subsequently he became engineer for the local companies' committee, having engineering charge of the local lighting companies in which the General Electric Company (into which the Thomson-Houston Company had in the meantime been merged) held a controlling interest.

Lieut. Cahoon left the General Electric Company in May, 1895, to become general manager of the electric light, gas, water and street railway companies in Elmira, N. Y. These properties had recently come under the control of the Mutual Life Insurance Company, and

JAMES BLAKE CAHOON, President of the National Electric Light Association.

States Naval Academy at Annapolis in 1879. and is thus one of the considerable number of former navy officers who have achieved prominence in the electrical field. He served on the U.S. S. Vandalia on the North Atlantic station until 1881 and was afterward transferred to the U S. S. Brooklyn, on the South Atlantic station, where he served until 1884, taking part in the Transit-of-Venus expedition in Patagonia in 1882. He received further technical training in the United States Torpedo School, from which he graduated in 1885. He was one of five selected to take a post-graduate course at that school in electricity. During this time Lieut. Cahoon suffered such a serious injury to the sight of his right eye, while conducting searchlight experiments, that he was ultimately; in 1889, impelled to retire from the

In the latter part of the year last mentioned Lieut. Cahoon became connected with the Thomson-Houston Electric Company as manwere greatly in need of a thorough overhauling and reconstruction to bring them up to a proper paying basis. An onerous task was thus put upon Lieut. Cahoon's shoulders, and, although progress was necessarily slow, the work was finally accomplished in the face of many obstacles.

More recently Lieut. Cahoon has taken up engineering work while still retaining an interest in central station properties. He was selected to design and build a 4,000-horse-power plant at Syracuse. However, this plan was given up upon the purchase of the existing electric light company's property by the syndicate with which the subject of this sketch was connected. Mr. Cahoon is now located in Syracuse as a consulting engineer and is also vice-president of the Oneida Light and Power Company. In addition, he is taking up the management of lighting properties. He is a veteran of the Spanish-American war and is a member of the Military Order of Foreign Wars, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers.

UTILIZATION OF EXHAUST STEAM FOR HEATING.\*

#### BY HARRY J. FRITH, Watseka, Ill.

The net earning of an electric light or power plant is represented by the gross income less the operating expenses and fixed charges. In all cases it is desirable the greatest return or net earning be produced on the money invested in the enterprise. To accomplish this result, each expense item must be reduced to a minimum and all productive factors, men, machinery, and equipment, worked to the fullest capacity.

Unfortunately, the electric load runs up to a peak of short duration, and machinery of ample capacity must be provided to carry the peak load, requiring investment oftentimes out of proportion to the average load. Boilers, in particular, prove inefficient on account of the short duration of their operating period. Could the boiler load be continuous, the efficiency would be greatly increased, and any plan that will produce a more uniform boiler load is a step in the right direction.

While the hours of the station employes are usually a little long, the actual labor performed is light, and if a uniform load were available (say, nearly equal to the peak), it could be cared for without additional labor expense. This is impossible; then, as nearly as practicable, each man and each piece of apparatus should fulfill those conditions which (provided the returns are sufficient) increase the net earning, accomplishing a much desired result.

As ways and means to this end, I shall take up the production of current and resulting by-products. The primary operation is the production of steam by burning coal in the furnace, which gives steam, and waste in the form of flue gases, radiation of heat from the furnace, etc. Ashes are left as a by-product of more or less value, as in most places a ready market for them exists. Aside from this insignificent saving, there is in the steam generator no particular by-product that can be utilized, except in large plants, where the flue gases may be put through fuel economizers and part of the heat in them be saved.

The efficiency of a tubular boiler under test conditions is probably very nearly seventy-five per cent. However, under ordinary conditions, as found in the smaller class of plants, sixty five to seventy per cent. probably more nearly represents the results obtained. Clearly, there is little or no chance of bettering this part of our station unless means are found whereby the boilers may be kept under a more even load.

The next operation is the use by the engines of the steam generated in the boilers, whereby some eight or ten per cent. is utilized; that is, ten per cent. of the available heat is converted into work. This, I believe, is a maximum figure for plants using simple engines run noncondensing. The engines deliver some ten per cent, of the heat of the steam in the form of power, and waste the remaining ninety per cent, in the form of exhaust. Of this exhaust, which may be considered a by-product, something can be saved in heating feed water, so it is safe to say that fully eighty per cent of the heat delivered by the boiler is, while a valuable by-product, thrown away and wasted, and represents a large portion of the operating expenses. Not only is the heat thrown away, but nearly all of the water evaporated is also thrown

\*Paper read at the Twenty-third Convention of the National Electric Light Association, Chicago, Ill., May 22, 1900.

away. If this water were saved, it would not have to be replaced with fresh water, and much trouble with dirty boilers would be avoided.

The other losses in transmission and conversion into electrical energy are well known, and are small. The heat in the exhaust represents the largest loss of a by-product, and I shall consider means for saving it and converting it into a profit. Can this be saved and made to yield a profit? I believe it can by using the exhaust steam for heating purposes. However, we should have an ideal system. The saving and sale of this heat, and the saving of the water of condensation require careful consideration, and I shall try to take the matter up in its various phases.

The temperature of exhaust steam, without back pressure, is 212 degrees Fahrenheit, making it applicable only for heating buildings. To use this for heating purposes from an exhaust heating central station, it is necessary to have a proper distribution of the heat to the points of consumption; and in distributing heat from a central station to distant points, one is confronted by a problem of no mean proportions.

First—The heat must be conducted through pipes, which must be well insulated to prevent radiation and loss.

Second—The heat must be moved rapidly.

Third—The heat in the exhaust steam must be used without placing any back pressure against the engine, for back pressure is a serious detriment to the efficiency of a steam plant. The ordinary engine working under economical conditions with a steam pressure at the throttle of 85 shows a M.E.P. of thirty-five to forty pounds if there be no back pressure except that required to overcome friction of the exhaust steam in its passage through the exhaust parts to the atmosphere. Back pressure detracts from the load-carrying capacity of the engine. Even five pounds back pressure means one-seventh of the power of the engine thrown away. To be sure, this may be offset by increasing the boiler pressure by some ten pounds; but this is not an economical operation and in many cases it is impossible.

Fourth—The system for furnishing this heat must be able to supply any class of consumers.

A system in which the radiators are always at or above a certain fixed temperature, regardless of the demand, is similiar to burning lamps all day to have light for the night. It is very evident that in an ideal system the regulation of the degree of the heat circulated must be under absolute control, so that a suitable heat may be furnished on a mild spring or fall day as well as during a winter blizzard and all intermediate weather. In a steam system the radiating surface is always at least 212 degrees. A necessary feature in successful heating is lost, for either all of the heat or else none is available; and on mild days, with the heat all on, the windows must be opened to reduce the temperature, and with the heat all off it is too chilly for comfort. The heating period has very few blizzard days annually—perhaps a dozen-about thirty days of zero weather, and the rest is weather wherein the temperature ranges from seventy degrees down to zero. This puts the system at maximum capacity for a dozen days, medium capacity for about thirty days, and under a light load for the greater portion of the time; the last condition prevails for fully three-fourths of the season. Clearly, regulation and ability to furnish mild heat are very important features, and in an ideal system. the degree of heat must be under absolute control. In other words, there must be distributed just enough heat at the right time and place, and a system in which the degree of heat cannot be varied at will must of necessity be wasteful during the period of light load.

Fifth—It is necessary to convey this heat from the central station to the various points of consumption in an efficient manner. For the accomplishment of this it is essential that there be minimum losses of heat by radiation in the mains underground, which requires a rapid movement of the heating medium; this operation must also be accomplished with a minimum expenditure of power. The circulating device must be reliable and inexpensive to maintain, otherwise there will be a loss of power and consequently of efficiency.

The entire system must be reasonable in first cost, in maintenance, and in operating expense; must be simple and reliable. There must be no weak points in it. It must be compact and occupy little space; must be neat in appearance and durable. All complicated parts and automatic devices must be avoided, as these are notoriously liable to get out of order and give more or less trouble, requiring expert attention. The system must be so constructed and installed that the depreciation account will be kept down to a minimum.

There must be provision to heat the boiler feed water, or, better still, the exhaust steam should be condensed, filtered to remove any oil, and returned to the boiler at a high temperature.

(To be continued.)

# CONDITIONS OF ELECTROLYTIC CORROSION IN BROOKLYN.

# BY SAMUEL SHELDON.

The borough of Brooklyn spreads over 60 square miles, and is covered with a network of surface trolley tracks. During the rush hours about 1,100 cars run upon these tracks and are supplied with current from seven power stations, supplying in all 47,000 amperes. Four of these are situated upon the East River water front and supply over 80 per cent. of the full load current. The currents return to the power-houses by the following paths:

First by the rails of this system, which are all bonded together, different lines employing different bonds. There are, for example, the cast weld bond, showing a conductivity of 100 per cent. or more of continuous rail; the Johnson electric weld bond, showing 85 per cent.; the R. P. Brown interfoliated bond giving 94 per cent., and the protected rail bond giving varying conductivities according to size of bond and rail

The second path of return results from the peculiar geographical position of the borough, and the singular conditions of the traffic. All of the car lines lead to the borough of Manhattan. During the rush hour at 6 P. M., nearly half of the cars in operation at the time are receiving current within a radius of one mile of the Brooklyn end of the Brooklyn Bridge. At this time a large proportion of the currents are returned by way of the East River.

The third path at present takes but a small part of the current, and consists in return feeders connected with the tracks at various points.

The fourth path, which it is the intention of the engineers of the Brooklyn Rapid Transit Company to utilize extensively along certain

lines, has become available as a result of the combination of the elevated railroad interests and the trolley railroad interests. It is, namely, the whole elevated structure. This is also used at present as a return circuit for the currents used in the operation of the few third rail trains which are now upon the elevated lines.

The fifth return path consists of the mains and the service pipes of the municipal water department, the mains and service pipes of the Brooklyn Union Gas Company, the cables of the New York and New Jersey Telephone Company, and the underground tubes of the Edison Electric Illuminating Company. These returning currents set up differences of potential between all underground conducting objects. The difference in potential between any two given points varies throughout the day, because of variations of the traffic conditions. In a similar manner it varies with the seasons. and is quite different on Sundays from what it is on week days. Furthermore, the potential differences are gradually growing smaller in the average, because of the better conductivity of the Transit Company's return circuit. They are also varying because of changes in the distribution of load among the power-houses.

The difference of potential between the rails and the hydrants and the rails and the gas mains varies from a fraction of a volt to 25 volts. Between the two ends of the Brooklyn Bridge there has been a difference of potential of 20 volts. Each power-house is surrounded by equipotential curves, and in the immediate vicinity of each the fall of potential is quite rapid.

The city may be divided up into districts, each power-house drawing current from a district. The boundaries of these districts hold the same position towards the returning currents of electricity as mountains do towards the water of a watershed. The difference of potential between a point on the boundary of a district and the ground in the immediate vicinity of the power-house supplying that district has been found to reach as high a value as 40 volts.

The municipal water mains pass through nearly all streets of the city and vary in size from 48 inches in diameter down. They are all made of cast-iron. Some are known as Scotch cast-iron pipes. These were made in Scotland and are of a peculiarly hard and tough cast-iron, which exhibits a very white surface on fracture, indicating a combination of the contained carbon. These pipes can always be recognized by ribs which occur at every two feet along the surface, and which are about four inches wide. These ribs consist of a thickening of the metal intended to furnish a firmer seating and more perfect joint for taps and branches.

Other mains that are of American manufacture are very much softer than the Scotch iron, but also exhibit a white surface on fracture. The employes of the water department prefer to work upon these mains because of the much less labor required to operate the cutting tools, owing to the relatively greater softness. In no case has an electrolytic corrosion of the water mains been discovered in the city, although many cases of corrosion of the service pipes have occurred.

The Brooklyn Union Gas Company has 7554 miles of gas mains. These are all made of white cast-iron. From them are led wrought iron service mains which are supplied with malleable iron and in some cases brass fittings. There are 272 miles of wrought iron service

<sup>\*</sup> Paper read at the 17th General Meeting of the American Institute of Electrical Engineers, Philadelphia, May 16, 1900.

pipes. These with their fittings have suffered corrosion in very many cases. Thirty-eight service pipes on one block were completely destroyed in three years. However, not until within a year has any corrosion of the mains been discovered, and then in but two cases. In each case the main was in an excessively dangerous district.

The gas company claims that there has been an abnormal increase of leakage since the introduction of electric traction in 1894. The leakages for various years are not accessible, but during 1899 it amounted to 13 per cent. of the total production of 4,500,000,000 cubic feet.

The New York and New Jersey Telephone Company has many miles of underground cables, the lead coverings of which have been pitted and perforated in many cases by electrolysis. The company, however, is fully aware of the possibilities of electrolytic corrosion, keeps itself informed of its cables and concerning the stray currents in their sheathings.

The Edison Illuminating Company has over 100 miles of underground tubing. These tubes have suffered considerably from electrolytic corrosion, doubtless resulting in many cases in the short-circuiting of the enclosed conductors.

Considering the magnitude of the system of the Brooklyn Rapid Transit Company and the time that it has been in operation (the first electric car was operated in 1894), considering the poorness of the ground return which existed on parts of the system up to within three or four years, it is surprising that no evidences of the corrosion of cast-iron have been discovered with the exception of the two cases mentioned above.

The apparent immunity of cast-iron was noticed by the Board of Commissioners of Electric Subways of the City of Brooklyn, and attention was called to the fact in several of their reports. These reports indicate that in their opinion the immunity was due to the peculiar chemical constitutions of the special kinds of cast-iron of which the mains were constructed. It hardly seems credible that such a form of iron could exist.

To experimentally test the matter, samples of Scotch and American pipes have been obtained from the water department as well as samples of the gas mains from the gas company. These have been used as anodes in various electrolytic cells. The electrolytes consisted of samples of earth from various parts of the city, moistened in some cases with distilled water, and in other cases by hydrant water or salt water. These cells were subjected to voltages of various magnitudes. In every case the anode was corroded, showing conclusively that there is no immunity because of chemical con-

In preparing some experiments to determine whether or not the apparent immunity of castiron mains was due to an electrolytic polarization E.M.F., due to absorbed gases in the pores of the rough exterior of the pipes and of sufficient magnitude to prevent the sending of any considerable current by the stray voltages, the true cause of immunity was discovered. In the casting of pipes in sand molds, the hot iron unites with a layer of the sand to form a silicious compound probably silicate of iron which forms a thin coating over the surface of the completed pipe. This coating is extremely thin, and is a non-conductor of electricity. It is not continuous, but contains perforations in many places. If a piece of pipe be covered with insulating paint, exposing only the rough sandpocked exterior surface, and if it be made an anode in an electrolytic solution, much less current will flow through the solution under a given impressed E.M.F. than under similar conditions with an anode exposing a filed surface of equal area. In some cases, no current at all will pass until the impressed voltage rises to a certain minimum value. If, however, a current be made to pass for a few moments under a moderately high impressed E.M.F., the rough sand-pocked surface becomes conducting throughout. The protecting film or skin seems to act like the non-conducting film thrown down in an aluminum cell. The existence of a perforated skin can also be shown by endeavoring to close a circuit, which contains a current indicating device, by means of a wire on the sand-pocked surface. The end of the wire may be rubbed around in many places before there is any indication of a closed circuit. Then, again, a spot will be found where the circuit is closed, and there is no indication of resistance of any magnitude at the point of contact

There is another thing which is perhaps equally as influential in preventing electrolytic corrosion, and that is the resistance offered by the soil. The various interested companies have observers in the field recording the potential differences between the rails and their underground system. Whenever the system is positive to the rail, the district is considered as dangerous, and corrosion is expected. It is well to notice that as corrosion will result at one side of any discontinuity of a metallic circuit, it may be expected to occur even in districts which are not considered dangerous. On the other hand, the amount of corrosion which will take place in a dangerous district under a given potential difference is dependent upon the smallness of the resistance offered by the soil. Now the measurement of the resistance of soil under laboratory conditions gives information which can hardly be applied with propriety to street conditions. It is much to be preferred that the resistance between the tracks and the other systems should be measured directly. While it is impossible to determine the resistance in such a manner as would enable one to calculate the current density at any point, and to ascertain the direction of flow lines, yet some idea of the magnitude of the ground resistance can be determined by the following method, which makes use of a low reading voltmeter (0 to 3 volts), and a battery having an E.M.F. of E volts. Let the resistance of the voltmeter be R ohms, then at any reading of the voltmeter  $\theta$ , the current which is traversing that voltmeter is  $\theta \div R$  amperes. Now to measure the resistance between two points, for example, a point on a rail and a point on a hydrant, take the following three readings: E', with the voltmeter alone connected between the two points; E with the battery alone connected to the voltmeter, and 0 with the battery and voltmeter connected in series between the two points. The effective resistance X between the two points is determined by considering that

whence 
$$\frac{E + E'}{B + X} = \frac{\theta}{R}$$

$$X = \frac{(E + E') R}{\theta} - R$$

$$= R \left( \frac{E + E'}{\theta} - 1 \right).$$

For ground voltages, which are less than one volt, two cells of ordinary dry battery are sufficient. The assumption in made that the small current sent by the battery in making the measurement does not produce an E.M F. of polarization of appreciable magnitude. This is unquestionably warranted when we consider the exposed area of the pipe or rail, and the smallness of the current. Measurements of effective resistance taken at a great many points between the hydrants of the water system and the rails in Brooklyn give values lying in the majority of cases between 10 and 35 ohms. The character of pavements seems to have no great influence on the resistance of the soil underneath. Measurements have been made in the case of asphalt, cobble stone, Belgian block, granite block, vitrified brick and dirt roads. In all cases there were variations in resistance with different conditions under the same pavements, but the average resistance was nearly the same in all cases.

It is very probable that the current which would flow through the resistance indicated by these measurements under a given difference of potential would be distributed over a large area of pipe surface, and therefore the current density under voltages of the magnitude of those which exist in Brooklyn, would require a long time to result in destructive corrosion.

These investigations have been carried out in collaboration with Mr. Charles V. Rapelje.

## THE USE OF ALUMINUM LINE WIRE AND SOME CONSTANTS FOR TRANS-**MISSION LINES.**\*

#### BY F. A. C. PERRINE AND F. G. BAUM.

Until the present time, discussions of the use of aluminum wire in line construction have been devoted to a consideration of the relative prices of copper and aluminum wires, the conductivity, tensile strength and other proportions of the aluminum wire being only considered as determining its relative price. During the past year the manufacturers of aluminum have demonstrated their ability to sell this wire at a price well below twice the price of copper per pound, and in consequence the new material has forced itself upon our notice and has demanded that we consider carefully all of its properties independent of any consideration of price. Having recently been forced into the purchase of a considerable amount of this wire by reason of the high price of copper and the low price of aluminum, the writers have made a careful study of the wire supplied, and now present the results obtained in hope that they may be of service to other engineers.

Some of these results have already been published,† but in these publications there have been so many misprints that it seems advisable to present the whole matter anew. The line for which this wire was purchased is about forty-three miles in length, and the country through which it runs varies in elevation from about one hundred feet above the sea level to at least two thousand feet; one-half lying in nearly a straight line through a country almost level, while the remainder is over the mountains, through which the line runs almost straight, surmounting high hills and descending into deep gulches. In some cases the length of the poles was proportioned to decrease the vertical line deflection, but as an

<sup>\*</sup>Abstract of paper read at the 17th General Meeting of the American Institute of Electrical Engineers, Philadelphia, May 16th, 1900.
†Tests and Calculations on a Forty Mile Aluminum Transmission Line. F. A. C. Perrine, Pacific Coast Transmission Association.

accurate preliminary survey was not available, much less grading of poles was possible than would have been desirable. This defect in pole setting was largely counteracted in the wire stringing by drawing of a number of spans at one time, so that at depressions and elevations there was a very little up or down strain put on the wire when it was tied to the insulators. The standard pole used was of square sawn redwood, thirty feet in length, seven inches square at the top, and tapering to twelve inches square at the butt or about 11 inches at the ground line five feet above the butt. Each pole was gained for three cross-arms 201 inches on centers, the gains being cut # inch deep, into which the cross-arms were bolted by single # inch through bolts. The arms themselves were 4x4 inch Oregon pine bored for two pins each, the top and bottom arms being three feet in length and the center arm four feet. The wires on this system of construction are arranged in a hexagon, each side being 24 inches

This system of construction presents some advantages for three phase working at high voltages for long lines, especially where the two sets of circuit are to be operated from the same bus bars. If both of the wires on each arm are at the same potential, the arrangement of each circuit is that of an equilateral triangle, each side being 41 inches, while the minimum distance for leakage between any two wires of different phases is 36 inches of cross-arm and 20 inches of pole, while the length of the longest arm necessary is much less than that in any other system of construction: the pole head is symmetrically loaded, and for these reasons the pole construction is exceptionally stable under all stresses.

The insulators used were a flat topped glass. triple petticoat type, about five inches in height and seven inches in diameter, with a wire groove of about .35 inches radius. The insulators are supported by eucalyptus pins of a length to give a distance of four inches between the bottom of the insulator petticoat and the cross-arm, eucalyptus wood having been used on account both of its availability in California for a special pin, and on account of its great strength, which is of extreme importance in the construction of pins of such length.\* For further insulation and preservation, the cross-arms used were creosoted by a treatment in which the timber was at first dried carefully and then injected with ten pounds of dead oil of coal tar to the cubic foot, an operation requiring approximately thirteen hours for its completion, while the pins were boiled at a temperature of about 225° F. for about eight hours in a compound of coal tar and asphaltum, a treatment which gave a better external surface than the creosote. This latter coating did not penetrate the wood materially, but after experimenting extensively with this wood at temperatures up to 225° F. and pressures up to 160 pounds per square inch without effecting any appreciable penetration of this wood, either with creosote or other extremely fluid materials, all idea of the use of a penetrating compound was abandoned. and an endeavor made to obtain a coating which would provide the most complete external protection.

On this line as erected, the arms were braced by a bent angle iron brace, but this precaution seems now to be entirely unnecessary, and a subsequent line, belonging to the Yuba Power Company, erected on much the same plan, is not braced at all. For arms of over five feet in length a brace is certainly advantageous, though it is the opinion of the writers that for high potential service the braces should be of wood mortised into the cross-arms and nailed to the pole face.

The above complete physical details of the construction are unnecessary for the discussion of aluminum line wire, though it is believed that its stability when erected depends upon a careful study of all such conditions.

The line as erected carried only four wires arranged on the top and bottom cross-arms, thus taking their location at the corners of a rectangle 24" on the short side and 41" on the long side. This arrangement was adopted for the purpose of making temporary use of some two-phase machinery which was in place and underloaded, allowing certain new customers to be taken on quite a year in advance of the contemplated completion of a three-phase plant for which the pole line was really designed.

It was at first feared that this arrangement of the wires would result in inductive disturbances between the phases, as the wires took their positions in the diagonally opposite corners of a rectangle, in place of the corners of a square, as is necessary for complete absence of mutual induction, but the anticipated trouble was not found. Careful measurements were made with one phase short circuited, and the other carrying about 20 amperes with a periodicity of 60 cycles per second, both with a Weston 75 volt voltmeter and a Rowland electrodynamometer, with the result that no deflection was observable on the voltmeter, while the current read on the electro-dynamometer amounted to only about .001 ampere, the resistance of the dynamometer being 25 ohms and of the line 90 ohms. Only one additional question of installation needs attention, which is the presence on the tops of the poles of a barbed wire stapled to the wood of the pole and grounded at every fourth pole by a galvanized iron wire leading down along the pole and soldered to an iron plate 18 inches square and inch thick, set in the pole hole immediately under the foot of the pole itself. This wire was intended as a lightning guard, and it has apparently done very effective service in discharging the line in all weather.

The wire used was intended to be equal to No. 3 B and S copper wire in its electrical resistance, and the manufacturers were required to furnish this conductivity in a wire not weighing more than 420 pounds per mile. All the wire supplied was carefully inspected by Mr. A. E. Kennelly, and his reports give the following averages for the total quantity:

Diameter	293.9 mils
Wt. per mile	419.4 lbs.
Resistance per mil foot	17.5 ohms at 25° C.
Resistance per mile at 25° C	1.00773 ohms
Conductivity compared with copper	59.9% by dimension
Tensile strength of wire	
No. of twists in 6 inches for fracture	17.9
Tensile strength per square inch	82898

Comparing this with copper it is seen that this wire is approximately the same as copper in the following sizes:

Size of aluminum wire = No. 1 B&S copper. " = No. 3 " " = No. 5 " " = No. 6 " Resistance of Tensile strength "
Weight of " Weight of

Therefore, on the basis of the same conductivity the aluminum compares with copper as follows:

The mechanical properties of this wire present some well marked characteristics. In the first place, the number of twists necessary for fracture varies considerably, although the ductility test of wrapping six times around its own diameter, unwrapping and wrapping again is well sustained. This irregularity in the twisting test is generally a mark of impurity in wire, but we know so little as yet of the exact characteristics of aluminum in particular, and the twisting test is in general so unreliable that it is unsafe to base any exact statement on this one test, particularly as the same after erection proved reliable. In carefully performing the test for tensile strength no exact point could be assigned for the elastic limit, as the metal seemed to take a permanent set almost from the first, but at a stress of from 14,500 pounds to 17,000 pounds per square inch, there is a marked increase in the permanent set which indicates that the safe working load lies somewhere in this region. In this the characteristics, of the aluminum do not differ materially from those of copper or other similar metals, and while this is a disadvantage it is not a singularity.

The fact that the wire will permanently elongate if seriously strained makes it necessary to use the utmost care in the erection of lines. and also the known high coefficient of expansion with temperature changes taken in conjunction with this property renders care in line stringing especially important and difficult.

Instructions to line foreman in stringing wires:

- 1. All spans are to be strung with deflections and tensions as specified.
- 2. Up and down hill spans to be sprung to correspond with level spans. In case level spans cannot be used, then employ dynamometer. and ease all wires over cross-arms.
- 3. All ties are to be made at one time by signal.
- 4. All ties are to be made crossing wires around insulator serving three times around wire, and twisting behind insulators; the ends of the tie-wires are not to be cut but bent back toward insulators.
- 5. Tie all wires on the outside of the insulators, except at corners where all are to be tied so that the strain is against the insulator.
- 6. Joints are to be made by means of sleeves twisted two and a half times, the ends of the wires being given one turn by hand around the wire. No tools being used, except in twisting the sleeves, and cutting off the ends of the wires. Before inserting the wire in the sleeve, the ends of the wire must be roughened by draw filing.
- 7. Barb wire is to be laid along the roof of the pole and held by three staples driven in tightly, but without kinking the wire. Ground wires are to be soldered to the barb wire, and at the bottom of the pole to the wire leading from the ground plate. All soldering acids must be carefully washed away after the soldering is done.
- 8. Beginning between poles one and two, all wires are to be barreled by shifting one pin, and same to be repeated between poles 21 and 22 and 41 and 42, and so on. Barreling always in the same direction of twist every twenty poles. A record must be kept of the location of every wire and every pole.

GENERAL CAUTION.

The greatest care must at all times be taken against kinking or scarring the wire; wherever the wire is accidentally kinked or scarred it must be cut and spliced.

<sup>\*\*</sup>Tests of a considerable number of pins made of eucalyptus, oak and locust show that the eucalyptus has about 20 per cent more strength than locust and 30 per cent more than oak.

The targets consisted of light sheet iron strips about two feet long and two inches wide, with an aluminum hoop bent into an eve at the top, by means of which they could be hung from the line wire. These targets were painted in three or four colors, with bands one inch wide. In use the captain of the linemen would hang his target on the wire to which a man on the next pole had also hung a target; then, as the wire was being pulled into place, he would sight from a band on his target to the same band on the adjacent target, and when the wire came into line with these two bands the signal would be given for all the linemen to tie at once. As a result of this method of stringing, an exceedingly uniform line, and one strong in accordance with the temperature was obtained.

One of the most serious problems in connection with the use of aluminum is in the choice of a proper joint. This metal is so highly electro-positive that it is unsafe to expose it to the elements in contact with any other material, as electrolytic corrosion is almost sure to follow such construction. Many of the failures which have been reported of this metal have been due to a neglect of this fact, as notably in the case of the plates on the yacht Defender, where the plates have been corroded at the contact with the bronze rivets used in fastening them to the frame. Whenever this metal is soldered or used in contact with any other metal, the joint should be thoroughly waterproofed to prevent such action. After discussing many joints, it was finally determined to abandon any attempt to solder or clamp the wire in any manner, and the joints were made by slipping the ends of the wire into an oval aluminum tube about nine inches long, which was then twisted with a pair of clamps similar to those employed in twisting the McIntire connector. After twisting the tube a turn was taken by hand of the loose ends, and the wire cut off close. The joint produced proved practically equal to the original wire in both tensile strength and electrical conductivity.

This wire was erected during the winter of 1898-99, which was an unusually open winter over the whole State of California, allowing practically continuous construction work, though the temperature varied all the way from about 30°F. to 80° F. at times when the wire was being strung. After it was finally erected it remained about three months on the poles before the machinery was delivered and put in place. During the first month of that time three breaks occured which were all apparently due to flaws in the material, but after these breaks were repaired the line wire gave absolutely no trouble whatever, though various accidents occurred to other parts of the construction. Many insulators were shot at and broken, bale wire and bale rope were thrown over the line, a twig short-circuited one phase and fell down burned, a large bird was killed by contact with the wires, and finally several porcelain insulators with porcelain pins were broken off and hung suspended by the wire. In January and February of the present year this whole line was taken down to give place to a much heavier one of the same material, an opportunity for an entire change having been found after the total destruction of the power house by fire last November.

During the past two years other lines of aluminum wire have been erected on the Pacific coast, all but one of which have given a considerable amount of trouble from causes that are not entirely apparent.

One line in Nevada County, erected at about the same time as that we have been describing, and for which the wire was of practically the same lot, has given no trouble whatever.

The power transmission lines of aluminum wire about Seattle have broken a few times, but have not given serious trouble. The breaks in this line, so far as the writers have been informed, seem to have been due to not allowing enough sag at the higher temperatures, and a consequent overstraining of the wire in cold weather

The most serious difficulties have been encountered by the telephone company in Washington and Oregon, and by the Yuba Power Company. In all of these cases it seemed almost impossible to keep the wires on the poles in certain sections, and in these portions the lines have been finally taken down and replaced by other wire of either copper or aluminum. The writers have examined many breaks from these lines, and would judge, from the appearance of the fracture, that the cause, whatever it may be, was similar. In those breaks there are many small flaws, but by far the greatest majority are clear, sharp fractures, with but a slight reduction of area, and that entirely on one side, a break very characteristic of improperly mixed and brittle alloys. Partially from the appearance of the fracture, and partially from the facts that the breaks occur only in certain sections of the line, the writers are of the opinion that this trouble is due to the presence of impurities in the material. This view is strengthened by the fact when measurements were made on the line of the Yuba Power Company, the resistance of the whole line was found to be 10 per cent. greater than it should have been if it were made of the quality of material described in the earlier part of this paper. Furthermore, in one-half of this line there were no breaks at all due to defects in the wire itself.

As a general conclusion, it is the opinion of the writers that aluminum can be safely used in place of copper where the proper precautions are taken in inspecting the wire before it is erected, and in erecting it with due consideration of its peculiar properties of low and indefinite elastic limit, high coefficient of temperature expansion and active electrolytic power.

Indicating our faith in this opinion, it may be noted that for the new line soon to be erected an aluminum strand ‡ inches in diameter has been ordered. This strand will be spliced with aluminum sleeves, and in the whole construction about one million pounds of aluminum will be employed.

# Proposals Invited.

The Treasury Department is inviting sealed proposals until June 12 for installing a system of electric light wiring in the United States Custom House at St. Louis, Mo. Plans and specifications may be obtained upon application to the Secretary of the Treasury, Washington, D. C.

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended May 26:

Amsterdam, 1 case \$15; Antwerp, 27 cases, \$4,384; Australia, 10 cases electric motors, \$823; Bologna, 5 packages, \$125; Bradford, 10 packages, \$1,188; Bristol 3 packages; \$350; British

East Indies, 1 case, \$41; British West Indies, 13 packages, \$404; Brussels, 59 packages, \$2,647; Central America, 1 case, \$10; Chili, 65 packages \$2,731; Cuba, 17 boxes, \$630; Darlington, 1 case, \$165; Garran, 6 cases, \$300; Genoa, 18 packages, \$6,505; Glasgow, 21 cases, \$1,012; Hamburg, 81 packages, \$10 204; Lisbon, 652 packages, \$8,703; Liverpool, 15 cases, \$638; London, 34 cases, \$1,-578; 240 packages, \$26,622; Madrid, 2 cases, \$74; Manchester, 6 cases, \$3,415; Mexico, 78 packages, \$2,886; Naples, 62 packages, \$17,118; New Zealand, 10 cases, \$159; Odessa, 7 packages, \$607; Peru, 511 packages, \$32,254; Porto Rico, 36 packages \$360; Riga, 6 cases, \$1,500; San Do mingo, 399 packages, \$4,187; Southampton, 20 cases, \$657, Stockholm, 1 case, \$110; U. S. Colombia, 6 cases, \$200; Venezuela, 13 packages, \$157.

#### LEGAL NOTES.

A case in equity recently came before Judge Lowell in the United States District Court of Boston, Mass., raising an issue in regard to patent rights on electrical machines which may prove of great moment. The suit is brought as a test case by the General Electric Company against the Webster & Dudley Street Railway Company, asking for an injuction preventing the latter named corporation from using dynamos as at present constructed, on the ground that the winding of the armature is in violation of a patent held by the General Electric Com-The patent in question is what is pany. known as the Eickemeyer patent. It is claimed the Eickemeyer patent covers the winding of a number of armatures now in general use in that the present winding was not used previous to the invention just mentioned. The Webster & Dudley Company contend that the winding used by them is that in general use on armaand that it was in use some time before the Eickemeyer patent was obtained.

# PERSONAL MENTION.

Mr. George B. Griffin, formerly general manager of the Elmira (N. Y.) Illuminating Company, is now agent for the Manhattan General Improvement Company, an electrical concern of Newark, N. J., and has his headquarters in Boston, Mass., having charge of the company's business in the New England States.

Mr. C. L. Harry, recently accepted the superintendency of the street railway and electric lighting systems at Jackson, Miss.

Lieut. John B. Blish, the Navy's principal electrical expert, who is now at Newport, R. I., establishing an experimental wireless telegraph station, has been ordered to proceed to Europe on the Lucania next Saturday to study submarine cable laying, with a view to utilizing his experience in the construction of a Government line to Hawaii, and eventually to Manila.

# INCORPORATIONS.

The B. & H. Electric Construction & Supply Company, Kittery, Me.—to deal in electrical and plumbing supplies. Capital stock. \$30,000. Incorporators: L. M. Cook, L. H. Murphy, J. Murphy. A. Brownell, all of Providence; F. E. Rowell, attorney, of Kittery.

The Carleton Electric Company, New York City—to do an engineering business. Capital stock. \$100,000. Incorporators: H. C. Carleton, C. E. Phelps. both of New York City; J. C. Osgood, of Denver, Col.; Harmon & Mathewson, attorneys, New York City.

# ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHRL, Bolicitor and Attorney for AMERICAN AND FORKIGN PATENTS, at 302 and 504 Broadway (Room 1204), New York City, also at 659 F street. N W., Washington. D C., who has been identified with this work before the U S Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks. Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304 Broadway, New York City. N. Y., or 659 F street, N. W., Washington, D. C. Côpies of any patent published can be furnished upon pay-

nt of ten cents. When ordering give name, date and title of invention wanted.

## LETTERS PATENT ISSUED MAY 22, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

649,989. System of Electrical Distribution for Electric Railways, Fedor R. Koss, Charlottenburg, Germany. Filed March 8, 1900

March 8, 1900.

649,990. Underground Electric-Railway System. John B. Larkin, Pittsburg, Pa. Filed Sept. 9, 1899.

650,030. Apparatus for Operating Contacts for Electric Traction. Arthur Ballance and Samuel A. Jefferson, Hull, England. Filed Nov. 10, 1899.

650,094. Track and Conduit Construction for Underground Electric Street-Railways. John H. Robertson, New York City, assignor of two thirds to Albert J. Elias. same place, and Louis Duncan, Baltimore, Md. Filed Aug 18, 1899.

650,123. Contact Device for Electric Railways. William M. Brown, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 20, 1899.

# ELECTRIC LIGHTS AND APPLIANCES.

649,922. Appearatus for Electrically Lighting Lamps. Henry C. Farquharson. New York City. Filed Sept. 5, 1899. 649,976. Electric Incandescent Lamp. Jacob Atherton, London, Ingland. Filed July 24, 1899. 649,178. Manufacture of Filaments for Incandescent Electric Lights. Samuel B. Husselman, Worcester, Mass. Filed Feb. 16, 1900.

#### ELECTRICAL MACHINERY AND APPARATUS.

ELECTRICAL MACHINERY AND APPARATUS.

649,942. Synchronizer for Electric Machines Carl J. A. Michalke. Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 31, 1897.

649,972. Electric-Motor-Controlling Device. Thomas S. Watson, Milwaukee. Wis., assignor to the Browning Manufacturing Company, same place. Filed Oct. 4, 1899.

649,974. Dynamo-Engine. Murcy L. Whittield, Memphis, Tenn, assignor to the Whitfield Company, same place. Filed April 15, 1899.

650,010. Electric Switch. Jesse B. Heller, Philadelphia, Pa., assignor to the Lorain Steel Company of Pennsylvania, Filed Sept. 23, 1899.

650,067. Controller for Electric Circuits. Abraham L. Waters, San Francisco, Cal. Filed Aug. 2, 1899.

650,168. Electrical Switch. Edward J. Wade, London, Eng. Filed March 8, 1900.

650,141. Static-Induction Generator. Rome V. Wagner, Chicago, Ill. Filed Nov 29, 1899.

650,196. Switch for Electric Motors. Gustav A. Schoeller, Mulheim-on-the-Ruhr, Germany, assignor to Fried. Krupp. Essen, Germany. Filed Feb. 1, 1900.

650,244. Armature for Dynamo-Electric Machines. Gustavos Heidel, St Louis, Mo. Filed Sept. 18, 1889.

#### TELEPHONES AND TELEPHONE APPARATUS.

649,859. Signal for Trunk-Lines of Telephone Systems. Charles E. Scribner, Chicago, Ill, assignor to the Western Electric Company, same place. Filed June 17, 1898.

# MISCELLANEOUS.

MISCELLANEOUS.

649,917. Electric-Shampoo Apparatus. Henry C. Doersch and David W. Cranston, Nyack, N.Y. Filed Oct. 11, 1899.

649,933. Electric Releasing Device for Shutters. James Hueston, New York City. Filed Aug. 19, 1899.

649,930. Battery-Plate. James K. Pumpelly. Chicago, Ill., assignor to Sanuel W. Ehrich, New York City. Filed July 19, 1898. Renewed Oct. 27, 1899.

649,994. Automatic Circuit-Cosing Telegraph-Key. Louis F. Ritchie, Elwyn, Pa. Filed Oct. 12, 1897. Renewed Oct. 20, 1899.

649,998. Element for Storage Batteries. Elmer A. Sperry, Cleyeland, O., Filed Sept. 30, 1899.

F. Ritchie, Elwyn, Pa. Filed Oct. 12, 1897. Renewed Oct. 20, 1899.
649,998. Element for Storage Batteries. Elmer A. Sperry, Cleveland. O. Filed Sept. 30, 1899.
650.014. Electric Motocycle. Isidor Kitsee, Philadelphia, Pa. Filed July 3, 1899.
650.015. Electric Welling. Eugene Lagrange. and Paul Hoho, Brussels, Belgium. Filed Aug. 15, 1892.
650,051. Electroplating Apparatus. Louis Potthoff, New York City. Filed Aug. 2, 1899.
650,062. Thermo-Electric Pile. Lucian Gottscho, Charlottenburg, Germany. Filed Dec. 19, 1809.
650,090. Electrical Ear-Trumpet. Frances McDaniel, New York City. Filed Dec. 1, 1899.
650,096. Recorder for Rapid Automatic Telegraphy. Carl F. Rodde. Berlin, Germany, assignor to Siemens & Halske Aktlen-Gesellschaft, same place. Filed Feb. 3, 1900. r. Rodde. Berlin, Germany, assignor to Siemens & Halske Aktien-Gesellschaft, same place. Filed Feb. 3, 1990.
650, 109-650, 110. Apparatus Employed in Wireless Telegraphy Guglielmo Marconi, London, Eng., assignor to the Wireless Telegraph & Signal Company, Limited, same place. Filed Oct. 12, 1869. Dec. 28, 1819.
650, 113. Insulating-Coupling. Louis McCarthy, Boston, Mass. Filed March 9, 1899.
650, 115. Insulating-Coupling for Electric-Wire Conduits. Gardner W. Proutty, Littleton, Mass., assignor to the W. T. C. Macallen Company, Boston, Mass., Filed April 27, 1899.
650, 124. Electric Metal-Working Apparatus. Clyde Coleman, Chicago, Ill., assignor, by direct and mesne assignments, to the Bankers, Electric Protective Company, same place. Filed July 29, 1897.
650, 172. Telegraphic Sounder. Allen A. Dittmar, Jersey City, N. J., assignor to the Manhattan Electrical Supply Company of New Jersey. Filed Feb. 26, 1940.
650, 188. Phonograph. John Oertly, Cincinnati, O. Filed Nov. 13, 1899.
650, 219. Storage-Cell, Fred W. Barhoff, Hartford, Conn., assignor, to the Manhattan.

Nov. 13, 1899.

Storage-Cell. Fred W. Barhoff, Hartford, Conn., assignor to the Hartford Accumulator Company, same place. Filed July 29, 1899.

Storage-Cell. Fred W. Barhoff, Hartford, Conn., assignor to Charles E. Scholler, Philadelphia, Pa., assignor to Charles E. Wilson, same place. Filed May 20, 1899.

1899.
650,274. Voltaic Battery Operated with Fused Materials.
William S. Rawson, London, Eng. Filed June 19, 1899.
659,275. Electric-Light Dimmer. Henry E. Reeve, New York City, assignor, by mesne assignments, to the Electric Regulator Company of New Jersey. Filed Aug. 25, 1890.

1899. 305. Composition for Exciting Fluid for Flectrical Bat-teries. Frank G. Curtis, Everett, Mass., assignor to the Automatic Electric Pump Company, Boston, Mass. Filed

Automatic Electric Pump Company, Boston, Mass. Filed Aug. 21, 1899. 35%. Fire-Alarm Telegraph Apparatus. William H. Kirnan, Bayonne, N. J., assignor to the Gamewell Fire Alarm Telegraph Company, New York City. Filed Oct. 13, 1809.

# GENERAL NEWS.

# What is Going On in the Electrical World.

#### LIGHTING.

Alexandria Bay, N. Y.—The St. Lawrence International Electric Compay, recently formed here, has been reorganized, and its capital stock increased from \$20,000 to \$30,000. The lighting capacity of the plant will be eniarged at once to 6,000 lights, giving a total of 8500 lights, and cables will be laid to the islands in the vicinity of the place, while the plant will be equipped with new boilers and apparatus. Jacob Amos of New York is president. of New York is president.

Allentowa, Pa - Tae city councils recently entered into a ten-year contract with a local company to light the city with electricity at \$74.50 per arc lamp a year.

Arcadia, Fla.—The citizens are agitating the question of building an electric light plant

Ashland, Ill.—An electric light plant will soon be installed here. The people have already appropriated \$5,000 for the enterprise. Address Dr. D. S. Gailey, president of village board.

Barrien Springs, Mich.-An electric light plant will soon be erected here.

Chrisfield, Md.—Bids will be received until June 15 for the erection of an electric light plant. Address, J. H. Fontaine, secretary and treasurer of Chrisfield Ice Manufacturing Company.

Clinton, Ill—An electric light plant is to be erected here. Messrs. R. Saell and E. S. Nixon are interested. Corydon. Is —Bonds will be sold July 21 for erecting a municipal electric light plant to cost about \$12,000.

Eddwille Is. - At a recent election the citizens voted ond this town for \$7.000 for an electric light plant.

Ellensburg, Wash.—The municipal electric lighting plant here is to be improved at a cost of about \$3,000.

Florence, Ala.—This city will have electric lights within six months.

Frankfort, Ind.—This city will have a new electric light plant and will issue bonds amounting to \$40,000

Fredricksburg, Va.—The light committee of the city council has advertised for bids for the erection of an electric light plant.

Halifax, N S.—The council is considering the question of building an electric light plant.

Hastings. Nab.—The city council is making arrangebuild a new \$20,000 electric light plan

Kosciusko, Miss.—The Kosciusko Oil Mill & Fertilizer Company has purchased the city electric light plant and will improve, enlarge and operate the same.

Lake Charles, La.—This city will receive plans for its proposed electric light plant in about two months. Address, G. T. Bock.

Lexington, Miss.—The Lexington Ice, Light & Water Company will build an electric light plant and water works. Address H. W. Watson.

Ludlow, Vt.-The city council is discussing the question of erecting an electric light plant.

Mauning, S. C.—The citizens of this place are agitating the question of building an electric lighting plant.

Muskegon, Mich - The Muskegon Electric Light Company will make extensive improvements to its plant this season. A new battery of boilers and a new engine will be installed.

Neligh, Neb —This place is to have electric lighting in the near future.

Olivet, Mich — Plaus are being formulated for the erection of a new electric lighting plant at this place.

Owensbore, Ky.—Plans and specifications are being prepared for the erection of a new electric lighting plant at this place to cost \$49,000.

Plymouth, Wis.—The common council has voted to light this city by electricity.

Spencerville, O —The citizens of this place will soon ote on the question of issuing bonds for the construction of an electric light plant.

Wharton, Tex.—B. W. Farencamp of Shiner, Tex., contemplates the erection of an electric light plant

# STREET RAILWAYS.

Amsterdam, N. Y. - The Amsterdam & Hageman Traction Company was recently incorporated with a capital of \$100,000 to operate a street surface electric road five miles long, from here to the village of Hage-

Baraboo. Wis.—The question of an electric railway between Devil's Lake and the Dells is again being strongly talked of.

Bay City, Mich.—N. B. Bradley, B. Boutell, W. H. Hurley, M. A. Boot and A. C. Maxwell have been appointed as a committee to solicit aid for the proposed electric road to Sebewaing.

Cincinnati, O.—This city is considering the plan of operating one or more of its roads by electricity.

Crown Point, Ind.—Ed. Thistlewaite of Cedar Lake and a party of Chicago capitalists are figuring on an electric line from Cedar Lake to this place and thence

Dallas, Tex.—G T. Bishop, H. B. Coffinberry. G. F. McKay and J. Masterton are interested in the Dallas, Fort Worth and Southern Electric Bailway Company, which has a capital of \$1,000,000. The company contemplates the erection of an electric railway 32 miles long from here to Fort Worth, and of a line 28 miles long from Fort Worth to Cleburne.

Florence, Ala.—An electric railway system is to be established here within fifteen months.

Freedom, N. H.—A new electric railway is being considered in this section, designed to unite towns in Maine and this State now without railroad facilities, maine and this State now without railroad facilities, and the prospect is good for the building of the road at an early date. The proposed line will run from West Ossipee, on the line of the Northern division of the Boston & Maine, through Effingham Falls and this place, in New Hampshire, Porter and Kezar Falls to Cornish, Me.

Fremont, Neb.—Parties here are firm in the belief that the power canal will be an assured fact in the course of a year or two, and see no reason why the proposed electric road between this place and Omaha should not be built.

Niles, O.—A charter has been issued to the Mineral Bidge & Niles Traction Company for the purpose of building an electric railway line. The capital stock is \$50,000. The incorporators are A. A. Anderson, G. F. Arrel, J. E. McVey and H. M. Robinson.

Arrel, J. E. McVey and H. M. Robinson.

Hempstead, N. Y.—The Queens Borough & Nassau County Railway Company was incorporated a short time ago to build and operate a street surface electric road seven miles long, from this village to the village of Queens. The capital stock is \$150,000. Daniel Noble, Daniel Callanan of Long Island City, Patrick J. Mara of Fiushing, Frederick Bomley of Astoris. E. J. M. Kesver of Brooklyn, Henry P. Keith of Hempstead, John B. Merrill of Wood Haven, and Philip T. Cronin of Far Rocksway are the directors.

Johnstown, Pa.—Ry securing the vight of way

Johnstown, Pa.—By securing the right of way through the borough of Ferndale recently the last contacte was removed to the construction of the elec-tric car line from this city to Windber.

Kokomo, Ind.—The county commissioners have granted a franchise for an electric railway line to G. W. Landen of this city. C. E. Cowgill and J. Lyna, of Wahash, trustees for the Kokomo, Wabash & Northern Flatter, Belling of Control of the Control Electric Railway Company.

Nyack, N. Y.—It is stated that the franchises for a trolley line here will be purchased by Mr. Reeves, who will put the road through at an early date.

Wilmington, Del —The P-onle's Railway Company

withington, Del—The Propie's Kailway Company has received permission from the street and sewer directors to build trolley lines in this city. The new company is capitalized at \$750,000, and its officers are J. P. Allmond, president; L. H. Ball, secretary.

# MANUFACTURING.

Chattanooga, Tann.-G. N Henson of this city is in the market for a 70 light dynamo of 110 volts.

East Orange, N. J —The Explosive Vapor Company of this place was lately incorporated with a capital of \$300,000 to manufacture compressed air, electricity, etc. for motive power.

Hartford. Conn -A new company for the manuf ture of incandescent lamps has been formed here. John Camp of this city is interested in the concern.

Camp of this city is interested in the concern.

New Haven, Conn.—The Yale Motor & Power Company with a capital of \$500 000 was recently organized to manufacture and deal in motors, engines, etc. It is said that the company possesses a new patent in steam and electrical engines whi h is exceedingly valuable. The offi ere are Lucian M Foster of Buston, president; Henry W French, of Lexington, Mass., treasurer; and Willis A. Farnsworth, of New Haven, Conn., one of the directors. directors.

Richmond, Va.—A charter has been granted to the Virginia Conduit Company to manufacture electrical equipment and to operate an underground street railway. The capital stock is \$1,000,000. Bichmond, Va.-

# COMPANY MATTERS.

Champaigu, Ill —While the plant of the Champaigu & Urbana Street Bailway, Gas and Electric Company is undergoing repairs, it has been decided to rut in a dynamo especially to furnish at all times an alternating current, this having been provided heretofore only at night. at night

Pierre. S D.—W H Carlson and H C. Balcom are interested in the McCloud River Electrical Power Company recently formed here with a capital of \$1,500,000.

Pittsburg, Pa.—The Carnegie Steel Company has de-Pittsburg, Pa.—The Carnegie Steel Company has decided to make a complete change in the motive-nower system that operates its thirty-irch mill of the Homestead Steel Works. Electricity is to take the place of steam in the operations of the shifting tables at the rolls. This will take considerable time, as it means the replacing of this portion of the plant with entirely new machinery. The total expenditure for improvements to this mill is estimated at about \$200,000.

Barton, Md.—On account of the breakage of a pump at the Klondike mine the machinery is being repaired, and at the same time an electric plant is being in-

# THE TELEPHONE WORLD.

## Independent Telephone Officers.

The Indiana Mutual Telephone Association, composed of companies that are fighting the Central Union, have elected the following officers: President, John McGregor, Madison; vice-president, Charles M. Zion, Lebanon; secretary and treasurer, Harry B. Gates, Indianapolis; executive committee, John McGregor, Madison; Charles M. Zion, Lebanon; Harry B. Gates, Indianapolis; L. A. Frazee, Connersville; Hugh Dougherty, Bluffton; A. F. Ramsey, Crawfordsville; G. W. Beers, Ft. Wayne.

President Balfour of the Keystone Telegraph Company, the new independent telephone company which proposes to operate a system in Philadelphia, announces that the company will be ready to do business within a year. As was stated a short time ago, the company has acquired a franchise from the city to lay its conduits and wires, and the active construction will commence in a few weeks. The plans are now being drawn. The opponents say the Keystone Telephone Company will not be permitted to do business in the city without a legal contest. It is said that an attack will be made on its charter which it has taken out in New Jersey. The attorneys have taken the ground that a New Jersey company has no right to acquire vested rights in public roads and highways in

The Bell Telephone Company has completed plans for extensive additions to its service in the State of Wyoming. It will build a line north from Cheyenne to Casper, Douglas, Lusk, Glenrock, and on into the northern part of the State to Newcastle, Sheridan. Sundance, Buffalo and to Deadwood, and Lead City in the Black Hills. The company has planned to connect Lander, Thermopolis and Fort Washakie with the main line, through southern Wyoming, either at Rawlins or Rock Springs. It is predicted that inside of twelve months every town of any size in Wyoming will be connected with Denver on the south, and Salt Lake City and Ogden on the west by long distance telephone.

The officers of the Little Wolf Telephone Company have not yet filed their acceptance of the franchise recently granted by the council of the city of Oshkosh, Wis. The council passed the ordinance granting the Little Wolf Company a charter two weeks ago and about two weeks still remain in which to file an acceptance and a bond for the performance of the work, according to the charter. The franchise calls for the completion of an exchange by January 1, 1901.

It is stated that the People's Mutual Telephone Company recently organized in San Francisco, Cal., has contracted for \$300,000 worth of material. It is the purpose to put in an improved Bell telephone system, and the rates will be 60 per cent. lower than those now charged in San Francisco. Work will be commenced before July 1.

The Weakley County Telephone Company of Martin, Tenn., which was incorporated in March, 1839, is branching out, and arrangements are being perfected whereby it will take in every town in Weakley County. The company has been in operation nearly one year, and has already earned a dividend of something like 20 per cent.

The application of the Home Telephone Company for a franchise in Columbia, S. C., has been unfavorably reported on by the street committee to whom the matter was referred.

At a recent meeting of the stockholders of the People's Telephone Company of Biloxi, Miss., it was decided to sell the exchange to the Cumberland Telephone Company. The latter corporation expects to take charge of the system and refit it at once.

The Southeastern Massachusetts Telephone Company has been granted the right to erect poles in Brockton, Mass. The company is constructing a telephone line from Wareham to Boston.

The New York and New Jersey Telephone Company is making arrangements to establish a local telephone exchange in East Hampton, N. Y. If the company can secure twenty subscribers an undergr und system will be put in.

It is stated that B. F. Thompson and W. B. Hunt are planning to build a telephone system in Scottsboro, Ala. Quite a number of prospective subscribers have already been obtained.

The town of Schaller, in Sac County, Iowa, with a population of 400, is about to put in a telephone system.

## Damage Suit Against the Bell Company.

George C. Stone, a resident of Thomasville, Ga., has brought suit in the United States Court against the Southern Bell Telephone Company to recover \$26,900 damages.

The plaintiff alleges that he was a subscriber to the telephone company, as was also the Thomasville Fire Department, and that it was the business of this company to furnish to each of its subscribers means of communication at all hours of the day and night. This they failed to do, the plaintiff alleges, by reason of which his house was destroyed by fire, he being unable to raise the central office to get the fire department.

Advices from Duluth, Minn., state that Judge Lochren of the United States Court has granted a temporary injunction in the case of the Duluth Telephone Company against the City of Duluth. The suit is brought to enjoin the city from removing the poles and wires of the old company, whose franchise ran out last year. The city made a contract with the Zenith Telephone Company, and is seeking to oust the old company. The Duluth Company claims that it has an irrevocable contract with the State under the general law that gives telephone and telegraph companies the right to the use of roads and highways, claiming that streets are included in that term. The case is practically the same as that recently decided in the district court in Minneapolis. It will come up in the fall and in the meantime the company is restrained from extending its service.

The subscribers of the Cumberland Telephone Company at Lynnville, Tenn.. have been notified that after June 1 they will not get Maury County on the exchange as heretofore. This will greatly inconvenience people generally, and especially business men. Dissatisfaction is being expressed on all sides over the change. A petition has been drawn up and signed by the local subscribers asking the managers to withdraw their orders, and permit them to use the lines as at present. If the petition is not granted a number of withdrawals will immediately take place. The company has a large exchange at Lynnville, and the patronage has always been liberal.

An independent telephone company has purchased the existing rights and line of the Saco and Biddeford Telephone & Telegraph Company, and proposes to begin business in Saco, Biddeford, Old Orchard and Biddeford Pool, Me., in the near future. The new company is composed of George F. West of Portland, Carlos Heard, E. W. Staples, Jere G. Shaw, Charles H. Prescott, and Charles E. Atwood of Biddeford, Hampden Fairfield, Luther R. Moore, A. G. Prentiss and Herbert R. Jordan of Saco.

A dispatch from Peabody, Kan., states that every town and village in Marien County is equipped and connected with a local and a long distance telephone system. The Southwestern Telephone Company, of which H. D. Wells is president, and Charles Sawtelle, treasurer, have 150 'phones in Marion, 125 in Peabody, and a number in Hillsboro and the smaller towns of the county.

Senator Chauncey M. Depew, president of the Transportation Club of New York, addressed that body at its annual dinner last week at the Hotel Manhattan over the long distance telephone from his residence in Washington. It is something like 225 miles from New York to the capital; and it is said that this is the first instance of a speech being made over the telephone at so great a distance.

The Saline County Telephone Company has extended its line from Marshall to Miami, Mo. In a short while its toll lines will reach all towns in Central Missouri. The company was organized last September, and now has in use 328 between the company was set of the company was organized last September, and now has in use 328 between the company was set of the company was organized last September.

The telephone system at Lake Charles, La., is being improved. A considerable amount of cable has been delivered there, and the work of reconstructing has begun.

Five hundred electric wire linemen in Cleveland, O., went on a strike last week. Of them 420 are employes of the Telephone Company. They want \$2.50 for an eight-hour day.

The continual growth of the business of the Southern New England Telephone Company and the constant enlargement and development of its plant has decided it to issue \$100,000 of its first mortgage 5 per cent. bonds.

The American Telephone Company has received a permit to build its pole line from New Lenox, Mass., to the Lee town

The Get'vshurg, Pa. "Sentinel" says: "Few persons have any idea of the number of telephone subscribers connected by toll lines and by direct connection with the Gettysburg exchange. These number no less than 5,400, divided as follows: Adams County Company, 300: Hanover Company, 300; York County, 1,400; Lancaster County, 1,400; Cumberland County, 550; Franklin County, 650; Lebanon, 300; Harford County, Md., 150; Hagerstown, 350. Negotiations are being made for additional extensions and connections with independent companies in Pennsylvania and Maryland, and it will not be many months before the independent companies have long distance service equal to that of the Bell Company. There are in the independent telephone service in Pennsylvania and New Jersey 40,000 'phones now in use and the number is increasing daily. Of the 67 counties in Pennsylvania 57 have independent companies, and of the 21 counties in New Jersey 18 have independent service. Movements are on foot that will connect all of the greater part of these companies. In Philadelphia it is expected that the granting of a franchise to the Keystone Company means the introduction of independent service in that city, which will then also be connected with the independent toll line service. The Home Company of Baltimore is pushing out its lines, and very soon that ci'y will be a center of independent long distance telephone service."

[Vol. XVIII., No. 21,

The Rawson Electrical Company of Ohio, which concern is the parent of the Home Telephone Company of Niagara Falls, was granted a franchise in North Tonawanda, N. Y., recently. The application of the Bell Company for a similar franchise was turned down. The granting of the franchise, which was unanimous, means cheaper telephone service for the Tonawandas, and a death blow to the Bell Company in that city. The franchise granted was on the condition that the independent company complete its lines within one year, and not charge more than \$36 a year for rental of a business phone and \$18 a year for private house instruments.

The new Lackawanna Telephone Company, which is under the same management as the People's Telephone Company of Wilkes-Barre, Pa., has filed a mortgage of \$500,000 in favor of the Anthracite Savings Bank of Wilkes-Barre. The mortgage is to guarantee an issue of 5 per cent. thirty year bonds to that amount. The money will be used for constructing the company's plant in Lackawanna County. The issue was authorized at a meeting of the directors April 23 last, when the capital stock was increased from \$10,000 to \$600,000. The mortgage required \$250 in revenue stamps.

Articles of incorporation for the West Salem Telephone Company have been filed with the register of deeds, at La Crosse, Wis. The incorporators are William Lohmiller, J. G. and C. H. Schweizer. The company will establish an exchange at West Salem, and will also connect with the line of the La Crosse & Southern Telephone Company. Work has already begun on the construction of the system.

The Hampden Automatic Telephone Company, through a third party, is said to have purchased a valuable site in Springfield, Mass., and will erect an office building, reserving for its own use the upper stories. The building will be the local central office and also county headquarters. The backers of the company claim that its lines will be in operation within a few months.

A company has been organized at Troy, Kan., to construct a telephone line from Atchison, Kan., to Falls City, Neb. The work will be commenced in a very short time, and the following towns will be connected by the system: Atchison, Doninan, Brenner, Troy, Farmington, Highland Station, Highland, Iowa Point, White Cloud, Rulo, Reserve and Falls City.

# TELEPHONE INCORPORATIONS.

The Springer & Millshoals Telephone Company, Springerton, Ill. Capital stock \$2,500. Incorporators: John W. Springer, John N. Upton, and L. W. Hendershott.

The New Prague Telephone Company, New Prague, Minn. Capital stock, \$10,000. Incorporators: S. A. Vopatak, J. F. Barta, M. Rybak, all of New Prague.

The Smith-Lake Telephone Company of El Dorado, Ark. Capital stock \$15,000. Incorporators: E. H. Smith, J. A. Rowland and E. H. Lake.

The Akron People's Telephone Company, Akron, O. Capital stock, \$200,000. Incorporators: W. Christy and A. B. Conklin.

The Jefferson Telephone Company, Guthrie, Ok.—to build and operate a telephone system throughout Oklahoma and In lian Territory. Capital stock, \$10,000. Incorporators: D. M. McKinstry, E. D. Nims, John M. Noble, E. E. Westervelt, Perry; F. D. Hummer, Washington, D. C.; W. E. Cald well, Louisville, Ky.

# LECTRICA SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electractry from a variety of sources.

The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem is a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 161@161c.; Lake, 161@161c.; casting, 161@161c.

The employes of the United Electric and Power Company of Baltimore, Md., have struck for higher wages.

A fluxucial paper states that the impression continues strong that the Metropolitan's \$7,000,000 stock issue will be taken by insiders at a high figure.

The president of the Electric Vehicle Company states that there is no likelihood of acceptance of the proposition to unite with the Anglo American Vehicle Company.

The Sawyer Electrical Company of Philadelphia, Pa., has made an assignment for the benefit of creditors to Alfred H. Faber. The deed is dated April 26 last and conveys no real estate.

A certificate of merger of the Kings County Elevated Bailroad Company with the Brooklyn Union Elevated Bailroad Company was filed with the Secretary of State at Albany on the 24 h inst. The action is purely formal.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 19@21; New York Electric Vehicle Transportation, 8@81, New England Transportation, 4@41; Gramophone, 40@45.

An alliance for legal protection is said to have been entered into by the National Gramophone Corporation, the Universal Talking Machine Company, the American Graphophone Company and the Columbia Phonograph Company.

The Elmira Water & Light Company of Elmira. N. Y., with a capital stock of \$1,000,000, filed papers of incorporation with the Secretary of State at Albany last week. The company purposes to generate and distribute electricity.

It is said that an application will be made immediately in the Supreme Court by Brooklyn, N. Y., organizations for an order to enforce single fare law and so prevent the Brooklyn Bapid Transit Company from doubling Coney Island fares.

The United Traction Company of Albany, N. Y. (operating Albany and Troy surface roads), reports for the quarter ending March 31: Gross, \$299.047; net, \$91,-469; other income, \$1,002; total income, \$92,471; fixed charges, \$58,654, surplus, \$33,817.

The stockholders of the Amherst & Sunderland Street Railway Company of Amherst, Mass., have voted to authorize the directors to issue additional stock to the amount authorized under the charter, namely \$50,000, for building a new power plant and for an extension of the line to Sunderland.

The Hope Electric Appliance Company of Lewiston, Me., has increased the capital stock of the corporation from 10,000 shares of \$100,000 par value to \$500,000. Of this 25,000 shares are preferred stock entitled to cumulative dividends of 7 per cent. The number of directors is increased from three to five.

Advices from Cincinnati state that the Southern Ohio Traction Company, operating between Dayton and Cincinnati, has filed a mortgage to cover \$2,000,000 tweny year five per cent. bonds. The issue will be used to redeem \$1,300,000 existing liens and the rest for improvements.

The Directors of The London & River Plate Bank, Limited, London, have declared an interim dividend of eight per cent. forsix months. As will be seen by the card on another page of ELECTRICITY, this bank has established branches in the following cities: Para, Pernambuco, Rio Janeiro, Santos and Sao Paulo in Brazil: Buenos Aires. Roeario, Babia Blanca and Mendoza in the Argentine Republic: Montevideo and Paysandu in Uruguay.

The Massachusetts Electric Companies is offering to exchange its stock for that of the Lowell & Suburban on the basis of 2 shares of preferred and 1½ shares of common stock for each share of Lowell & Suburban. At the time of the organization of the Massachusetts Electric Company it was unable to secure a control of the Lowell & Suburban, and a proposition was made to lease it on a basis of 7 per cent. for 5 years and 8 per cent. for 20 years. It is understood that a majority of the stockholders are favorable to the acceptance of the proposition.

At the annual meeting of the Kensington Electric Light Company, held on May 23 at the company's offices in Philadelphia, Pa., the following officers were elected. President, William McIutyre, vice-president, Nathan Pollock; secretary, E T. Wilkenson; treasurer, W. C. Bird; directors: J. B. Harbison, F. S. Christian and Nathan Pollock. The report for the fiscal year showed that the receipts amounted to \$130,228 30, while the payments were \$105,309 30, leaving a cash balance of \$24,919. A divider d of \$1 per share, amounting to \$12,721.25, was paid before the cash balance was struck fore the cash balance was struck.

The balance sheet of the Kings County Electric Light & Power Company, as of May 1, shows: Assets—Property and construction account, \$3,143,261; Central Trust Company of New York, trustee, \$1 000,000; stock in other companies, \$5 175,770; discount, \$100,000; bills receivable, \$175,000; general accounts receivable, \$950; cash on hand and in bank, \$64,044; total, \$9.659,025. Liabilities—Capital stock, \$1,950,000; first mortgage 5 per cent. gold bonds, \$2,500,000; purchase money, 6 per cent. gold bonds, \$5,175,900; profit and loss account, \$25,474; accounts payable, \$7,651; total, \$9.659,025. \$7,651; total, \$9,659,625.

The Elm Street Connecting Railway Company filed articles of incorporation in The Elm Street connecting Railway Company fled articles of incorporation in the Secretary of State's office at Albany last week. The capital stock is \$20,000. The incorporators are recognized as being connected in various ways with the Metropolitan Street Railway Company of New York City. Charles E. Warren subscribes for the greater part of the capital stock. It is understood when the rights are secured for this company that the railroad will serve as a very valuable feeder to the Metropolitan system. It will be used in connection with a line to be built on Lafayette Place for which the Bleecker Street and Fulton Ferry Railroad Company has rights. has rights.

The market for copper has been gradually tending to a lower level, says the The market for copper has been gradually tending to a lower level, says the Boston "News Bureau." Sub-rosa terms considerably below published official quotations have been possible for some little time but consumers and exporters have adopted an exceedingly conservative policy and as a consequence sales have been difficult to effect. Meanwhile values have been settling and have reached the level of about 16½c, with more sellers than buyers. Business is heard of at figures inside of prices popularly quoted, but the quantity was not large, and the brand other than lake. The feeling is that the market will have to become more settled before activity can be expected. tivity can be expected.

On May 24 Hugh J. Grant, receiver of the Third Avenue Railroad Company, turned over his charge to President Vreeland of the Metropolitan Street Railway Company. In doing so he said: "In pursuance of the order of the Court, granted on May 23, vacating the interlocutory order and discharging the receiver, and having received your affidavit that you have deposited the sum of \$23,000,000 with the Morton Trust Company, I now formally resign the Third Avenue Railroad to you" Before the formal transfer was made, Kuhn, Loeb & Co., had paid the Morton Trust Company for the \$35,000,000 of honds issued by the Third Avenue Company. The Trust Company will pay claims against the Third Avenue road as soon as they are audited by the Secretary of the Metropolitan Street Railway Company and the treasurer of the Third Avenue Company.

# EDITORIAL NOTES.

The Behr Mono-Rail Electric Railway Scheme.

In view of the interest that is being taken in this country in rapid transit, a few words in reference to the discussion that is going on in England, re-

garding the connecting of Manchester with Liverpool by means of the Behr mono-rail electric railway, should prove interesting.

This railway, as stated in the issue of ELEC-TRICITY of March 29, 1899, is the invention of Mr. F. Behr, an Englishman. As the name indicates, the cars run on a single rail, elevated several feet above the ground, supported on A-shaped steel trestles. The cars, which have a seating capacity of 100, are double-deckers about 60 feet in length and equipped with four motors. To sustain the car in an upright position as well as to prevent derailment, a number of horizontal guide wheels are provided which run upon specially devised guide rails. In this system no overhead conductor is made use of, the current being delivered along the line by means of a third rail which rests upon the trestles, but which is insulated from them.

With this explanation of the system, the following discussion which recently took place before a Parliamentary Committee sitting in London, appointed to examine into the question and for which we are indebted to our London correspondent, will readily be under-Mr. Behr, in appearing before the committee, quoted the result of his Brussels experiment [see Electricity March 29, 1899] where, in spite of curves, a speed of 83 miles an hour was obtained, a proof that "given a properly constructed line and stations, there is no difficulty in increasing speed to 110 or 120 miles an hour." Mr. Behr was so confident that he offered a \$500,000 deposit as a guarantee of his ability to do what he said. M. Gérard, who is engineer-in-chief to the Belgian State Railway, and president of the Belgian Society of Electricians, and who had investigated the Brussels line for the Belgian Government, was convinced that on the Manchester-Liverpool line a speed of 100 to 110 miles could be easily attained and maintained. Sir William Preece in evidence said that the generating station for the system would be built at Warrington, nearly the center of the line. Threephase currents will be distributed to sub-stations at intervals of three or four miles. It

would there be transformed down from 10,000 to 1,000 volts. Sir William Preece is of deliberate opinion that the whole scheme is engineeringly and commercially sound. A ten minute's service is proposed for most of the day, and a fifteen minute's service during the other portion. The train mileage is set down at 1,500,000 per annum, and 7½ units would be consumed per car mile. The total cost of haulage is put at below 14 cents per car mile against 16 and 20 on steam lines. The working expenses will be roughly \$375,000 per annum.

The question of brake power is at present in the experimental stage. What is to be feared is the generation of heat.

Mr. Cottrell, the engineer of the Liverpool Overhead Railway, thought the scheme feasible, but questioned the speed of 110 miles. If a train had to be stopped within 500 yards, great inconvenience to passengers must be caused. It could be done comfortably within 900 yards by short-circuiting the motors. Mr. Parshall and Dr. Edward Hopkinson also supported the proposal.

There are to be no intermediate stations between Liverpool and Manchester. The scheme is promoted largely by business men of the two cities, men who recognize the need for a better service than now exists. The capital of the company is \$10,000,000 with \$3,360,000 in debentures. The cost of construction works out at \$8,750,000.

A Combination Telephone and Phonograph.

During the past few years various electrical devices have been brought out with a view to recording a message or speech in the ab-

sence of the party to whom the message is being sent. Prof. Grey's telautograph regarding which so much was heard a few years ago, was primarily intended to accomplish this purpose, as was neidentally the several pictures or recording machines, such as the telepantograph, the telediagraph and others. With the exception of the telautograph, the devices mentioned equire considerable manipulation before a message can be recorded, and probably for this reason they have not as yet come into extensive use, although they have been employed to a certain extent for transmitting pictures and like nesses over considerable distances.

With a view of simplifying the apparatus, a Danish engineer by the name of Paulsen has hit upon the plan of combining a telephone and phonograph for this purpose, which is

simple in operation, and which is said to give excellent results. This ingenious instrument was referred to several months ago in Elec-TRICITY, but at that time the details of its operation had not been made known. present, however, the device is on exhibition at the Paris Exposition, and its modus operandi has been explained. As previously stated, the so-called telegraphone is a sort of combination of telephone and phonograph, capable of being used either as a registering telephone or as a phonograph of a much more perfect type than any now in use. The phonograph differs materially from that invented by Edison, in that the wax cylinder is done away with. The principle of its operation is explained in a recent issue of the London "Electrical Review" as follows:

"The principal difference between the ordinary phonograph and the telegraphone consists in the fact, that in the latter instrument the 'phonetic writing' of the sound waves is not performed mechanically, but only magnetically by means of an electro-magnet, the moving basis being made of steel or nickel instead of wax or similar substance. To explain the action: Suppose the electro-magnet to be magnetized by telephone currents, while say a steel band passes just close along its poles, the surface of the steel will be permanently magnetized more or less strongly, corresponding to the varying magnetism of the electro-magnet, viz., to the telephonic currents. On reversing the action by again letting the steel band, 'prepared 'as above-in proper direction-be moved quickly in front of the poles of the same or another electro-magnet, whose windings now are to be connected to a telephone. varying currents due to the different magnetization of the steel band are induced in the said windings, causing the telephone to repeat exactly the sounds once fixed upon the telegraphone as often as is desired."

Referring to the details of its toperation the above quoted paper says:

"A very small electro-magnet, say some few millimeters long, is sufficient as well for 'writing' as for 'reading.' Instead of a steel band, it has in some instances been found more practical to use a pianoforte wire wound screwthreadlike in grooves upon a horizontal drum rotated, for instance, by a small electro-motor, while the 'writing' or 'reading' electro-magnet is shifted along a metallic rod parallel to the axis of the apparatus by means of the screw-laid windings themselves. When all the wire has been 'used,' the electro-magnet is automatically detached, and quickly brought back to its starting position by a special arrangement."

It is further stated that another engineer by the name of Peterson has invented a method by means of which several different speeches may be recorded upon the telegraphone and reproduced at will separate and distinct.

Numerous trials have shown that the telegraphone can be made to reproduce speech as genuine and free from secondary sound as the telephone itself, and as our contemporary states in comparison with the phonograph, it has the advantage that the phonetic writing, although not to be wiped out in a mechanical way, may be very easily obliterated by sliding a rather strong magnet (or magnetized electromagnet) along the surface of the steel basis; indeed, whenever this is done, every trace of the writing is done away with and the instrument is once more fit for receiving new impressions.

That there is a demand in the commercial world for an instrument of this nature there is little doubt, as it would enable orders or messages to be received and preserved until wanted. Like all innovations, however, it will probably make but slow progress at first, so that it may be several years before the office boy can be dispensed with.

\* \* \*

## High Tension Electrical Effects.

Of late high-tension electrical effects are coming more and more into vogue for advertising and exhibition purposes. This

is probably owing to the fact that ordinary electric illumination having become a necessity, no longer attracts and rivets the attention of the public as it was wont to do some years ago. There is also a certain amount of attractiveness to most people on high voltages, due presumably to an imaginative element of danger. It is for these reasons that scarcely an exhibition of any kind takes place, but what one of its principal features of attraction is a high tension electrical display, arranged either so as to form the letters of a word or as a simple spark discharge. In this respect the Exposition now going on in Paris was no exception to the rule, and arrangements were early made to decorate the facade of the Palace of Electricity with a worthy display of this nature.

The electrical plant to produce the desired effects was designed and constructed under the supervision of M. D'Arsonval, and embodies several novel features, which are described in a foreign contemporary. For the purpose in view it was necessary to be able to obtain at will either short or long sparks, which had moreover to be very brilliant or very noisy. The desired end was attained by the discharge of very powerful condensers charged to a high potential by an alternating current transformer. The latter is of 30 kw. capacity, and the alternator to which it is connected has a periodicity of 42 cycles per second. The primary of the transformer consists of two sections, which can be coupled either in parallel or in series. The high tension circuit can be relied on to work up to 90,000 volts for prolonged periods, or to even higher voltages, so it is claimed, for a shorter length of time.

The condenser is said to have given much trouble at the outset, since when glass was used as the insulator even in a thickness of 5 millimeters (.196 in.), it was invariably pierced by the sparks, while ebonite, celluloid and paraffined paper proved equally ineffective.

Finally, however, micanite was adopted, and has resisted satisfactorily. The condenser has been built up of alternate layers of very thin tin-plates and sheets of micanite 2 millimeters (.079 in.) thick, 365 millimeters (14.37 in.) in length, and 285 millimeters (11.22 in.) in breadth. There are twenty such layers, the capacity of each being about one-hundredth of one microfarad.

These condensers have given entire satisfaction. They do not heat, and being immersed in paraffine lose nothing by brush discharges. The spark is passed between two balls, the formation of a permanent arc being prevented by a blast of air or by the device due to M. D'Arsonval, of causing the balls to rotate by means of a small motor, the rush of air being then sufficient to prevent the formation of an arc.

Those who have witnessed the display with this arrangement assert that it is very striking. The length of spark obtained with the condensers charged to 50,000 volts, is 18 to 20 centimeters (7.08 in. to 7.87 in.), but by suitably adjusting the speed of rotation of the two balls, the apparent length can be greatly increased, owing to the persistence of the vision, and in this way sparks appearing to be nearly 12 meters in length, have, so it is asserted, been obtained

Altogether, the arrangement for a high tension display, devised by M. D'Arsonval, is most ingenious, and it remains to be seen whether it will be surpassed in point of spectacular effect by anything of a similar nature at the Pan-American Exposition.

# Notes and Comments on Várious Topics.

THE War Department recently awarded a contract to the Safety Wire and Insulating Company of this city for the construction of 500 miles of cable to be used in the Philippines The contract price is \$330 per mile. The company agrees to have the cable ready by September 1.

THE water supply of Brooklyn is so low, it is stated, that the residents of that borough will be compelled to forego seeing for the rest of the season the gorgeous display of light and color made by the electric fountain at the Prospect Park Plaza. If water is at a premium, why not alter the existing fountain to an illuminated one without water, such as exists in the Spanish section of the Paris Exposition, and which was described recently in Electricity.

To prevent loss of electrical power by leaky rail joints the Grand Rapids (Mich.) Railway Company will weld the joints on all new construction. An apparatus for this work is being built by the company, and when completed will be moved about as a furnace on wheels.

At a recent meeting of the Central Federated Union in this city a letter was read from Col. Kipp, Chief Clerk of the Police Department, stating that the law requires an engineer's license for every one operating a boiler which carries more than ten pounds of steam. "Steam automobiles," he said, "carry about 225 pounds and therefore come under the operation of this law." The owners of automobiles of which electricity is the propelling power are safe from the police, as the law deals only with vehicles of which steam is the motive power.

QUOTING from a German publication, the London "Electrical Engineer" states that the heat generated by an ordinary incandescent lamp is greatly underestimated by the general public. Experiments have proved that a small incandescent lamp placed in a vessel containing half a liter of water will heat the latter up to boiling point within less than an hour. An incandescent lamp placed in contact with celluloid will ignite the same in five minutes. It is also very dangerous to place incandescent lamps in the proximity of cotton wool, for after a very few minutes the wool is scorched and ignited. Silk is less inflammable, but even this is scorched at a distance of 3.9 inches in from eight to ten hours.

BRIGADIER GENERAL GREELY is reported to have directed the establishment of wireless telegraphy stations in the harbor of San Francisco and in Porto Rico and the Philippines.

In New York harbor it is possible that the wireless telegraph system may take the place of the cable connecting Fort Hamilton and Fort Hancock. This cable was recently found to be cut in eleven places. It is desired to connect the various points in San Francisco harbor at which guns are located. Wireless telegraphy, it is believed, will give better results than a cable. In Porto Rico, Crab Island will be connected with some port on the coast of the larger island, but the establishment of the stations there is merely in order to give officers of the army an opportunity to learn how to operate the system. In the Philippines the system will take the place of the heliograph, which now flashes messages between Corregidor Island and Manila, Bohol and Cebu, and other points.

THE time limit for the placing of fenders on Camden (N. J.) trolley cars under an ordinance recently passed by the City Council expires on June 29. A resolution has been adopted instructing the Mayor and chief of police to stop the running of all cars not equipped with fenders after that date. The street committee prior to the meeting of City Council rescinded their action in approving a wheel guard for the trolley cars and insisting on the use of

NEWS from Milwaukee, Wis, states that an iron mast 150 feet high is soon to be erected at South Point, from the top of which experiments in wireless telegraphy will be made. Messages will be sent and received between South Point and North Point Lighthouse and South Point and Racine Lighthouse, and then experiments of sending and receiving messages to and from vessels under full headway in the lake will be made. The experiments will be made for the benefit of the company owning the patents, and will be conducted by Lee De Forest, a graduate of the Yale Scientific School, and Charles E. Fortier, of the Jonson Electric Service Company.

Some interesting experiments, it appears, are at present being conducted in Budapest, Hungary, with high-pressure rotary current for working an electric railway. It is stated that, despite the high working pressure of 3,000 volts which is used, the system ensures complete safety even in its application to mainline working. Experimentally, the system is to be introduced on to the Valtelina stretch of the Italian State Railways, which has a length of almost 66 miles. The length of the cars which are worked by the new system amounts to 60 feet, while the speed attained is about 37 miles per hour.

The newest, and probably the best equipped electrically, of the world's fleet of cableships is the Von Podbielski, which has just been finished on the Clyde. She was built for a Cologne, Germany, firm of cablemakers and layers and is 255 feet long between perpendiculars and has a moulded breadth of 35 feet. When fitted out for sea her dead weight carrying capacity will be about 1,300 tons. She has three cable tanks and her main deck is flush from stem to stern to facilitate handling the

# The Municipal Electricians.

Arrangements have been made for the next annual convention of the International Association of Municipal Electricians to be held at Pittsburg, Pa., September 25, 26 and 27. It is expected that 200 cities and towns will be represented. Papers on the following subjects will be read: By Capt. William Brophy, "Benefits to be Derived from Our Association;" Frank C. Mason, superintendent of Brooklyn police telegraph, "Contact Points;" M. G. Canfield, Grand Rapids, Mich., "Trials and Troubles of Instituting and Enforcing Municipal Inspection and Control; "Charles Burger, of Boston. "Automatic Fire Alarm Systems." The subject "Advantages and Disadvantages of Carrying High and Low Potential Wires Upon the Same Poles," has not yet been assigned. Two sessions will be held daily. Supt. Mead, who is chairman of the executive committee, is arranging for hotel rates, etc.

## Arranging for the Independent Telephone Convention.

The Independent Telephone Association of the United States meets in Cleveland, O., on June 12, 13 and 14, and arrangements are being made on an extensive and elaborate scale for the accommodation of delegates and their friends. Among other things in the entertainment line will be excursions and a banquet, which may be enjoyed by all visitors free of charge.

The Passenger Associations, covering the entire territory of the United States, have granted a special rate of one and one-third fare the round trip to this Convention. Tickets will be sold on the certificate plan, the purchaser paying full fare going, and upon the presentation of the certificate, which he should procure from the railroad agent at the time he purchases his ticket, he will be granted one-third fare for his return trip. All visitors should arrange with their agent a few days before starting for this rate. Reduced hotel rates will be given in the city of Cleveland. Upon application to C. W. Wason, Electric Building, Cleveland, rooms will be reserved at the hotels.

All persons desiring tickets to the entertainments should make application therefor to the President, James M. Thomas, Room 713, Electric Building, Cleveland, prior to June 12.

The next issue of Electricity will contain the full programme of the Convention.

# Northwestern Electrical Association Convention.

The summer convention of the Northwestern Electrical Association will be held at "Chain of Lakes," Waupaca, Wis., on Tuesday. Wednesday, Thursday, June 26, 27 and 28.

The following papers will be read: "Wet Steam," by W. H. Edgar, of Illinois; "Advantages of Recording Wattmeters on Switchboards," by W. Worth Bean, of Michigan; "Storage Batteries for Small Central Stations," by Louis A. Ferguson, of Illinois-and other papers not announced.

Tuesday afternoon there will be a business session, paper and discussion.

Tuesday evening, grand excursion on lakes in special steamers.

Wednesday morning, business session, paper and discussion.

Wednesday afternoon, "Olympian Games" for handsome prizes.

Wednesday evening, invitation performance by the "Northwestern Minstrels," at Opera House, Waupaca, terminating with a summer night ball,

Thursday morning, business session, paper and discussion.

Thursday afternoon, tub races, swimming matches, boat races, etc.

## SURFACE ELECTRO-MAGNETIC TRAC-TION SYSTEMS.

#### BY FRANK C. PERKINS.

There is no question but that there is a great field for a system of electric traction, in which the overhead trolley is found unnecessary. Many systems have been devised for doing away with the trolley, using both open and closed conduits with varying success. The

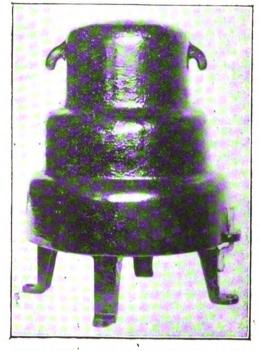

FIG. 1.—100 AMPERE ELECTRO-MAGNETIC SWITCH.

system here described and illustrated is certainly of great interest and has many features which appeal to practical railway engineers.

The "surface contact" or "electro-magnetic "traction system employs surface contacts entirely, the connection between the cars and main feeders being accomplished by electro-magnetic switches, illustrated in Figs. 1 and 2. These particular switches are designed for 100 and 300 amperes, and consist of three

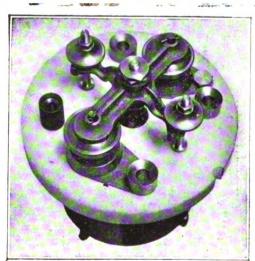

Fig. 2.—300 Ampere Electro-Magnetic SWITCH.

parts, the bell, the pan and the electro-mag netic switching mechanism. These switches are enclosed in moisture proof iron cases, and are each connected on one contact permanently with the positive main or feeder, which is located parallel with the track.

There are cast-iron contact plates or buttons,

two in each group placed between the rails, and electrically connected to the switches. These contact plates may be plainly seen in Fig. 3, which is a view of the track at Indian Head, Maryland, where the system is in operation in the Naval Proving grounds of the United States Government.

A separate switch is employed for each group of buttons. The conductor forming the positive main or feeder is completely enclosed in wrought iron pipe, as will be noted in same view, and is connected to the various switches.

Under each electric locomotive or car is suspended metal contact shoes or bars, as indicated in Fig. 4, which shows a 100 hp. motor car which has been used for several years at the yards of the Westinghouse works where the system is in operation, and forms a junction with the Pennsylvania Railroad tracks. Two bars are suspended to the trucks and a small storage battery is carried on the car, which is required to lift the first switch, and after that has been closed, the contact shoes bridge the main voltage over from one set of pins to another, thus closing the successive switches without further attention from the motorman. The battery is kept charged from the main line by closing certain switches by the motor-

It is claimed for this system that for street railway work it possesses all the advantages of the overhead trolley as well as the underground open conduit systems, while avoiding the disadvantages. It is said the switch boxes are preferably installed outside the track, while the buttons are placed between the rails and mounted on a light metal tie. For double

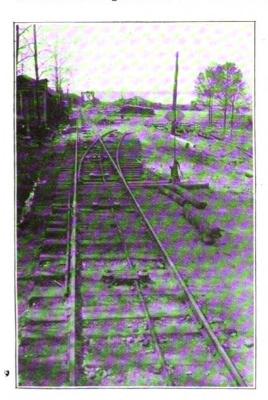

Fig. 3.—ELECTRO-MAGNETIC RAILWAY AT INDIAN HEAD, MD.

track work the switches are placed between the two tracks and the boxes may be built to hold two switches, one for each track.

In some cases but one row of contact buttons is used instead of two. When so arranged it is necessary that the "pick up" current should be of the same voltage as that of the main circuit.

There is no question that a perfectly controlled, economical and simple electro-mag-

netic traction system has many advantages well worth considering. As no poles or overhead wires are necessary, the streets, yards and buildings are left free from all obstructions.

In buildings, manufacturing plants and yards,

ously affected the power delivered by the engines, requiring, too, an abnormal consumption of fuel. In fact, I believe it would actually have required less fuel to produce the results if the exhaust had been turned out of doors and the heating mains connected direct to

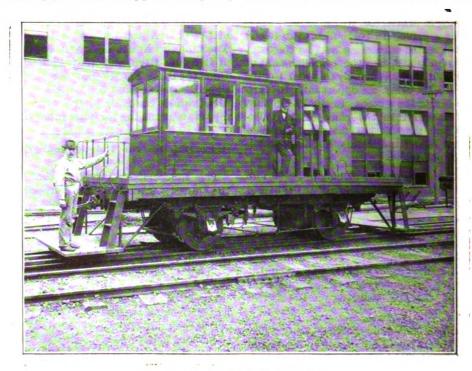

Fig. 4.-100 HP. Motor Car.

freight cars can be handled in either direction without the difficulty of turning the trolley.

It is said the cost is only about one-half that of cable or open conduit system, as there are no deep excavations to be made and can be installed on any road already in operation without tearing up the ties. It is also claimed that the system is perfectly safe, it being impossible for any one on the street to receive a shock.

# UTILIZATION OF EXHAUST STEAM FOR HEATING.\*

BY HARRY J. FRITH, Watseka, Ill

# (Concluded from page 327.)

What is an ideal system? Perhaps the best way to determine this will be to take up the various ways and means of central station heating and consider the advantages and disadvantages of the features that will help in the selection of an ideal system.

The exhaust steam from engines may be used as in the ordinary exhaust-steam heating system. In this case it is delivered direct into the mains, and driven to the points of consumption at a greater or less expenditure of power. To drive this steam, and to increase the temperature in cold weather, it is necessary to carry a back pressure against the engines furnishing the exhaust. Some time since, while investigating the heating question, I found that one station carried a maximum back pressure of seventeen pounds, another of eighteen, another twenty; about half of the ordinary m.e.p of a simple engine working at maximum efficiency. In another case I found that the maximum back pressure was thirty-eight pounds, which equals the usual m.e.p. In this latter case all the engines were high-speed, simple engines, and such a back pressure seri-

\*Paper read at the Twenty-third Convention of the National Electric Light Association, Chicago, Ill., May 22, 1900.

separate boilers. I observed at another time a back pressure of four pounds, with the outside temperature at sixty-three degrees. At the same time a hot-water plant was producing more satisfactory results to its patrons with water leaving the station at 130 degrees Fahrenheit, and returning at 115 degrees Fahrenheit, requiring an expenditure of less power to circulate the water than would be represented by less than one-half pound of back pressure; and there was actually no back pressure other than that which occurs in all engines, due to resistance of parts and exhaust pipes. Clearly, back pressure, even in a small amount, must be avoided, as it is more expensive than equal boiler pressure; for if the point of admission remains fixed, we must raise the boiler pressure nearly a couple of pounds per pound of back pressure. We have also to consider that engines do not usually work as well when laboring against a back pressure. The increased steam consumption calls for the evaporation of more water, and consequently for more labor to keep the boilers clean and the furnaces in repair.

Again, with the use of exhaust steam direct into mains and radiators, there is at least 212 degrees Fahrenheit or none. The increase obtainable at the expense of a back pressure is limited (not considering any objections to a back pressure) to 250 degrees Fahrenheit, the temperature of steam at fifteen pounds pressure. This is a small range when compared with water, which may be varied from seventy degrees to two hundred degrees or more.

With a system of exhaust steam direct into the mains, all the condensation is lost, together with the best in the condensed steam, something like 140 degrees of which is available, and is thrown away into sewers. All condensation of any live steam that may be used in time of an insufficiency of exhaust is also thrown away, and this is a most important loss. If a sewer system is not available into which to discharge the condensation, then one must be provided. The hot condensation discharged into sewers often causes disagreeable odors to back up into plumbing, and calls down the wrath of the health authorities. At all air vents, cylinder oil causes unpleasant odors to give the system a bad name. Then, too, a system of piping that will hold air or water, will leak cylinder oil and cause more or less trouble from this source.

Since the range of temperature in steam-heating mains is from 40 to 250 degrees, greater care must be taken to provide for expansion and contraction than in a system where the range of temperature is through narrower limits; and because the temperature of steam systems runs higher than that of water systems, it follows that better and more expensive covering must be used. There is no perfect covering, hence condensation must take place in the mains. This requires that steam mains be carefully graded to avoid pockets, and where pockets are essential, means must be provided for removing condensation. Water mains, on the contrary, can be run regardless of grade.

Strange as it may seem, I have been credibly informed that in case of shut-down, or of a deficiency of heat in extreme cold weather, a steam system is more apt to freeze than hotwater.

The drift of my talk, then, is toward the ideal system, and it is hot water. As a medium for transmitting heat, water has no equal. It meets all the required conditions, and is acknowledged by engineers, architects, and even by the medical profession, to be the ideal heating medium for residences, stores and public buildings.

With a hot-water system as our ideal, then, how can it be best applied to our needs?

It is evident that the water must be heated in a tubular heater, similar to a closed feedwater heater or surface condenser. It is important that sufficient opening be provided through the tubes so that all the exhaust steam can pass through the heater and to the atmosphere without producing any back pressure on the engines. In other words, there must be an open and free exhaust pipe at all times. Sufficient surface must be provided to condense all the exhaust steam delivered by the engine and to allow none to escape. The water is circulated through the space around the tubes, where it absorbs the latent heat in the steam. condensing it. The circulation should be rapid, so as to make the surface efficient. The condensed exhaust steam may be collected in a suitable settling chamber, or filtered to remove the grease, and then the clean hot-water, now freed from all injurious matter, may be returned to the boiler. All the condensed exhaust steam is then saved, and not only is the pure water obtained, but all the heat in it is saved as well; and that means probably eight per cent. of the heat in the exhaust steam. making just so much more available for sale.

In addition to using the heat in the exhaust steam, the system must have heat at times when no exhaust, or an insufficiency of exhaust, is available. Heat must then be supplied from another source, and this may be done in several ways. A live steam connection may be made to the exhaust pipe and live steam blown into and mixed with the exhaust; and in some instances this is done, but the method has objections that seem to make it impracticable. In order to prevent too much live steam from being blown through the heater and to waste, the live steam must be supplied through a re-

ducing valve, and a back-pressure valve is installed in the exhaust pipe to afford a pressure against which the reducing valve can work, thus causing the engine to work under a back-pressure. Then, too, the live steam so used becomes mixed with the greasy exhaust, and not only must be pumped back to the boiler before it can be used over again, but must be purified as well. All this calls for extra care and attention.

Another method for supplying extra heat, in use in some places, is to circulate the water through an ordinary boiler, and thus heat the water in a hot-water boiler direct from the fire. This means that at least two boilers, or two sets of boilers, must be kept going; one set must keep steam to drive the pump used for circulating the water, and the other set heat the water, so an unnecessary number of fires must be kept going. The regular boilers and furnaces must cool down somewhat, and the extra boiler and furnaces be heated up; in the latter, instead of the boiler being at some 333 or 340 degrees, the boiler is at a temperature of 200 degrees, or less. This means that the furnace gases are apt to be chilled, and an imperfect combustion will result. From this comes more smoke and soot, and a loss of efficiency in general; and this in addition to the loss of efficiency due to the cooling and idleness of the regular boilers. It is a well-known fact that the best results are obtained from fuel under a boiler that is in constant use. Therefore the regular boilers should be kept hot as much as possible, and separate hot-water boilers should not be necessary whenever the plant is a little short of exhaust steam. Then, too, extra boilers require extra space in the station and a heavy added first cost.

The way, then, to add heat to the system, aside from that furnished by the exhaust steam, is to use steam drawn from the regular boiler plant and used in a separate heater; one similar to, but, of course, not so large as, the exhaust heater. This heater should be set above the boilers, so that the water of condensation will return to the boilers by gravity and at as high a temperature and with as little loss by radiation as possible. A separate heater permits the use of the full amount of heat in the steam without the possibility of wasting any steam. This condensation is kept absolutely free from oil or other impurities, and is returned to the boiler, saving the need of filtering it and of all power required to feed it into the boiler. This, I believe, is the most efficient means of supplying such extra heat as is required. By its means, in extreme blizzard weather, the full benefit of the exhaust may be obtained with no back pressure; and the water can be raised to a point above that of the exhaust, if necessary, in a far cheaper manner than by carrying back pressure to get such results. The boilers are also regularly under heat, the furnaces always hot, etc. Thus, in the ideal system we shall have a separate heater, for heating the water in time of insufficiency or absence of exhaust steam, set in series with the exhaust heaters with by-passes around each of them so that either may be cut out of service if so desired.

With means provided for heating the water, we can now consider means of circulating it from the central station to the customers. In some instances duplex or single-acting reciprocating, plunger pumps have been used. As is well-known, a steam pump uses steam non-expansively, and consequently is perhaps the least efficient steam motor in the market to-

day. In some instances, as much as 125 pounds of steam per horse-power hour are required. In addition to inefficiency, pistons must be packed and cared for, valves must be looked after and renewed. Each stroke gives a pulsation to the entire system, the noise from which is apt to prove annoying to the patrons. This type of pump also requires considerable floor space, and is expensive in its first cost. The pump for use with a hot-water heating system must be more simple, more durable, and by far more efficient. The centrifugal or blower type of pump best meets the requirements. For moving large volumes of water against moderate heads, no type of pump is so efficient as this. In addition to being much more efficient from the hydraulic standpoint, this pump may be driven from the most economical source of power available. If a line shaft be run continuously, the pump can be belted from that, and the horse-power required be that produced from twenty-six or thirty pounds of steam per horse-power hour. If current be available, one pump may he driven by a directconnected motor and the duplicate unit may be driven by a small, direct-connected, highspeed engine; thus, in any event, using the minimum power for the maximum result. These centrifugal pumps give no pulsation whatever. They turn out a steady, even, continuous stream. There are no valves at all to trouble, and there is nothing about them to get out of order, In fact, there is merely a rotating disk in a chamber. There is nothing about them to break or wear out.

This completes, then, the station equipment required; exhaust heater, live-steam heater, and pump for circulation.

We may now consider the system of distribution, or piping of the territory to be covered by the system. It is quite true that, to a considerable extent, the laws that govern electrical circulation hold for water circulation, and the electrical terms employed may be used with advantage to describe the water circuit.

The houses may be put in multiple; this requiring, of course, two mains wherever customers are obtained. One pipe would be the outbound pipe, and the other for the return water. While at first glance this would seem to answer, yet it is evident that the further out from the station the customer happens to be, the less pressure there is between the two mains, and therefore less tendency to circulate. In other words, the houses near the stations short-circuit the houses far away; and in order to overcome this tendency to short circuit, the taps or service cocks must be made larger toward the ends of the line. Thermostats, too, have to be called into play in each house, in order to assist in equalizing a badly-designed circuit by cutting in resistance in short circuits. To overcome the tendency of the last house on the line to cease circulating, the station pumps must be operated under enormous pressures, even sixty and seventy-five pounds being used in some instances. Such heavy pressures require immense pumps.

The two-pipe system, in certain cases, and properly laid out, is an excellent device. The objection to it is that two pipes of a given size give double the radiating surface that one would give. Two pipes cost nearly double what one would cost. There are twice the fittings and joints to trouble, and twice the provision for expansion must be made. A single-pipe circuit, then, offers the solution to these difficulties. One pipe run in a circuit will answer the purpose of two. The houses may

be shunted off from the pipe, taking advantage, wherever possible, of whatever tendency there may be to circulate, due to gravity. In this system, there will be required one mediumsized main for each circuit. It can be put in for a minimum expense as to cost of pipe, insulation, and labor for laying. This main would be free of obstructions and of low resistance, consequently it would require a minimum power to produce a rapid circulation, which will insure that the load can be carried with small drop. If the main be proportioned properly to the load, with a certain speed of circulation, there can be obtained any predetermined drop in temperature, which should be only twenty degrees Fahrenheit, or such a matter, thus putting the last on practically an even footing with the first. The service pipes need be only of medium size and but slightly more expensive to install than smaller ones and they will be cheaper to operate, because of less resistance and some aid from gravity, thus reducing the circulating power and producing an economy. With this system of piping, then, twice the territory can be covered with a given length of pipe, by using a shunt system, that can be covered with a multiple system and at a much less expense, and it will be far more economical as to the loss of heat by radiation than is the two-pipe system.

The system may be an "open" or a "closed" one. By an "open" system, I mean a system wherein the circuit at the station is open into a tank, and there is at that point no pressure. The water must, be pumped from the heaters into the out-bound mains and raised to the highest radiator, hence, flowing back through the return mains it runs into the tank. Thus, it is evident that the two-pipe plan must be used when the circuit has an open tank at the station. In other words, the pump not only has to circulate the water, but has to overcome the static head of the system. An enormous waste!

If the system were closed—that is, had no open spot in it-then the static head on both suction and discharge would be equal, and the only work the pump would have to do would be to overcome friction in the circuit; it would not have to lift any water at all. This would cut the pumping head down to less than twenty pounds, where in open circuits it is often as much as seventy-five pounds. It might be assumed that this power would not be a less at all, as the exhaust from this power-producing source would be used for heating purposes; but this power is called for twenty-four hours per day, and it is probable that the steam-producing agents in our plant have now enough during the peak of the electric load without added burden, and during a large portion of the time the exhaust from the electrical load is sufficient; so for a couple of hours, during the peak, it would distress us to produce this excessive power, and during a large portion of the twenty-four hours we should have to throw it away, as our electric load gives a sufficient amount. Any extra pumping required is a great detriment, instead of being merely unobjectionable or of no value.

In the electric station it is of great advantage to use storage batteries, charging them during the period of light load and using them to assist when the heavy load comes. Is there an analogous case in heating? The maximum exhaust is produced at the time of the peak; can this advantageously be saved and stored for use during the time of insufficiency of exhaust? It is evident that the load of a heat-

ing plant is limited only by the size of the electric station, as the lights required in any building will furnish only some twenty or twenty-five per cent. of the exhaust required for heating it. The proper size, therefore, for the heating system is such that in the usual winter weather it will require all the exhaust except a little during the peak.

Consider the two sides of the storage tank: First-Assume a ten per cent, loss of heat in circulation. To do this, it is necessary to have the medium move at a rate of from four to five hundred feet per minute. What size of tank would be required to hold sufficient water, with its stored heat to supply from three to five-inch, four to five-inch, or six-inch, mains running at this speed? It would necessarily be of immense size, expensive, occupying much room, and it would itself present a very large radiating surface, requiring extensive insulation, and would then lose much heat. Second -There would be only a little surplus exhaust during the peak to apply to heating the storage. In usual weather this would hardly be sufficient to care for the radiation of the tank alone. There would not be enough under any circumstances to justify the installation of a storage tank. Third—In blizzard weather there would be no surplus for storage. Fourth-In mild weather there would be no need of a storage tank, for there is then sufficient exhaust at all times. Even in the case of a plant without day load, I doubt the advisability of using a storage tank, because the stored water can be used but once, as its storage capacity is limited to the drop on the line of some twenty degrees Fahrenheit, because of the immense size required to make it of any actual value and because of its cost, etc., it cannot prove a paying investment.

In extreme cold weather, put on an extra fireman, or use a little better grade of coal, and use the live-steam heater to make up for the extra cold.

To get the best results, the equipment must be worked at its rated capacity in ordinary weather, and to its extreme capacity in the coldest weather, otherwise, the best efficiency is not obtained.

This about covers the principal requirements for an ideal system, the summary being as follows:

A hot-water system, using closed heaters to absorb the exhaust heat, with sufficient openings to allow all the exhaust to pass through without producing any back pressure, or capacity to condense it all.

A similar, smaller heater to help out this exhaust set above the boilers, that the condensation may be returned to the boilers by gravity. Save all condensation.

Centrifugal pumps, suitably driven, with a closed, one-pipe system of distribution, well insulated.

A load requiring about all the exhaust in medium winter weather, which gives a system wherein the maintenance, operation and investment are minimum, and the efficiency, reliability, simplicity, and satisfaction to all are maximum, making an ideal system.

# Electricity Kills Bacteria.

A cable dispatch from Berlin, June 3, says that an important discovery has been made at the hygienic institute of the University of Wurzburg, where it has been found that bacteria can be destroyed with electric currents.

## SERIES INCLOSED ALTERNATING ARC LIGHTING FOR STREET LIGHTING SERVICE.\*

BY WILLIAM LISPENARD ROBB, Hartford, Conn.

For a number of years previous to 1896 the arc-lamp and arc-light dynamos remained practically unchanged, and most of us were disposed to consider this class of apparatus as having practically reached the stage of final development. No class of electrical apparatus has, however, undergone more radical changes during the past four years than that used for arc lighting. These changes have been brought about by the consolidation of numerous small plants, making it advisable to supply large areas from a single central station, by the introduction of the inclosed-arc lamp and by the fact that the inclosed-arc lamp made possible the successful use of the alternating-current arc lamp.

The inclosed-arc lamp on constant-potential circuits has now been in successful operation for about four years. The series inclosed arc has been in equally successful operation for a period of two years. The superiority of the inclosed-arc lamp has been appreciated by the general public, both when applied to interior lighting and when applied to street lighting. This superiority is not due to a greater mean spherical candle-power, this being undoubtedly very much greater in the open arc than in the inclosed arc when both are supplied with the same amount of energy. The superiority is due, rather, to the greater constancy of the light and its better diffusion, and to the relatively greater life of the carbon and the consequent infrequent trimming of the lamps.

In all long-distance transmissions of electricity, and when large areas are supplied from a single advantageously located power plant, we must, at least in the present state of the art, generate and transmit alternating current. In general, it will, in my opinion, especially if the wires are underground, be found desirable to supply the current to the street lights from the same secondary mains that supply the current for commercial lighting and power. This means that where low-tension secondary mains are in a street, we should do our street lighting with constant-potential inclosed, alternating or direct-current arc lamps, the kind of lamp used depending on the kind of current used on the commercial circuits. There are, however, in all places, large areas in which the streets are lighted by arc lamps, and where there is no commercial lighting or power. These sections can be most economically lighted by series arc lamps.

Various methods of operating series arc lamps from alternating current generating systems have been suggested, and are now in successful operation. These systems may be grouped as follows:

First—Synchronous or induction motors can be used to drive a line shaft, from which are belted the series direct current arc dynamos that supply current to either open air or inclosed direct current series are lamps.

Second — Direct current series are dynamos can be direct connected to either synchronous or induction alternating current motors, and the dynamos used to supply current either to open or inclosed direct current series are lamps.

Third—The constant potential alternating

<sup>\*</sup> Read before the National Electric Light Association at its Twenty-third Convention held at Chicago, Ill., May 22-34, 1909.

current supplied by the generators can be transformed directly by rectifiers into a constant current direct current, and used to operate either series inclosed or open direct current arc lamps.

Fourth—Series alternating inclosed arc lamps can be connected in series, with a reactive coil across the constant potential alternating current circuit.

Fifth—The constant potential alternating current supplied by the generators can be transformed directly by constant current transformers into constant current, and used to operate series inclosed alternating current arc lamps.

I have not included in the possible systems that in which the series arc-lighting system is operated by its own steam plant, as it is practically the unanimous opinion that, with the present condition under which central stations operate, the best results are obtained when one kind of current is generated and this is transformed for the various kinds of service required,

The history of the electric-lighting industry during the past two years seems to have demonstrated that in practically all sections of this country it is possible to replace the open air arc with inclosed arc lamps, and give equal or better satisfaction when the same amount of energy is applied to each type of lamp. As the annual saving per lamp in trimming, carbons, inspection and maintenance of the lamps is approximately ten dollars, it would seem to place the open air arc out of consideration, and the question of street lighting system resolves itself into which of the above mentioned systems should be adopted for operating inclosed arc lamps.

The system of street lighting that will be found best for any given city undoubtedly depends largely upon local conditions. But there are unquestionably many cases where investigation will show that the adoption of the constant current transformer and the series alternating inclosed arc lamp will at present offer the best solution of the problem.

President Carnes kindly requested me to prepare a paper embodying the results of our experience with this system in Hartford, where constant current transformers have now been in use continuously for more than two years.

We are at present operating 804 street lights. Seven hundred of these are operated from constant current transformers on series alternating current circuits. The remaining lights are operated from a constant potential Edison three-wire system. Eight constant current transformers, each of 100-light capacity, are in use. Six of these have been installed in two transformer houses, at a distance from the central station, and are operated without any attendant.

The construction of the 100-light transformers is shown in Figs. 1 and 2. In transformers of smaller capacity there are but two coils, one fixed and one movable, as shown in Fig. 3.

Each transformer is enclosed in a cylindrical tank. The tanks were originally made of boiler iron riveted up. It proved impossible to keep tanks made in this way tight against the transil oil in which the transformer is immersed. The tanks are now made of cast-iron.

The core of the transformer is of the sheet type, with a large central vertical core rising the whole height of the tank. This central core is surrounded by primary and secondary coils, and the magnetic circuit is closed by return paths outside the coils. One of the prim-

aries is fixed at the bottom and the other at the top of the central core. The two secondaries are free to move up and down between the primary coils, and are so connected that when one falls the other rises. They may approach into contact with each other at the middle of the tank, or from this position one may rise toward the primary coil at the top, while the other falls toward the primary coil at the bottom. Connected with the chains by which they are balanced is a lever, which extends outwardly from the top of the oil tanks and carries, suspended from its outer end, an adjustable weight. The lever is supported on a hardened steel knife edge. The weight tends to force the two secondary coils respectively toward the two primary coils. When the transformer is in operation the currents induced in the secondary react upon those in the primary, and tend to force the coils apart. This force is balanced for the desired normal current by the adjustable weight outside of the tank. The 100-light transformers are arranged to operate two circuits of fifty lamps each. The circuits are connected upon the multicircuit principle first used with the Brush series dynamos. The transformer can be adjusted so as to give practically constant current from one-third load to full load. The regulation below one-third load is sufficient to prevent the current from rising to an extent that will endanger a single lamp if all the others should be cut out.

The first lamps were -trimmed every five days, but since adopting the caps now in use it has only been necessary during the long lighting hours of winter to trim once in six days. The trimming is taken care of by two trimmers, and from the results obtained we find that one trimmer with horse and wagon can easily take care of 500 lamps. This would make the annual cost of trimming per lamp, at the Hartford rate of wages, \$2.00 per lamp, as against \$8.00, as was the cost per lamp when the open-air arcs were used.

The cost of carbons per lamp per year is \$1.50 against \$5.84 previously paid for open air arcs.

The cost of inspection has remained unchanged.

The cost of inner globes now averages less than two globes per lamp per year, or about thirty cents per lamp. Both the breakage of outer globes and the repairs on the lamps have been considerably less, but the data accessible are not sufficient to permit me to state this saving exactly. The annual saving in trimming carbons, and repairs made by replacing the open-air arcs with inclosed arcs has undoubtedly been greater than \$10 per year per lamp. The service has been improved; the number of hours lights have been out has been reduced about 50 per cent. During the past six months the records show that out of 804 lamps, the "outages" amounted to 2.2 lamps out all the time. The service furnished by the inclosed arc lamps has been extremely satisfactory to the public and to the board of street commissioners having charge of the street lighting. This board in their last annual report just issued, took occasion to refer to the extremely satisfactory condition of the service, and made especial reference to the small amount of "out-

In most of the tables that have been given. showing the comparative expense of operating the inclosed and open-arc lamps, the breakage of the inner globes is usually stated as much larger than we have obtained in our actual experience. This, I believe, is due to the ex-

perience that the trimmers have gained, as the breakage has materially decreased during the past year. During the past month the rate at which cylinders have been renewed has been about eight-tenths of a cylinder per lamp per year. The smallness of the renewals is also in great part due to the fact that the cylinders are cleaned every time the lamps are trimmed,

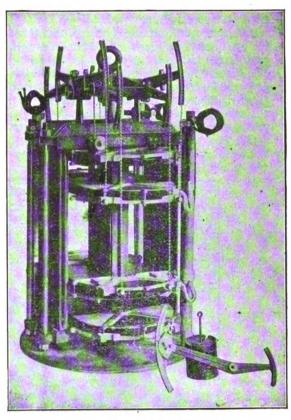

Fig. 1.—100-Light Constant-Current Transformer.

and consequently can be cleaned with a brush and hot water, and no acid is required for removing the deposit.

The success or failure, of the introduction of inclosed-arc lamps depend largely on whether the cylinders are kept clean. They should undoubtedly be cleaned every time the lamp is

Fig. 2.—Case of Constant-Current Transformer.

trimmed, and not at the lamps, but at the central station.

The transformers and arc lamps were made the subject of careful tests, and the results of these tests have been embodied in a paper already read by the author before the American Institute of Electrical Engineers.\* The aver-

<sup>\*</sup> Meeting held September, 1899.

age results obtained from two 100-light transformers are as follows:

Load.	Efficiency.	Power factor.
1	88.1	24%
1	92.3	44%
8	94.9	62%
Full.	96.1	78%

The rise in temperature of the oil in the transformer measured, at the top of the iron core where it is greatest, 39 degrees C. after twenty-four hours' run.

Under the usual conditions of street lighting the dynamos at all times carry at least 90 per cent. of the full load, and at this load the efficiency and power factor of the constant-current transformer alternating system are satisfactory. The power factor is approximately the same as that obtained with induction motors at the average load at which they are operated. The low power factor at fractional loads makes the use of a constant-current

any attendant. Although the voltage at the terminals of the primary of the transformer is subject to a variation of several per cent. during the street-lighting hours, the current supplied to the series lighting circuit is practically constant. The records that I have with me record the operation of transformers located in a sub-station about a mile from the central station. These transformers take their current from the feeders that supply the commercial lighting and power system. We have had no single interruption in the service due to the fact that the transformers are operated from transformer-houses, with no attendant in charge of them.

The lamps that have been used in Hartford are of the carbon feed type and differential. The power factors, as given in the above table, were measured on the primary side of the transformer, with differential lamps on the secondary. The power factor would be consid-

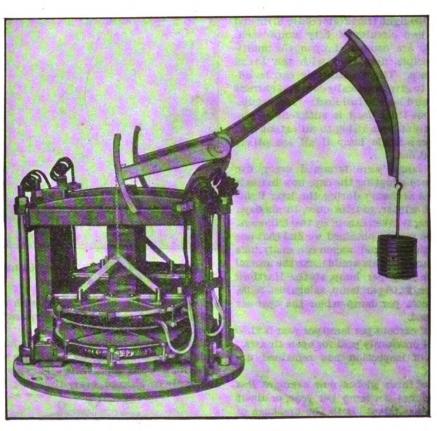

Fig. 3.—50-Light Constant-Current Transformer.

transformer undesirable when the conditions are such that the transformer is not operated at a large part of its rated full load.

It has been found in practice that the transformers can be maintained and operated successfully with little attention. At Hartford. six of the transformers have been operated during the entire past year from two outlying sub-stations. There is no attendant at either of the stations. The inspector of the district cuts on and off the lights at the proper time, and visits the sub-station once during the night. Each transformer is equipped with a recording Bristol ammeter, so that a complete record is kept of the time of cutting on and off the circuit, and of the time the inspector makes his nightly inspection, and of the working and adjustment of the transformer. We have a complete daily record of the operation of the transformers since their installation, and I have with me a large number of these records that demonstrate how perfect the regulation of the constant-current transformer is, even when operated from sub-stations without

erably increased if satisfactory shunt lamps were used. Lamps of this type, however, with which I have had the fortune to experiment, have not proved satisfactory when compare with the differential lamp, and it was considered that the differential lamp was a better one to use, even if its use reduced the power factor of the system several per cent.

The following brief comparison of the series inclosed alternating-current arc lighting from constant-current transformers with the other systems of series-inclosed arc lighting suggested in the earlier part of the paper, may prove interesting. In making the comparison between the different systems, I have assumed, and believe it to be true, that equally satisfactory results in street lighting can be obtained from the 6.6 ampere inclosed direct current, and the 7.5-ampere inclosed alternating-current arc lamps. The comparison is confined to these two lamps under full-load conditions, as in series street lighting this is the usual working condition.

First-Comparison of system using direct-

current arc dynamos, belted from a line shaft driven by motor.

Actual experience in the Hartford case showed a saving in power of 150 watts per lamp, when 400-watt alternating-current lamps supplied from constant-current transformers replaced nominal 1,200 candle-power open-arc lamps. This, assuming the value of power at the switchboard as one cent per kilowatt-hour, would mean an annual saving in the cost of power of six dollars per lamp per year in favor of the constant-current transformer system. The saving of space in the central station has been very considerable, the space occupied being not more than one-tenth as great as the space formerly occupied by the line shaft and arc-light dynamos. The repairs on shafting and belting are entirely eliminated and the maintenance and repairs on the constant-current transformers very materially less than the repairs and maintenance of the arc dynamos and motor, and the services of an attendant have been dispensed with.

Second—Comparison with system using direct current arc dynamos driven by induction motor.

The combined efficiency of the induction motor and series are generators is approximately 80 per cent. The power factor of the induction motor is 90 per cent. The efficiency of the transformer is 96 per cent, and the power factor of the entire system, 78 per cent. The number of watts supplied to the lamps is approximately the same. By the use of the alternating system there is consequently a saving in actual power and load on the engine of 18 per cent., and in apparent load, and consequently in the capacity of the generators, of about 10 per cent.

On a 1,000-light equipment one attendant would be required to look after the arc-light generators, whereas the amount of attendance required by the constant current transformers is apparently negligible. This makes possible the placing of the constant current transformers in a sub-station. This frequently greatly simplifies the wiring system. In the case of a central station operating 1,000 lights in half a dozen neighboring towns, careful estimates were recently made of the relative cost of the wiring system if the lamps were operated from motor-driven are dynamos placed in the central station, and if operated from constant current transformers placed in the transformer houses in various towns. There was found to be a saving in the first cost of the installation of the wiring system of \$11,000 in favor of the constant current transformer system. Constant current transformers take up only about half the space of the motor-driven dynamos; the initial cost of the transformer is much less than the cost of the motor-driven dynamo, and the repairs and maintenance are also less.

Third—Comparison with series alternating arc lamps, operated in series with a reactive coil.

If the reactive coil and arc circuits are placed directly across the bus-bars, they introduce the grounds on the series arc circuits on the general system, and also limit the series arc circuits to a comparatively small number of lights. This will, in general, make it advisable where this system is used to introduce step-up static transformers between the bus-bars and the series arc lighting circuits. These transformers serve the double purpose of removing the arc light grounds from the bus-bars, and also make it possible to increase the number of arc lights operated on each circuit. Other things being equal, it is of course preferable to have

the transformer and reactive coil combined in one piece of apparatus, as it is in the constantcurrent transformer.

If the reactive coil is installed with step-up transformers and is installed with sufficient capacity to protect the lambs at all loads between no load and full load, the advisability of adopting one of the alternating systems rather than the other will depend largely on the relative reliability of the lamps furnished with the two systems. The series differential alternating lamp has now stood the test of actual service for two years, and is able to fulfill the requirements of a satisfactory lamp. It is to be hoped that a shunt lamp will be made that will do the work equally satisfactorily, although it seems extremely doubtful if a shunt lamp can be made to work on series circuits as satisfactorily as a differential lamp. The use of the shunt lamp would mean a very material increase in the power factor of the alternating series are lighting systems.

Fourth—Comparison with system using series inclosed direct-current arc lamps, supplied with current from rectifiers.

In this country, up to the present time, it has been impossible to manufacture satisfactory rectifiers intended to operate on a frequency of sixty cycles. It is considered practicable, however, to make rectifiers that will operate at twenty-five cycles. Even if sixty-cycle rectifiers could be made to operate satisfactorily, it is doubtful if they could compete with the constant-current transformer, as in addition to the constant-current transformer, they would have complicated rectifying devices, and would require the services of an attendant.

With twenty-five cycles it is impossible to operate alternating-current arc lamps. The constant-current transformer system could therefore be used only in connection with frequency changers. Consequently, when central stations operate at low frequency, the introduction of rectifiers will be advantageous, the advantages of the rectifier over the system in which series arc dynamos are direct-driven by motors being in many respects the same as the advantages of the constant-current transformer over the same system.

I venture the prediction that in the near future in the great majority of the cases where alternating current is generated, if the frequency is sixty cycles to the second, the series are lighting will be by series inclosed alternating are lamps, and if the frequency is twenty-five cycles the series are lighting will be by direct-current inclosed are lamps, supplied by current from rectifiers.

It is to be hoped that this paper will serve to open up a discussion in which the merits and faults of the various systems of series are lighting will be fully brought out by those who have had actual experience with the different systems.

# Proposals Invited.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until June 12 for furnishing the New York Navy Yard with a quantity of motors. Blank proposals will be furnished upon application to the Navy Pay Office, New York City.

The Treasury Department is inviting sealed proposals until June 19 for installing an electric light and power plant, including engines, generators and switchboard, in the United States custom house building at St. Louis, Mo. Specifications and plans can be obtained upon

application to the Secretary of the Treasury or of the custodian of the building. Requests for plans and specifications must be accompanied by a check for \$10 as a guarantee that the plans will be returned to the department. The amount will be refunded on their receipt.

The Treasury Department is inviting sealed proposals until June 12 for installing a system of electric light wiring in the U. S. Public Building at Portland, Me. Plans and specifications can be obtained upon application to the custodian of the building.

# ELECTRIC TRAMWAYS IN LONDON.

[From our London Correspondent.]

It is contemplated that by July the electric tramways in West London will be opened for traffic. The London United Tramways Company has adopted a special car of superior design at a cost of about £1,000 each. The greater part of the system will be worked on the double trolley method, so as to avoid interference with the magnetic observatory appar atus by leakage to earth. A short length is to be operated on the conduit system. About 30 or 40 miles of way will be worked electrically within a month or two, but the company's enterprise does not end here for it has just applied to Parliament for power to construct over 17 miles of extensions to be worked by overhead trolley, between Acton and Hanwell in the western district. The generating station is being rapidly pushed forward at Chiswick, on the site of the old horse-car depôt. Here it is proposed to have ample car storage, and there is room for a power house of 5,000 hp. capacity. It goes without saying that in the construction of the power house the latest improvements will be introduced, for Mr. J. Clifton Robinson, whose name will be remembered in connection with the extensive trolley lines of Dublin, Bristol and Middlesbrough, is the leading spirit in the enterprise. The power house is a one-story building of brick and freestone 154 feet long x 106 feet wide, divided into engine and boiler room. The boiler room is 45 feet wide and consists of a steel frame structure in order to carry the heavy weights due to the coal storage bunkers (holding 500 tons), economizers, flue and water tanks, which are located on a floor above the boilers. This steel structure extends to the roof, and thus makes the boiler-room practically independent from the engine room.

The coal supply will be delivered from the ground level outside the building to the coal bunkers above the boilers by a noiseless gravity bucket type of conveyor, capable of handling 40 tons per hour. This conveyor will also remove the ashes, dumping them into a special ash bin from which they can be readily removed. An additional coal store of 2,000 tons capacity will be provided north of the boiler room. It is intended to deliver coal to the stores direct from the North & South-Western Junction Railway's depôt, about 700 feet distant from the boiler room, by means of a gravity bucket conveyor. Alongside the siding, and entirely below the surface, will be placed a receiving hopper with the necessary apparatus for the delivery of coal to the conveyor, thus enabling the coal to be handled automatically direct from the railway trucks, and to and from the company's coal stores and to the stoker hoppers.

The boiler room equipment will consist of eight horizontal water-tube boilers each hav-

ing a capacity of evaporating 8,250 lbs. of water per hour at a steam pressure of 160 lbs. Each boiler will be fed by a mechanical stoker of the "Coking" type, the coal being delivered to the stokers by weighing hoppers from the coal bunkers above the boilers, thus securing a record of the exact amount of fuel consumed by each boiler.

The economizer, located on the floor above the boiler room, will consist of 360 tubes in 36 sections, provided with motor-driven scraping and cleaning arrangements. Here also will be two water tanks of 6,000 gallons each.

The smoke stack is to be 10 feet clear inside diameter, and 200 feet in height above the foundations. This stack will be built of steel plates in rings, lap jointed and riveted, tapering upwards, and finished with an ornamental cap. It will be entirely self-supporting and lined inside with firebrick.

The engine room will contain one 25-ton overhead traveling crane traversing the length of the room. There will be three vertical cross-compound condensing 750 hp. engines, with cylinders 22 inches, 44 inches, and 42 stroke; three of them running at 90 revolutions per minute, and each of these having two kw. electric generators; the fourth engine, running at 94 revolutions per minute, will be direct coupled to a 500 kw. 3 phase, 5,000 volt generator, with a frequency of 25 cycles per second.

The lighting sets will consist of two 2-crank tandem compound engines, each directly coupled to a 75 kw. 500 volt generator, and running at 400 revolutions per minute.

The condensing apparatus will consist of surface condensers of the Admiralty type, each containing 3,200 square feet of cooling surface and located on the engine room floor. Each condenser will be supplied with a vertical cross-compound combined air and circulating pump, with steam cylinders 8 inches and 15 inches, and air and water cylinders 20 inches, double acting, all 15-inch stroke.

Two cooling towers will be erected for cooling the water for condensation, these being of the twin type arranged in two sections, having capacity to care for 4,000 hp., covering a ground space of 40 feet by 15 feet, and 38 feet high. The mats composing the cooling surface will be of galvanized iron wire netting, and a proper distributing system for the water over these mats will be provided. There will be two air propellers for each section of tower, operated at 160 revolutions per minute by a direct-connected electric motor, when giving maximum capacity; two vertical compound duplex boiler feed pumps, each of sufficient capacity, will feed all the boilers. The hotwell will consist of a cylinder 48 inches diameter and 96 inches long, the feed water for the hotwell being passed through two feed water filters to thoroughly extract all oil before passing to the boilers. An auxiliary feed water heater will be supplied having 520 square feet of heating surface for heating the feed water before passing it into the economizer, exhaust steam from the boiler feed pumps and other auxiliaries being available for this purpose.

One motor generator set, consisting of one 3-phase synchronous motor, having 500 kw. capacity at 5,000 volts, and direct connected to two 250 kw. 500 volt generators will be located in the engine room for converting from direct to alternating current and vice versa, for convenience on light loads and as a spare generating unit.

The switchboard of white marble two inches

thick, bolted to angle iron framing, will contain tengenerator panels, two lighting generator panels, one instrument panel, nine feeder panels, and also two 3-phase generator panels, and two 3-phase feeder panels, and will be supplied with the necessary instruments and switches.

The electrical current will be distributed over the whole of the company's system by lead-covered, paper-insulated cables, drawn into cement-lined, wrought-iron pipes laid under the foot paths of streets. As many as thirty of these cables radiate from the central power station at Chiswick, over one million feet of these pipes being required.

The London United system is almost entirely double track, and over the rails of each track will be located two trolley wires about 21 feet in height from the ground, the two inside wires being inter-connected and forming the neutral. The overhead lines will be divided into half-mile sections, and in order to meet the Board of Trade requirements, each mileand-a-half of the line being supplied by an independent feeder running direct from the power station, the neutral return also being reinforced for each section of a mile-and-ahalf by a separate feeder.

A section of the line furthest from the center of the system, about eight miles in length, will be operated from a sub-station. This substation will be fed from the central power station through duplicate three-core, lead-covered, paper-insulated cables, power being transmitted at 5,000 volts on the three-phase system. The sub-station will have a switch board consisting of two 3-phase high tension feeder panels, six transformer panels, four rotary converter panels, four feeder panels, and two instrument panels, the switchboard being similar in design and finish to that in the main generating station. In the sub-station will be provided seven static transformers (one being an extra), each of 150 kw. capacity at 25 cycles per second, transforming 5,000 volts to approximately 350 volts. The cooling air for these transformers will be supplied by an electric motor directly connected to a suitable fan. Four rotary converters will also be supplied each of 200 kw. capacity, and 6-pole machines running at 500 revolutions per minute, and delivering current at 550 volts, for supplying sections of the line radiating beyond six miles from the central power station at Chiswick.

The sub-station is designed generally on the lines of that already existing at Stockton, but there is a difference in the electric connections, owing to the rotary converters feeding into a three-wire system. These machines will be electrically connected, so as to act both as rotary converters and as balancers: that is, in case one side of the three-wire system be over-loaded, the rotary converter acting on the opposite side of the system will act as a motor, and thus assist the over-loaded machine.

The rolling stock to be used over the whole system will practically be a duplicate of that in use on Tees side. The usefulness of single units of traffic, in the shape of 8-wheel bogie cars, to meet and successfully handle large volumes of traffic has been most satisfactorily demonstrated at Stockton, Middlesbrough and Thornaby.

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended June 2:

Amsterdam, 2 cases, \$59; Antwerp, 6 cases,

\$1,486; Argentine Republic, 4 cases, \$354; 27 packages, \$1,487; Barcelona, 21 packages, \$4,-475; Berlin, 1 case, \$5; Brazil 24 packages, \$1,-092; 1 case, \$80; Breslau, 1 case, \$16; Bristol, 124 packages, \$5,820; British Guiana, 22 packages, \$1,015; British Possessions in Africa, 18 cases, \$1,313: British West Indies, 14 packages, \$278; Brussels, 2 cases, \$450; Central America, 29 cases, \$912; Cuba, 23 boxes, \$15,100; Genoa, 5 cases, \$2,119; 1 box, \$20; Glasgow, 29 cases, \$6,025; Gyon, 10 cases, \$288: Hamburg, 157 packages, \$22,086; Havre, 244 packages, \$15,852; Hayti, 2 cases, \$35: Lisbon, 2 cases, \$396; Liverpool, 29 packages, \$5,000; 16 cases, \$273; London, 151 cases, \$37,291:154 packages, \$7,205: 6 boxes, \$124; Margate, 3 cases, \$5,367; Mexico, 47 packages, \$1,349; Naples, 26 cases, \$7,400; New Foundland, 50 packages, \$327; Nova Scotia, 1 package, \$52; Peru, 8 packages, \$284; Porto Rico, 2 packages, \$22: Southampton, 4 cases, \$44: Vienna, 2 cases, \$21: Zurich, 2 cases, \$25.

## PERSONAL MENTION.

Mr. Fred. Kenny of Harrisburg. Pa., has been elected superintendent of the Steelton Electric Light & Power Com pany.

Mr. Carl Hering. President of the American Institute of Electrical Engineers, sailed for Europe last, Saturday. He is a member of the Jury of Awards in the Electrical Department of the Paris Exposition, and will be in Paris for three months or more.

Prof. Rowe of the electrical department of the University of Colorado has received a year's leave of absence, and at the close of the commencement exercises will ge to Schenectady, N. Y., where he is to occupy a position with the General Electric Company.

Mr. J. A. Leonard, formerly engineer of the Hudson River Power Transmission Company at Mechanicsville, N.Y., has accepted a similar position with the Kane Falls Electric Company.

# INCORPORATIONS.

The Maumee Valley Electric Company, Toledo, O. Capital stock, \$100,000.

The Paris Electric Light Company, Limited, Toronto, Ont. Capital stock, \$20,000.

The Carteret Electric Light & Power Company, Carteret, N. J.-to heat and light by electricity and to carry passengers. Capital stock, \$20,000. Incorporators: Quinn, Jr., of Carteret, William J. Leary, Elizabeth, and Walter K. Whittaker, Sewaren.

The Fraley Electro-Therapeutic Company, Atlantic City, N. J.—tc deal in electrical appliances. Capital stock, \$100,000, Incorporators: H. B. Cook, E. A. Hill, A. A. Redfield, all of Atlantic City.

The Electro-Magnetic Brake Company, Union, N. Y .- to manufacture an electric brake for electric elevators, etc. Capital stock, \$50,000. Incorporators: Fiehm, H. C. Steinhoff, L. A. Menegaux, J. S. Darling, T. R. Rabone.

# ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS. at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents. Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL. Nos. 302-304. Broadway. New York City. N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon p ment of ten cents. When ordering give name, date and title

# THE TELEPHONE WORLD.

# To be the Bell Company's Rival.

(From the New York Commercial.)

The Western Union Telegraph Company will engage in the telephone business on a vast scale and tackle its great rival, the American Bell Telephone Company, on its own ground. The first admission that such a thing is to be done came from one of the leading directors of the Western Union Telegraph Company. It has been kept a profound secret thus far, so as to give the Western Union an opportunity to float the necessary securities for prosecuting the war, and in order not to allow its rival any chance for retreaching itself.

It is this coming fight that led the Western Union to authorize the issue of \$20,000,000 new 4½ per cent. bondr, and, curiously enough, the directors intended at first to issue only \$10,000,000, and within a few days changed their minds and made it \$20,000,000. A little more than one-half of the first \$10,000,000 will be needed for retiring the old debentures.

At the time these bonds were authorized the officials of the company denied that they intended to go into the telephone business, and they have publicly stuck to this statement ever since. They declare that the new bonds will be needed largely for replacing old lines and poles.

There is some truth in this, but orders have gone out to string large amounts of copper wire particularly adapted to the telephone business between leading cities. The inference is that the first telephone lines to be established by the Western Union will be long distance ones. At the same time the Western Union has the facilities for establishing a vast network of local lines throughout the United States, and it will be a simple matter to attach telephones to the existing wires, and use them either for telephone or telegraph purposes.

It was learned that the part of the Western Union's business, as well as that of the Postal Telegraph Company which has suffered most is the private line service. The Bell Telephone Company, it is said, by means of its long distance service has absorbed three fourths of this entire business, which is immensely profitable, and the Western Union has felt the loss severely. If necessary, the Western Union will install telephones in all parts of the country and make a specialty of local business as well as long distance.

This is only one side of a great warfare, which is fast developing, and which bids fair to cause disaster to some of the contending companies. The Bell Telephone Company is beset, on the other hand, by the Telephone, Telegraph & Cabbe Company of America, a \$30,000,000 company, which is backed by such men as Martin Maloney, of Philadelphia, and John Jacob Astor, of New York, and is supposed to have the support of the Whitney syndicate.

This young telephone company is reaching out in all directions, and it has already secured enough of the local companies throughout the United States to seriously threaten the business of the Bell Company. It struck a body blow when it absorbed the Erie Telephone & Telegraph Company.

The Home Telephone Company of North Tonawanda, N.Y., has been incorporated with \$100,000 capital. Judge Albert R. Smith is president of the new company. This is the concern which was lately given a franchise to construct a system in North Tonawanda. The poles and wire have been ordered and work on the construction of the new line will be started within two weeks. The new company will sell 50 per cent. of its stock to local subscribers, and the balance of stock will be held by the Rawson Electrical people and Niagara Falls financial men. At the present time this independent company has franchises in Niagara Falls and North Tonawanda, and has applied for a franchise in Lockport. With a system constructed in these three cities the officials believe that they will make it quite warm for the Bell concern.

The telephone line between Richmond, Ky., and Irvine has been completed. The line is 25 miles long, and connects with the villages of Moberley, Waco. College Hill, Brassfield, Speedwell, Panola, Rice's Station and Logston's Store. The line will be extended to Clay City, Powell County, in the

The telephone companies at Fort Dodge, Ia., and Boone, have signed a contract for the construction of a copper return circuit toll line between Des Moines and Fort Dodge. Des Moines, Boone and Fort Dodge will be the only toll stations on the new line.

At the annual meeting of the La Crosse (Wis.) Telephone Company the following officers were elected: President, I. H. Moulton; vice-president, W. W. Cargill; secretary and treasurer, William Lohmiller.

The Diller Telephone Company organized at Diller, Neb. about a year ago, has made connection with the Fairbury Telephone Company of the same place.

## Knickerbocker Telephone Company Not Violating Law.

In a joint resolution passed by the Municipal Assembly on May 8 information was requested as to the alleged installment of poles and lines by the Knickerbocker Telephone Company in this city without grant or franchise. The resolution was sent to the mayor and allowed to become operative without his signature.

President W. H. Eckert, of the Knickerbocker Company, was seen recently concerning the resolution. He said that the company was formed under the transportation laws of the State, telegraph section, which permitted the company to conduct a telephone and telegraph business in the city on fulfilling police regulations, which require permits from the department of buildings, lighting and supplies, and the department of highways.

President Eckert stated that these conditions have been fulfilled in every detail, and exhibited permits from the departments mentioned to substantiate his statement. He declared that by the law under which the company was established it was not necessary to secure a grant or franchise from the Municipal Assembly. He said:

"It would seem rather weak on our part to go on estab-

"It would seem rather weak on our part to go on establishing our plant if we did not have authority. We have consulted our attorneys, and find that we have in every way fulfilled the letter of the law."

It is announced that the negotiations of the promoters of the Illinois Telephone & Telegraph Company have been broken off, and that a great conduit scheme has been taken up by the capitalists interested. The Philadelphia syndicate, according to a Chicago paper, refused to purchase the Illinois Company's franchise at terms satisfactory to the latter. An agent of the Independent Telephone Company has been in Chicago for several days looking over the plant of the local company, but the officials say he wanted the property at bargain-counter figures, and he returned to Philadelphia without investing in the new telephone enterprise. original promoters of the Illinois Company will probably abandon the telephone scheme, and go into the conduit business. They have secured additional capital, and in a week or ten days will begin again the construction of their conduits. In time an ordinance will be presented to the city council asking for the privilege of renting space in the company's conduits to electric lighting, telegraph, gas, and other companies using underground space.

An independent telephone company is endeavoring to gain a foothold in Louisville. Ky. Subscribers who will become members of the new exchange are being requested to sign papers, and armed with these the petition for the new concern. The rates of the rival company will be greatly reduced and a telephone war will result in all probability, if it gets a start. Since the action of the telephone exchange in putting in pay stations at all drug stores and in restricting persons to the use of their own telephones generally, there has been much dissatisfaction expressed among the patrons, and the new company will have easy sailing with a number of people in that city.

The Harrisburg, Pa., "Independent" is authority for the statement that the sentiment in favor of a competitive telephone system in Harrisburg continues to grow. It adds that in spite of the efforts of certain officials to dragoon councilmen into the support of the Bell telephone monopoly, the prospects of the passage of the ordinance granting a franchise to the Harrisburg Telegraph & Telephone Company grow brighter day by day. The business element of the city is wide awake to the importance of the matter and is making its influence felt.

The independent telephone movement is making rapid progress in Central New York, as is indicated by the plans of the Rochester Telephone Company for controlling all the territory within a radius of 40 miles of that city. Orders have been given to build 1,000 miles of lines. The capitalists back of this company are the ones who have applied for a franchise in Buffalo, and their plan is to build a connecting link between the two cities. It is understood that they are working in harmony with the Telephone, Telegraph & Cable Company of America, and it is likely that the up-State companies will be brought into the general group which is fighting the Bell Telephone Company.

The Cumberland Telephone & Telegraph Company of Louisville, Ky., has rescinded its recent order prohibiting the use of telephones by any other than the actual subscriber unless the subscriber himself made the call and authorized the use of his 'bhone.

Omro, Wis., has refused a franchise to the Wisconsin Telephone Company to operate an exchange. The Wolf River Telephone Company operates in the village.

# J. E. Keelyn's Liabilities.

James E. Keelyn, formerly president of the Western Telephone Construction Company of Chicago, has filed a petition in bankruptcy in the United States Court. His liabilities amount to \$523,175, while his assets are figured at \$71,797. Mr. Keelyn held stock in many companies and his contingent liabilities upon his holdings, which form a large portion of the scheduled indebtedness, are as follows: Western Telephone Construction Company, \$97,500; American Hardware Manufacturing Company, \$38,500; Wisconsin Valley Telephone Company of Wisconsin, \$25,000; Chippewa Falls Telephone Company of Wisconsin, \$25,000; Chequamegon Telephone Company, Ashland, Wis., \$50,000; W. Newton Smith, Tarboro, N. C., \$10,000

The Buffalo (N. Y.) "Courier" says: "If the board of aldermen should prove stubborn and refuse to grant a franchise to the Buffalo Telephone Company, the new corporation now getting subscribers every day in Buffalo, the time may soon come when the officers of the company will proceed to lay conduits and wires in the streets w thout asking permission of the common council."

A dispatch from La Crosse, Wis., states that the West Salem Telephone Company of West Salem, Wis., organized in opposition to the I'eli interests, has been incorporated. The incorporators are Wm. Lohmiller, J. George Schweizer and C. H. Schweizer, all of La Crosse. The new company expects to have a local independent exchange in operation in West Salem within 60 days.

The Henry County Telephone Company, with headquarters at New London. Ia., has a line to connect with Mt. Union on the north in course of construction. When this line is completed there will only be two townships in the county without a telephone line, Jackson and Trenton.

The Farr Telephone & Construction Supply Company, 857 Dearborn St., Chicago, is becoming well known in every State in the Union. The good reputation it has gained during the past six years has placed it as one of the most reliable and successful business houses in the country. It manufactures everything in the telephone line.

It is rumored that the Hudson River Telephone Company will absorb the Troy (N. Y.) Telegraph & Telephone Company. The Hudson River Telephone Company is capitalized at \$2,000,000, and the other at \$250,000.

The Inland Telephone & Telegraph Company, of Spokane, Wash., will begin work in a few days on a new line from Coulee (ity in Grand Coulee, to Waterville, Douglas County, Wash., in the Big Bend country. This new line will be 45 miles long.

A telephone Company formed in Matagorda County, Tex., has had the route surveyed between Bay City and Old Matagorda, Tex., and will build a telephone line between the two places. The distance is 20 miles.

The Central Union Telephone Company of Findlay, O., is rebuilding its telephone plant and when completed it will be the finest telephone system in the State. The improvements being made will cost \$50,000.

The Columbia Telephone Line is being extended from Elizabethtown to Bellaire, Pa., on the Cornwall & Lebanon Railway, thus to connect Bellaire with Lebanon.

The lower House of the Massachusetts Legislature refused to place telephones and telegraphs under State supervision.

# TELEPHONE INCORPORATIONS.

The South Suburban Telegraph and Telephone Company of New York—to carry on a general telephone business. Capital stock \$250,000.

The Greenbrier & Organ Cleve Telephone Company, Ronceverte, W. Va. Capital stock \$50,000. Incorporators: M. A. Gates, J. H. Crawford, R. A. Level, B. F. Mann, A. E. Johnson, all of Ronceverte.

The Wilton Telephone Company, Wilton, N. H. — to construct and operate a telephone system. Capital stock, \$2,000. Incorporators: G. F. Bales, C. E. Higgin, W. I. Durgin, J. F. Frye, H. L. Emerson, all of Wilton.

The Deshler Telephone Company, Deshler, O.—to construct and operate a telephone system. Capital stock \$10,000. Incorporators: F. D. Prentis, O. Higgins, H. C. Meeker, J. C. H. Elder, S. Cottingdam.

The Roane County Telephone Company, Kingston, Tenn. Capital stock, \$2,500. Incorporators: J. A. Erwin, J. E. George, T. L. Peterman, T. A. Wright, G. M. Peterman, G. W. Cooper all of Kingston.

# GENERAL NEWS.

# What is Going On in the Electrical World.

#### LIGHTING.

Akron, O.—The Nerthern Ohio Traction Company will erect an electric light plant to cost about \$100,000. H. A. Everett, president, 2573 Euclid avenue, Cleve-

Antioch, Ill.—The city council is discussing th question of building an electric light plant.

Atlanta, Ga.—An ordinance granting the Atlanta Railway & Power Company the use of the streets for an electric lighting system to cost about \$450,000, for both public and private use, was adopted recently by the council. E. Woodluff is president.

Bismarck, N. D.-H. C. Rubd has secured the contract to erect a new electric light plant for the Hughes

Colina, O —The citizens recently voted in favor of putting in an electric light plant and to issue \$25,000 bonds to pay for it.

Chattanoogs, Tenn.—The power house of the electric light plant here was partially destroyed by fire a short time ago, entailing a loss of about \$10,000.

Chicago, Ill.—Half a million dollars is to be expended by Swift & Co. in instituting a new electric light plant to serve their entire holdings at the stock

Clarendon, Ark.-The Clarendon Electric Light & Ice Company, with a capital of \$10,000, was recently in-corporated here for the purpose of erecting an electric light and ice plant. J. S. Thomas is president.

Cloverport, Ky.—This city is prepared to grant a franchise for the construction of an electric light plant. Address T. C. Tousey, clerk.

Fiskdale, Mass.—Mr. Sprague, an electrician from Boston, has been surveying the land here and making arrangements for the electric lights.

Gallatin, Tenn.-This place is to have electric lights in a short time.

Greenspring, O.—The citizens of this place are agitating the question of erecting an electric light plant.

Hallettaville, Tex.—Bids will be received until June 13 for furnishing a 60 kilowatt generator. Address J. W. Hawkins, city secretary.

Hammond, Iad.—The municipal electric light plant

of West Hammond was totally destroyed by fire a short time ago.

Heyworth, Itl.—A Chicago concern is figuring on installing an electric light plant at this place.

Houston, Tex.—J. O'Bierne has been awarded the contract to erect the municipal electric light plant in this city for \$99.750.

Kalama, Wash.—H. M. Stevens and W.F. Yeck, who are operating the Darnell mine, have made application to the city council for a franchise to operate an electric light plant here.

Montgomery, Ala.-The city council has instructed the city engineer to investigate the advisability of the erection of a municipal electric light plant.

Morrisburg, Out.—A by-law to authorize the council of the corporation of this village to acquire water privileges from the Dominion Government to construct electric light and power works and borrow \$250,000, for such purposes, by issuing debentures, was voted on here a short time ago, resulting in a large majority in favor of the by-law.

Nashville, Tenn.—This city will hold an election on lovember 6 to decide the issuance of \$150,000 of bon's or the erection of a municipal electric lighting plant. for the erection of a J. M. Head, mayor.

Neoga, Ill.—The town authorities are discussing the question of building a municipal electric lighting

Salem, Ore.—The city council has granted Franklin R Auson a franchise to establish an electric light and steam heating plant here.

Shakopee, Minn.—This city has voted to expend \$12,000 for an electric light plant.

Shawano, Wis.—The city council has voted to erect

an electric light plant.

Sterling, Ill.—P. J. Jones was recently awarded the contract to build an addition to the electric light plant at this place.

Talladega, Ala.—This city will erect an electric light plant. Address the mayor. Vacaville, Cal.—The Yuba Electric Power Company -This city will erect an electric light

has filed with the board of supervisors of Solano an application for an electric light and power franchise in this place.

Waitsburg, Wash.-The electric light plant here is soon to be enlarged.

Waterville, N. Y.—At a recent meeting of the citizens a resolution was passed recommending that the board call a special election to allow the citizens to vote for an extra appropriation for more electric

Weiser, Idaho — George Nixon, of Spokane, has scured a franchise to put in an electric light plant at

#### STREET RAILWAYS.

Camden, N. J.—It is reported that the new managers may extend the Camden, Gloucester and Woodbury Electric Railway to Pitman Grove, Glassboro and Clay-

Catskill, N. Y.—A trolley railroad is contemplated between here and Albany, along the river, connecting this place, Athens, Coxsackie, New Baltimore, Coeymans and Albany.

Cameron, Mo. — J. Williams of Fountain district is prejecting the building of an electric street railway from this place to Kansas City.

Clifton, O.—There is talk of an electric line starting at Osborn and running through Yellow Springs and this place to Jamestown.

Dayton, O.—The Dayton & Northern Traction Company of this city was recently incorporated for \$450,000 by J. E. Lowes, J. E. Feight, E. Bimm and W. B. Gebhart for the purpose of building and operating an electric railway between here and Greenville through Brookville and Arcanum.

Elizabeth, N. J. - Henry H. Isham is the prime mover of a suburban trolley line to run through the eastern section of this city where there are now no trolley facilities.

Fairmont, W. Va—A company composed of capitalis's from this city and Wheeling basarranged for building an electric street railroad here. About \$100,000 has been subscribed.

Greenwich, Conn.-It is understood in railroad cir-Grenwich. Conn.—It is understood in railroad circles that the New Haven road will purchase the franchise held by Judge B. Jay Walsh of this place for an electric road, and will shortly commence the construction of a trolley that will run through here and consect with Stanford. nect with Stamford.

Lansing, Mich.—Hon. H. R. Pattengill of this city is interested in the proposed electric railway which is to to be built between this place, St. John's, Alma and St. Louis.

Lyons, N. Y.—Calvin Hotchkiss and James D. Bashford are the promoters of the Lyons & Sodus Point Electric Railroad which is to be built this summer.

Pittsburg, Pa.—Several trolley lines in this State will be consolidated so as to form a system of 80 miles between Fairchance and this city. The consolidated road will be used largely for coke traffic.

Pottsville, Pa.—The Pennsylvania Railroad Company has decided to build a trolley road from here to Prim-rose and beyond Minersville to Forestville, a distance of 12 miles.

Rochester, N. Y.—An electric railroad is to be built between this city and Buffalo. Work will be com-menced upon it about July 1.

Springfield, Mass — A plan is maturing which may result in the establishment of a continuous electric street railway system from this city to Palmer by way of Wilbraham.

Tacoms, Wash.-It is stated that bonds to the amount of \$1,000.000 have been floated for the building of the Seattle Tacoma interurban electric line which is to be about 32 miles in length. Judge Bucey is promoter and general manager.

Wapakoreta, O. — The commissioners of Auglaize County lately granted a franchise to F. S. Carpenter, L. M. Coe and J. Mayer, capitalists of Cleveland, to construct an electric railway through the county from Cridersville to this city, thence west to St. Mary's, New Bremen and Minster.

Whitby, Ont.—A company has been organized here for the purpose of building a local electric railway and also to generate electric power. The capital is placed at \$30,000.

# MANUFACTURING.

Chicsgo, Ill.—The Electromote Company was recently formed here to manufacture and deal in electrical devices, etc. W. Clyde Jones, Keene H. Addington and Curtis B. Camp are all interested in the concern

Saco, Me. — The Springfield Electrical Manufacturing Company was recently organized here for the purpose of manufacturing and dealing in electrical apparatus and supplies, with \$10,000 capital stock. The officers are: president, Herbert E. Bosworth; treasurer, Bentley C. Starr, both of Springfield.

# COMPANY MATTERS.

Altoons, Ps.—A new electric light, heat and power company has been organized here recently with \$1,000,000 capital stock.

Hartford, Conn.-Important improvements are under Hartford, Conn.—Important improvements are under consideration at the works of the Billings & Spencer Company. The increase of the company's business has made it necessary to colarge the plant by increasing the motive power. It is maintained that the power can be divided and distributed more economically among the several departments if electricity is used than is the case with the steam power as used at present.

Irwin, Pa — The Irwin Electric Light & Power Company, the Jeannette Electric Light Company and the Manor Electric Company have been sold to Greensburg capitalists, headed by E. E. Robbins and M. L. Painter, for \$175 000.

Johnstown, N. Y. - The Fulton County Gas & Electric Company, a new corporation with a capital of \$1,500,000, has absorbed all the gas and electric companies in this county, namely: The Johnstown & Gloversville Gas Company, capital \$130,000; the Johnstown Electric Light & Power Company, capital \$100,000; and the Gloversville Electric Company, capital \$75,000.

Key West, Fla.—The Key West Electric Company will install new machinery. J. P. Loflin, president, No. 26 Broad street, New York.

No. 26 Broad street, New York.

Syracuse, N. Y.—The board of directors of the Marvin Electric Drill Company, which manufactures electric rock percussion drills, has voted to sell its German patents to a large German manufacturing concern. The drill company has a plant at Canastota and a number of men from this city are stockholders.

New York City.—J. H. Bunnell & Company of this city, manufacturers of and dealers in telegraph instruments and other electrical supplies, has lately placed its patent business in charge of David E. Lain, patent attorney, of Middletown, N. Y.

St. Louis, Mo.—The Commercial Electrical Supply Company of this city has increased its capital stock from \$30,000 to \$60,000.

# POWER AND TRANSMISSION PLANTS.

Indian Orchard, Mass.-H. S. Anderson, of the Indian Orchard, Mass.—H. S. Anderson, of the United Electric Light Company, is starting a concern to utilize the water power of the Chicopee River below here, and this company will be known as the Bircham's Bend Power Company, which will be capitalized for \$100.000. This power can be transmitted to Chicopee by means of wires, and can be used for running engines in various manufactories. in various manufactories.

Knoxville, Tenn.-A bill has been introduced in Knoxville, Tenn.—A bill has been introduced in Congress by Representative Henry R. Gibson, to grant the Knoxville Power Company the right to dam the Tennessee River at or near this city. This bill may be passed in Congress at present session, and in that event the company will begin putting its scheme into effect next fall. R. W. Austin, one of the incorporators, recently said: "New York capitalists have agreed to put their money in the project just as soon as we perfect all arrangements. If the scheme goes through the plant will cost \$800,000."

Post Fells Idaho.—P. K. Neill is the presents of a

Post Falls, Idaho.—R. K. Neill is the promoter of a proposition to erect a \$500,000 electric power plant here to furnish power for the operation of the mines in the Coeur d'Alene country. Wires will be strung for 65 miles, or as far as the town of Burke, Idaho. By this plan some of the largest mines in the Coeur d'Alene will be operated by electricity.

Pughtown, Pa.—By damming French Creek, near here, power is to be secured for a plant for supplying electricity for commercial purposes in the French Creek and Schuylkill Valleys.

Rock Hill, S. C.—The Catawba Power Company was recently organized with W. G. Wylie of New York president. The company is capitalized at \$100,000, and will put in an electric plant on the Catawba River near here. The company will furnish light and power to the surrounding towns.

South Windham, Me.—A new electric power plant is to be established at Mallison Falls.

# MINES.

MINES.

Leadville, Col.—Another electric power plant has been projected to supply power for the Leadville mines. John J. Hill and E. P. Young of Denver have been locating ground and water rights on Upper Homestake Creek above Gold Park, Esgle County. Two lakes on the headwaters of Homestake Creek have been located, and part of the water rights taken up. Preliminary surveys were made by Ben L. Crees. His plan is to dam the water at the outlet of the two lakes, and thus form storage reservoirs for the volume of waters that pours into these lakes in the spring. The water will be conveyed in pipes to Go'd Park, where the power plant will be located. The electric current will be conducted to this place across the mountain, a distance of 12 miles in an air line.

# AUTOMOBILES.

Boston, Mass.—A company known as the Boston Woods Motor Vehicle Company will conduct a selling business in addition to its cab and delivery wagon service, and is understood to have made arrangements to vice, and is understood to have made arrangements to locate its central station on Eliot street. The plans of the company include the establishment of recbarging stations at convenient points through the suburbs, where electricity will be supplied to its own carriages or sold to electric vehicles of private ownership. It also gives promise of great things in the line of an electric express business for suburban collections, and is looking to the aventual establishment of a regard less than the control of the control of the stablishment of a regard less than the control of the stablishment of a regard less than the control of the stablishment of a regard less than the control of the stablishment of a regard less than the control of the stablishment of a regard less than the control of the stablishment of a regard less than the control of the stablishment looking to the eventual establishment of a special electric carriage service in connection with the railroad terminals.

Chattanooga. Tenn.—S W. D.vine, president of the Chattanooga Rapid Transit Company, is conducting negotiations with a view of organizing an electric motor vehicle company, for operating all manner of electrical vehicles 

It is the intention of the company its charter to put motor vehicles in any or all the counties.

Painesville, O.—The Painesville Automobile Company was organized here a short time ago with a capital stock of \$10,000.

# **ECTRICAI** SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 161@161c.; Lake, 161@161c.; cast-

A dividend of \$10 per share has has been declared on Calumet & Hecla Mining stock, payable June 28.

The business men of Worcester, Mass., will incorporate the Citizen's Telephone and Telegraph Company, capital \$330,000.

The Dyslestown & Willow Grove Trolley Company of Doylestown Pa., has

been transferred to a successor company for \$950,000

The Chicago City Railway Company has declared a dividend of 3 per cent., payable June 39. Books close June 15 and reopen June 21.

A dispatch from Altoons, Pa., states that a new electric light, heat and power company, with \$1,000,000 local capital, has been formed.

At a recent special meeting of the board of directors of the Metropolitan West Side Elevated Railway Company of Chicago, Clarence S. Day was elected a director.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 18(2,20; New York Electric Vehicle Transportation, 8(2,84), New England Transportation, 4(4,44); Gramophone, 35(4,46).

The capital stock of the Granville, Washington County, N. Y., Telephone Company has been increased from \$10,000 to \$30,000. The directors include Frank E. Hicks, W. A. Tenny, F. T. Pember, F. W. Hewitt and Frederick W. Allen.

It is reported in Elizabeth, N. J., that an attempt is being made by the North Jersey Traction Company and the stockholders of the Elizabeth City and Elizabeth and Plainfield Trolley Company to consolidate the three systems.

The railroad commissioners of Massachusetts have authorized the Union Street Railway Company of New Bedford to issue capital stock to the amount of \$150,000 in addition to its present capital of \$450,000, and also to issue mortgage bonds to the amount of \$50,000.

The report of the United Traction Company of Albany, N. Y., for the week ending May 24, shows receipts amounting to \$25,620.44 against \$20.983.79 for the same week last year. The gain on the Albany division is \$1,620.65 and on the Trey division \$1 416 69.

Stockholders of the Amalgamated Copper Company met on June 4 and re-elected the board of directors as follows:—Marcus Daly, H. H. Rogers, William Bockefeller, James S.illman, F. P. Olcott, Robert Bacon, A. R. Sauer and A. C. Burrage. No financial report was submitted.

The directors of the General Electric Company at their meeting on June 1 declared the regular quarterly dividend of  $1\frac{1}{2}$  per cent. on the common stock and a regular semi annual dividend of  $3\frac{1}{2}$  per cent. on the preferred stock. The common dividend is payable July 15 and the preferred July 31.

It is reported on good authority that the Electric Company of America has disposed of its two Long Island plants for \$1.000,000. The interests behind the reported purchase, it is said, are identified with the Consolidated Gas Company of New York, and the money is to be paid by the middle of of June.

It is understood that over 9) per cent. of each of the two classes of Welsbach Commercial stocks and 86 per cent. of Welsbach Light stock have been deposited under the plan to consolidate with the new Welsbach Company. Monday the latter notified the Provident Life & Trust Company of its election to purchase the stocks deposited under the plan.

The earnings of the Metropolitan Street Railway Company, New York, for May were \$1 283.428, as compared with \$1,221.115 in the corresponding month last year, a gain of \$59 313. From July 1 to May 31 earnings are set down at \$13,011,439, a gain of \$1.497,037. As yet no announcement has been made of the plan of the proposed new stock issue of the company.

Mr. Grant, receiver for the Forty second Street, Manhattanville and St. Nicholas Avenue Railroad. New York, recently filed with the clerk of the United States Circuit Court his report of the earnings and expenditures of the road for April. The cash receipts for the month were \$51,835 31, which, with a cash balance from March of \$18,815,12, brought the total up to \$70,650.43. The disbursements for the month footed up to \$48,168 85.

In connection with the recent sale of \$2,000,000 five per cent, collateral trust bonds of the Eric Telegraph & Telephone Company it is stated that the purchasers were Wilson & Stephens, who, with Toland Brothers & Co. and Townsend, Whalen & Co. of Philadelphia will shortly make a public offering at 1021 and interest. It is stated that nearly half of the above amount has already been privately sold to Philadelphia, Boston, and New York interests.

The reorganization committee of the General Electric Automobile Company, comprising G. M. Dodge, New York; George Tracy Rogers, J. S. Arndt, J. M. Butler and Thomas E. White, is about to issue a circular calling for an assessment of \$4 a share on the 59,000 shares of capital stock, payable in two installments of \$2 each. The company owes \$50,000, so that it all the shareholders pay up there will be \$150,000 left for working capital.

The extensive properties of the Elmira (N. Y.) Municipal Improvement Company, formerly owned by Col. D. C. Robinson, were recently sold by S. S. Taylor, the receiver, under foreclosure proceedings on the \$1,800,000 mortgage held by the Guaranty Trust Company of New York. The purchase was made by the reorganization committee for the New York Mutual Life Insurance Company. The industries will in the future be conducted by the Elmira Water and Light Company, which was lately incorporated. The sale covers among other things the Elmira Gase and Illuminating Company's plant, the electric light slant, and appropriate and the sale covers among other things the Elmira Gase. and Illuminating Company's plant, the electric light plant and property, and the traction company property.

A big deal in Southern street railway securities has just been closed, and by it A big deal in Southern street railway securities has just been closed, and by it the Mercantile Trust & Doposit Company of Baltimore, Md., secures \$2500,000 of the first consolidated bonds of the Atlanta Railway & Power Company, which is a consolidation of street railway and power properties at Atlanta. Ga., and \$1,000,000 of the first mortgage bonds of the Augusta Railway and Electric Company, which owns the street railway and lighting properties at Augusta, Georgia. Of the Atlanta purchase \$1,000,000 is subscribed to by prominent citizens of Atlanta, \$500,000 by the New York Security & Trust Company and the remaining \$1,000,000 will be retained by the Mercantile Trust and Daposit Company. The purchase of the Augusta bonds was made jointly with the New York Security & Trust Company.

It is announced that the Bergen Turnpike Company has sold its six miles of road from Hackensack, N. J., to the Hudson County line to representatives of the Consolidated Traction Company. It is now said that the Consolidated has been acquiring right of way from its line on the l'aterson Plank Road through Moonarchie and Little Ferry, from where it can reach Hackensack through the turnpike. The turnpike was offered to the Newark and Hackensack Company for \$69,000 and to Bergen County for \$49,000. It is capitalized at \$52,000 and is said to have been sold above par. It paid a \$4 dividend on each \$10 share last November and \$1 a share just before the sale. The corporation was chartered by the State in 1802, and has always been in the hands of Bergen County people. The road was originally eleven miles long to Hoboken, but the Hudson County end was sold to that county two years ago.

# EDITORIAL NOTES.

The Telephone Situation.

The present condition of telephone practice in this country appears to leave little to be desired except lower rates. For simplicity of construction and

durability of apparatus to meet present requirements the layman can scarcely imagine improvements of any particular importance.

There are no systems in the broad electrical field better adapted to meet the requirements of public service than our present telephone equipments.

The employment of some of the best engineering skill, and the use of unlimited capital for commercial exploitation, has brought rich financial returns from many directions, which in turn has enlisted an increased amount of capital to network our larger cities and villages with wires, and to connect them at a most astonishing rapidity.

By comparison with the service in foreign cities our systems are remarkably quick and efficient. They leave little to be desired as far as serviceability is concerned, and this has resulted in a growth limited only by the present tariffs; but the telephone electrician who has closely watched the development of telephone inventions during the last decade knows full well that the Bell monopoly and its allies have bought up and shelved practically all of the most important telephone improvements and have hidden them from the light of day, while many an important invention that contained the germ of radical improvements has been stifled for lack of a competitive independent market.

A lowering of rates by the Bell monopoly would have resulted in an increase of the number of subscribers in almost an arithmetical progression; for the telephone, like the necessities of life, is widely and constantly desired.

Up to the time the independent companies commenced to enter the field, only the larger business houses could afford to pay the high rates. After the formation of independent companies, and the inducements offered by competitive tariffs, we saw a wider and larger use of the telephone, and these independent plants were quickly working to their full capacity, and even at this early date, competition is making itself felt in no small measure, even in the country towns and smaller cities where former rates were practically prohibi-

tive. To-day we are commencing to see the isolated farmer in thinly settled districts enjoying its benefits, while even the smaller towns are now connected by independent trunk lines.

Telephony has been a business in which capital has had the most decided and substantial certainty of beneficial returns, considering the amount of capital invested.

The monopolistic benefits of concentration have been no better exemplified in any line of business than in this, while the public—well it was wholly dependent for reasonable tariffs on the good graces of the telephone management, but in no other line of business have good graces been so sadly lacking, for a policy of the greatest benefit to the greatest number has been wholly ignored by the Bell monopoly from the first.

Strongly intrenched behind iron-clad patents, and free street franchises, and practically in absolute control of the conduit systems in the larger cities, where their money owned the politicians (who prove false to the interests of their constituents), the Bell Company charged exorbitant rentals for inferior instruments, refused to adopt improved apparatus, simply because they were in a position to do so, and thus save the expenses of a change. Following the custom of bandits they said, "Hands up" to the people, and pursued a policy of "The public be damned," pay our extortions.

All high-handed procedure must finally have an end.

The independent telephone opposition is teaching its beneficial lessons.

The policy of a little good to the favored few is being changed into a great good to a large number.

A strictly monopolistic management is seldom decidedly progressive, for such a management finds it easier to use imperfect apparatus, and do a comparatively small business at an exorbitant profit, rather than to adopt improved means and do a large business at a relatively small tariff with a final larger profit.

Telephone trunk line charges are decidedly high even when compared with the telegraph.

We are told they are necessarily so, from other than monopolistic reasons. We are authoritatively taught by the Bell people that we have not yet learned to quadruplex our telephone lines, or use machine methods of transmission, and thus work the wires at a high rate of speed or to employ as poor a class of line construction and secure permanent and

desirable service; and here again is more misleading sophistry—another case where it is easier to charge higher rates for a small quota of business, rather than broaden out and make even more money by doing a larger business at a lower rate.

The telegraph company assumes the expense of a messenger service to collect its telegrams, and likewise it is to a like expense in delivery and in addition it furnishes the stationery, while in the long distance telephone service these expenses practically are lacking. It scarcely more than furnishes an operator to call up and plug in, and this operator looks after several customers at the same time, while its patrons are their own senders and receivers.

If the Bell Company has a high grade of line construction for long distance service, it is for reasons of utility; the same reasons that govern the telegraph companies in constructing heavy copper trunk lines, officials of both systems of communication having learned from experience that high grade construction is really the cheaper.

Our present toll line telephone rates are without valid reason excessively high, and here again independent telephone opposition will reap a reward and do the public a lasting benefit.

Inventors and the

At frequent intervals patents expire, which throws open to the investing pub-Investing Public. lie a certain branch of industry hitherto controlled

by possibly one company or a certain clique of wealthy men. Thus, some six years ago, a number of important Bell telephone patents ran out, which allowed of independent manufacturers entering this field.

Some two weeks ago a number of patents taken out by Mr. Thomas A. Edison on lighting and transmission appliances expired, which, although not fundamental, are of sufficient importance to warrant mentioning.

Three of the patents which have just expired referred to various details in the incandescent lamp. One made a vacuum of the bulb, a second covered the introducing of volatile carbon, or silican compound, which was supposed to decrease the resistance of the carbon in the bulb, while the third referred to details in exhausting the bulb and the providing of the lamps with nitrogen. Other patents which expired referred to details of dynamo construction, such as the well known Edison dynamo regular; movable commutator brushes with hand operated adjustment devices therefor, and that which claimed the connections with dynamo field magnet coils.

Referring to the effect the expiration of these patents would have in a commercial way upon the electrical world, Mr. Edison took occasion to deplore to a representative of the N. Y. "World" the inadequate protection afforded inventors in this country, and among other things said:

"It is all very true that these patents have expired. As to the effect it will have I can make no statement that would be clear or readily understood. All of these patents were in line with the general improvement of the electric light and the perfecting of the dynamo. They were what scientists call subsidiary pat-

"I deny that I have had any monopoly with them or with any patent I ever secured. An inventor has no show these days. The moment he invents something that is an epoch marker in the world of commerce or science, there will be pirates to spring up on all sides to contest his rights to his ideas. These pirates can readily get millions at their back. They go to the courts and enjoin the inventor from using his own creation. By the faulty system of United States courts these pirates are enabled to hold the inventor for ten, twelve or fourteen years from the use of his invention. Meanwhile the court allows them to proceed with the use of the same device, so there is no monopoly. The inventor always gets the worst of it in the courts, even though he may hold in his hand the patent from the United States Government."

After stating that he had expended \$1,000,000 trying to establish his claim to the incandescent lamp and only succeeded when the patent had but three years left to run, he continued:

"I am not saying this in a humor of complaint, for I can make money anyhow. But it is a miserable system we have in this country that cuts the poor man out of his invention. I know of several inventors who were poor. Their ideas would have made them millionaires, but they were kept poor by the pirates who were allowed to usurp their rights in the courts. This usurpation is particularly apt to result in the case of some great epoch-making patent. I could invent a new monkey-wrench which might go without infringement, but the moment I take certain forces and work out a moving picture for the first time in the history of the world like that produced by the kinetoscope, mark you how the pirates rise up and call it their own."

That there is considerable truth in what Mr. Edison states, namely, that inventors are frequently deprived of their just deserts, cannot be denied, but on the other hand, owing to a more or less defective patent system, a patent in this country may, by clever manipulation, be kept alive considerably longer than it should be in justice to the public, as, for instance, in the case of the Berliner patent. The apt saving, "what is one man's meat is another man's poison," would seem to apply in this case, so that we fear it will be some time before laws will be enacted that will please both the inventor and the investing public.

The Use of Wireless Telegraphy.

William Marconi, the wireless telegraphy expert, is again in this country after an absence of several months. The exact object

of his visit at this time has not been made public, but it is rumored that it relates in some way to proposed extensive experiments with a view to the adaptation of wireless telegraphy to commercial use.

That wireless telegraphy is coming more and more in use as a means of communication is generally acknowledged. For some time past experiments have been conducted with this method of signaling in New York harbor, at Newport News, Va., and at several other places. The results obtained have been exceedingly satisfactory, so much so that Brigadier General Greely, has ordered wireless telegraphy stations located in the harbor of San Francisco, in Porto Rico and in the Philippines.

But the United States Government is by no means the only one that has been examining into this comparatively new method of sending dispatches. Those of France, Germany, Italy and England have not been idle. According to Mr. Marconi the French navy now employs his system, while several of the German liners are equipped with wireless telegraphy apparatus, by means of which they not only announce their arrival at their European ports, but many miles from land receive bulletins of all the important news which had become known while they were at sea. The Italian navy also makes use of this system on a limited scale, while the English Admiralty is gradually introducing Mr. Marconi's system on all of its principal vessels. Referring in a recent interview to the use of wireless telegraphy in South Africa, Mr. Marconi is reported as saying: "It is used for communication between the cruisers and the Admiral at Delagoa Bay, and has proved successful for a distance of eighty miles, which is the best that can be done with the power to be had there."

When questioned as to the invention of Gen. Baden-Powell's brother, Signor Marconi said he had experienced some difficulty in procuring means for the elevation of the wire that is attached to the instruments, which should be raised about 100 feet above the instrument for telegraphing sixty miles. The problem had been solved by the invention of a system of kites by Baden-Powell, and this device had been of great service to him in his experiments

There are ten sets of instruments in use in Lord Robert's army, but owing to the great difficulty of communicating with the army, it has been impossible to learn much concerning the results obtained.

From the above it will be seen that the nearest wireless telegraphy has come to being made use of in a commercial way, is on a limited number of transatlantic steamers. For this purpose, and for signaling between war ships or army corps, it would seem well adapted, but there are several good reasons why it will not replace the existing method of commercial telegraphy, at least not for many years to come, if ever.

# Notes and Comments on Various Topics.

Ir is expected that no less than one thousand telephone men will meet in Cleveland this week to discuss ways and means of improving and extending the independent telephone ser-

THE annual convention of the Electric Storage Battery Company of Philadelphia was held last week at the Walton Hotel in that city. About forty delegates were present. Papers were read and discussions indulged in, while the entertainment feature consisted of planked shad dinners and excursions to various points of interest.

THE Metropolitan Street Railway Company of New York City will shortly operate storage battery cars on its Thirty-fourth street crosstown line. A number of the new cars have already been received, and all that remains to accomplish a complete change in the road is the replacing of the present light rails with heavier ones.

The second hearing before the Railroad Commissioners of Boston, Mass., on the matter of assessing the cost of building and maintaining the proposed electrical power attachment for opening and closing the Slade's Ferry drawbridge, will be held June 21.

THE Siemens & Halske Company has started a small electric lighting station in the European quarter of Pekin, which it is hoped will overcome the prejudice of the Chinese merchants, so that they, too, will become consumers.

In Bremerhaven, Germany, at the mouth of the Weser, has recently been erected a 150-ton electric pivoted derrick, which is the subject of a leading illustrated article in "Le Génie Civil." It is of T-shape, the fixed portion being an open steel structure reaching up to the elbows of the T, while the movable portion consists of a truss forming the arms, with a stem or core reaching to the ground and revolving inside of the fixed support. The derrick is made to rotate by means of an electric motor, of 26 horse-power, running at 550 revolu: tions per minute through the medium of an endless screw and three pairs of gears, by which the speed is so reduced that the derrick requires 7.2 minutes to make one complete turn. An electric carriage travels along one arm of the T, and at the end of the other there is a counter-weight. The derrick is 118 feet high.

ELECTRIC cars are now in operation on the principal streets of St. Johns, Newfoundland. The current which provides the power, as well as that for lighting, is generated nine miles from St. Johns. The physical characteristics of the region lend themselves admirably to the success of this enterprise. There is a chain of four connecting lakes, and from the outlet of the last runs a flume, which is built along a steep hillside for 3,300 feet, until it disappears into a tunnel cut 350 feet through a bluff of solid rock. At the end of the tunnel is a huge sluice box of timber to the bottom of which is fixed a steel tube. Through this the water drops 185 feet on a large water wheel in the power house, which sets the machinery in motion. The capacity of the plant is 1,600 horse power, but the flume is of sufficient capacity to drive another plant of like size. The current is transmitted from the power house to a sub-station in St. Johns at a pressure of 15,000

The formal opening of the American electrical section at the Paris Exposition took place on the afternoon of June 6, when Francis E. Drake, the director, handed the section over to Commissioner General Peck. A number of short speeches were made, and afterward a small party of invited guests examined the exhibits in the Salon of Honor.

A DISPATCH from Berlin states that the Council of that city has resolved that hereafter it will build, operate, and maintain all street car lines for the municipal account. The Grosslichterfelde has been built, and trial electric trains, making eighty to ninety kilometers hourly, are being run. Soon such trains will be introduced on several lines.

Two Japanese railway officials, Y. Sasaki, general manager of the Nankai Railroad, and K. Nishino, traffic manager of the Sanvo Line who have been making a tour of the world, recently inspected the Brooklyn Rapid Transit Company's system. They expressed themselves as pleased with the operation of the railroad, and as particularly impressed with electricity as a motive power. Mr. Sasaki, referring to his own country, said: "Most of our railways in Japan, were built by English Engineers. There is little electricity there.

Nearly all of the power is that of horse or steam. The Americans, we have noticed, are leaders in electric railways. Even in England and Scotland we saw that the electrical machinery was made by Americans and the maker's name on the machinery. Nothing can compare with electricity for city railroads."

THE Committee of Parliament, to whom the question of constructing a high speed electric railway between Manchester and Liverpool, in England, was referred, as outlined in our last issue, has reported against the project. It admits that "the mono-rail system when fully matured is likely to make an important contribution to the development of railway traffic at high speed." The principle involved is conceded to be good. But the committee was "not satisfied that a safe method of applying brakes to trains going at very high speed had been devised." Besides this, there was a "disregard

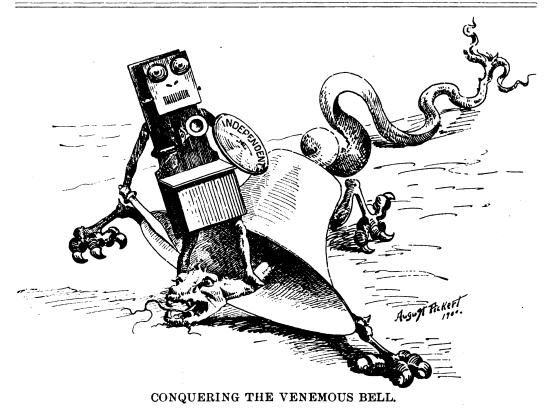

# Telephone Men in Council.

Great Gathering of Independents at Cleveland.

Judge James M. Thomas to Preside-Many Interesting Papers to be Read-Important Exhibits of Telephone Apparatus.

Thanks to the indefatigable work of Judge James M. Thomas, C. W. Wason and others everything is in readiness for the Fourth Annual Meeting of the Independent Telephone Association of the United States to be held in Cleveland from June 12 to 14.

The headquarters of the Association is in

of existing interests" in the route selected for the proposed railway. It would not serve the district between Manchester and Liverpool, though it would call upon it to make sacrifices. At Salford and at Liverpool the exercise of the right of eminent domain would interfere with important existing interests. Another drawback was that the company did not propose to enter the cities of Liverpool and Manchester underground, and nowadays an underground approach is the only one that deserves to be considered when a new railway is proposed.

The Suez Canal Company, according to the "Electrician," London, has decided that every vessel, before it can pass through the Suez Canal, must satisfy the company's agents at Port Said or at Suez that it has on board (1) at least one electric searchlight of sufficient power to illuminate the channel 4,000 ft. ahead and constructed so as to admit of rapid splitting up of the beam of rays into two separate segments, with a dark sector in the middle; and (2) with electric lights capable of lighting up a circular area 700 ft. in diameter.

the Electric Building, where a room has been especially prepared for the holding of the meetings. Besides a number of interesting papers to be read on topics of interest to telephone men, arrangements have been made in the way of excursions and outings, that should prove most delightful, especially to the visiting ladies. An opportunity will also be afforded the delegates and their friends of examing the most modern telephone apparatus and appliances which will be exhibited by the various independent telephone manufacturers. The programme is as follows:

Monday, June 11.

The Ohio Telephone Association will meet at twelve M., in the Electric Building, for the purpose of organization to assist in the entertainment of the delegates and visitors,

At 8 P. M. there will be a meeting of the Advisory Board and Executive Committee of the Independent Telephone Association of the United States of America, at the headquarters of the Association on the third floor of the Electric Building.

TUESDAY, JUNE 12.

At 8 A. M. the headquarters of the Associa-

tion will be opened for the purpose of registering and issuing credentials to the delegates and visitors. The headquarters will be in room 301, third floor of the Electric Building. All persons are required to register before receiving credentials and tickets to the various entertainments.

At 12 m. first session of the Convention will be called to order in a room prepared especially for this occasion on the first floor of the Electric Building.

First will be an address of welcome. Second response, which will be followed by preliminary business and general introductions. After lunch the balance of the day will be devoted to inspection of the various exhibits of the manufacturers and material men, which will be on the first, second and third floors of the Electric Building.

In the evening a reception will be given by the Cuyahoga and United States Telephone Companies, on the seventh floor of the Electric Building, at which time the offices of the different telephone interests will be thrown open to visitors and the switchboard of the Cuyahoga Telephone Company inspected. There will also be music, flowers and light refreshments.

#### WEDNESDAY, JUNE 13.

At 10 A. M. the second session of the Convention will be held. The President will deliver his annual address, after which the following papers will be read:

"Toll Line Traffic," J. B. Ware, secretary and general manager of the Citizens: Telephone Company, Grand Rapids, Mich. Discussion.

"Telephone Development," Ed. L. Barber, president of the Northwestern Telephone Construction Company, Wauseon, O. Discus-

"Telephone Investments," Hon. Hugh Daugherty, president of the United Telephone and Telegraph Company, Bluffton, Ind. Discussion.

"Our Duty to One Another," Hon. C. W. Kline, president of the Interstate Telephone and Telegraph Company, Philadelphia. Discussion.

"Telephone Construction," Jas. E. Stewart, consulting engineer to the Telephone, Telegraph and Cable Company, New York.

In the afternoon the ladies attending the Convention will be given a tally-ho ride through the parks and boulevards, leaving the Colonial Hotel at 2:30.

In the evening the ladies, the delegates and their friends will be entertained at Hallworth's Garden. A special car, tendered by the Clevelar.d Electric Railway Company, will leave Euclid avenue and Bond street at 7.15 o'clcck. THURSDAY, JUNE 14.

At 10 A. M., the third session of the Convention will be called to order at which the following matters will be taken up: First, unfinished business; second, election of officers; third, "The Glad Hand to New Members," followed by inspection of exhibits and social sessions.

In the afternoon a boat ride has been planned for the delegates and their friends. The steamer "City of Erie" of the Cleveland and Buffalo Transit Company will leave the foot of St. Clair street at 2 o'clock, returning at 6.

In the evening at 8 o'clock the banquet will be held. This will be the great social feature. The best the land and sea affords to eat will be placed before the visitors. There will also be music andflowers and much eloquence as may

be inferred from the following programme of toasts:

Hon. Harry D. Critchfield, General Counsel of the United States Telephone Company, toastmaster.

Music. The Manufacturer.....

LADIES ON THE RECEPTION COMMITTEE. Mrs. H. W. Avery, Mrs. D. J. Kurtz, Mrs. J. A. Ebersole, Mrs. S. R. Driffield, Mrs. W. A. Foss, Mrs. H. J. Davies. Mrs. H. W. Jones. Mrs. H. C. North, Mrs. L. Sands.

Mrs. A. B. Foster,

### JAMES MILTON THOMAS.

Judge James M. Thomas, President of the Independent Telephone Association of the United States, was born in Ross County, Ohio, on April 24, 1858. He is a descendant of Samuel Thomas, who emigrated to America in 1620 as one of the Mayflower's sturdy passengers, and settled in New England.

Like many other prominent men, his early years were spent on a farm where he found

JAMES MILTON THOMAS, President of the Independent Telephone Association of the United States.

The reception Committee which will look after the enjoyment of the delegates and their friends is as follows:

D. J. Kurtz..... The Wm. Bingham Co. A. M. Barnes..... Miller Chemical Engine Co. J. A. Ebersole.....The Geo. Worthington Co. Wm. Smith....The W. M. Pattison Supply Co. H. J. Davies......National Carbon Co. H. W. Jones.....Cleveland Supply & Mfg. Co. A. B. Föster.....Cleveland Electrical Mfg. Co. G. C. Steele.....North Electric Co. H. W. Avery..... Avery Stamping & Tool Co. L. Sands......Williams-Abbott Elec. Co. W. P. Bowan.....J. A. Roebling's Sons Co-H. T. Pratt..... American Steel & Wire Co. C. S. Powell.... Westinghouse Elec. Mfg. Co. S. R. Driffield......Consumers Rubber Co-W. A. Foss.... American Toll & Telephone Co. Carl Seyler......McIntosh Huntington Co. C. W. Wason.....Cuyahoga Tel. Co.

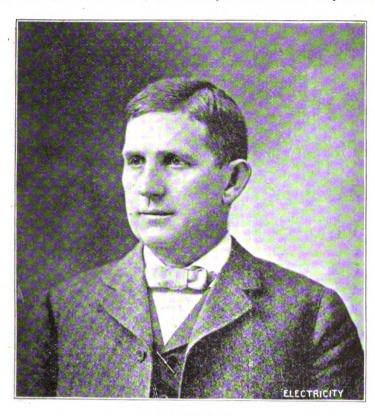

time to attend the district school and qualify himself for teaching. After attending the Ohio Wesleyan University at Delaware, Mr. Thomas took up the study of law and was admitted to the bar in June, 1884, and immediately entered upon the practice in Chillicothe. Having a good knowledge of the principles of law, a general acquaintance in the community and the full confidence of the public, as well as his colleagues at the bar, he soon built up a profitable practice, which continued to increase until 1893, when he was elected Judge of Probate.

To the public at large, and especially to the readers of Electricity, Judge Thomas is probably best known as a prominent, if not the most prominent independent telephone leader. He was the original choice for the office of President of the Independent Telephone Association of the United States, and the healthy

condition in which that body now finds itself attests his ability and talent as a business organizer.

#### GEORGE W. BEERS.

George W. Beers, one of the leading spirits in the independent telephone movement, hails board in room 215, Electric Building, Cleveland, during the coming telephone convention, where they will be pleased to see all of their friends, and to explain the merits of their goods. It is expected that they will be represented by Messrs. J. H. Montague, and J. F. Hemenway. They also state that they are making the ex-

GEORGE W. BEERS.

from the State from which all prominent men hibit in connection with that of the McIntoshapparently spring - Ohio. He is now, however, a resident of Fort Wayne, Ind., where he moved some eight years ago.

Mr. Beers has many business interests and is connected with many prominent commercial and financial industries. Among others, he is a director of the Citizens' Trust Company of Fort Wayne, the largest trust company in Northern Indiana. It is in connection with the Telephone, Telegraph and Cable Company of America that Mr. Beers is best known, the independent company that was organized in 1899 by a number of Eastern capitalists with the help of Mr. Beers to compete with the Bell monopoly and furnish telephone service at reasonable rates. In this movement, Mr. Beers has been most prominent and the results already achieved and shortly to be brought about are in great part due to his untiring efforts and executive ability.

#### THE FARR TELEPHONE AND CONSTRUCTION SUPPLY CO.

The Farr Telephone & Construction Supply Company of Chicago, will occupy room 306, Electric Building, Cleveland, June 12, 13 and 14, during the convention of the Independent Telephone Association of the United States. This company will have a fine display, consisting of several different kinds of telephones, generators, magneto bells, switchboard drops, etc. President C. W. Farr and General Manager E. W. Hurst will be present and glad to meet everyone interested in telephones.

# THE ERICSSON TELEPHONE COMPANY.

The Ericsson Telephone Company, 296 Broadway, New York City, will have an exhibit of their telephones and sample imported switch-

Huntington Co., their Cleveland distributing agents, who are assisting them by arranging

#### BY FRANK C. PERKINS.

Whatever may be said of the status of electric railways, central stations and power plants in England, it must be acknowledged that the "country house" in England has received its full share of attention in both electrical decorations and useful electrical appliances introduced into the household. While it will be noted from the accompanying illustrations that little has been done in these instances in the way of border light effects, ceiling lights and glass panels illuminated from the back, still the electrical lighting has been carried out with great taste and artistic effect. It will be particularly noted that fixtures and hanging lights are largely used, at the same time combination fixtures are not introduced and no gas or other method of lighting has seemed to be considered necessary in case of failure of the electrical plant, which argues well for the reliability of the private electric plant as installed in that country. Messrs. E. Scott & Mountain, Limited, of Newcastle-on-Tyne, Eng. has made a particular study of the needs of English country houses in the way of electric lighting plants and has installed a large number in the finest homes. They say in reference to its reception that there are hardly two opinions as to the superiority of electricity, as an illuminant, over any of the other methods of lighting at present in vogue; but even when no doubt exists on this point, there are often misgivings as to the reliability of the light, its safety, and the advisability of introducing it into houses where considerable expense has already been incurred in decorations. There is no question but that electric light can be installed not only without interfering with

FIG. 1.—DYNAMO HOUSE AND CELLS AT GREY TOWERS.

for outside connections, which will enable their visitors to call outsiders to their telephones. You are invited to call on them.

# The Canadian Electrical Association.

Owing to the fire, the convention of the Canadian Electrical Association, which was to have been held at Ottawa this month, has been postponed to next September.

the wall papers or ceilings, but also that its adoption often makes it possible to choose fittings more in harmony with the general design of the room than would be the case if gas or oil were used.

In addition to these advantages there are of course the better-known benefits arising from the use of the electric light, such as pure air in living rooms, less risk of fire, longer life of all

drapery, hangings and books, and general convenience and utility.

It is interesting to note the neatness and simplicity of the dynamo house and storage bat tery equipment of installation at Grey Towers, seen in illustration, Fig. 1. The generating plant is situated in a separate building adjoining the house, and comprises a locomotive boiler of large capacity which supplies steam to one of Scott & Mountain's vertical engines. This engine drives a "Tyne" dynamo, the current being sufficient to supply all the lights at the same time. Grey Towers is owned by A. J. Dorman and he has a most complete electric lighting and power installation including equipment for 250 lights and several motors for various household purposes. An attendant is not required after the usual hours as the storage battery has a capacity for running the entire 250 lights for three and one-half hours. Electric ovens, kettles, hot plates, small radiators, shaving cups, curling iron heaters, and laundry and billiard table irons are used quite extensively. It may be of interest to note the interior arrangements of some of these English country homes and the accompanying illustra-

### GOVERNMENT TELEPHONE SCHEME FOR LONDON.\*

As the Post Office is about to commence laying the underground mains in connection with the Government scheme for the telephoning of London, it may be of interest to give at this stage a few particulars of the area to be served and the exchanges to be established, together with some preliminary notes on the subject of the cables to be employed, the conduits and manholes to be constructed, and the switchboards and the method of working to be adopted.

The area to be served is that known as the "London Telephone Area," which, to all intents and purposes, is that at present served by the National Telephone Company. It extends from Reigate northwards to Waltham Abbey, and from Romford westward to Harrow, and embraces about 600 square miles.

The Central Exchange will be located in a portion of the premises in Queen Victoria street, presently used by the Post Office for Savings Bank business, and the completion of this exchange is promised within a year.

Fig. 2.—Dining Room at Hutton Hall.

tion will give the reader a fair idea of the interior decorations and lighting effects.

Hutton Hall is about ten miles from Middlesboro and is the residence of Sir J. W. Pease, M. P., and is so well hidden by the beautiful trees that surround it, that the traveler, unless he were especially on the lookout for it, would probably pass it unnoticed.

The electrical plant consists of an "Undertype" engine, dynamo, switchboard and accumulators. The voltage of this plant is 200 volts on account of the distance of the engine room from the Hall. In addition to lighting Hutton Hall, and the stable, farm, etc., the same plant supplies Mr. A. E. Pease's house at Pinchinthorpe, about 14 miles distant. The cables are lead covered and armored and are laid in a trench underground. At Pinchinthorpe the installation consists of 106 cells of storage battery, together with switchboard and necessary instruments. Over 100 lights are used in the house and stables and these are supplied from the storage cells. An illustration of the dining room at Hutton Hall is seen in Fig. 2.

Almost simultaneously with the opening of the Central Exchange, sub-exchanges will be opened at Westminster, Kensington, Wimbledon, Putney, Richmond, Chiswick, Kingston, and Twickenham.

As the work progresses in other districts, sub-exchanges will be opened at about similar distances apart, the nearest to the city in the various directions being probably about Marylebone in the northwest, Islington in the north, Stratford in the northeast, Stepney eastwards, Deptford southeast and in the vicinity of the Elephant and Castle, southwards. With a scheme of sub-exchanges carried out on the lines indicated an excellent service at a moderate rental should result.

The cables to be employed are paper-insulated and lead-sheathed. The advantages which dry-core cables (as cables with paper insulation are called) possess over the ordinary guttapercha and india-rubber insulated cables are low capacity, high insulation, small electrification and great compactness. For subscribers' lines the conductor will weigh 20 lbs, per mile,

the mean diameter being 35.5 mils, and the maximum resistance 43.89 ohms per mile; whilst the conductor of the cables for junction lines will weigh 40 lbs. per mile, with a mean diameter of 50 mils and a maximum resistance of 21.94 ohms per mile. For subscribers' circuits on main lines the largest cable to be used will contain 217 pairs, and the largest size for junction lines will consist of 108 pairs.

The following table gives some useful data

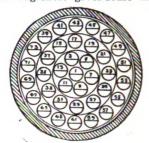

FIG. 1.

as to the various sizes of the two classes of cables to be employed on this telephone work:

TABLE I.

217	.160	2,650	19.19				

The paper used for covering the 20 lb. conductor averages 1 inch in width and for the 40 lb. wire \( \frac{1}{4} \) inch, the thickness of paper in both cases being about five mils. The paper is usually laid on longitudinally with a slight overlap, to prevent contact between neighboring wires, and is tied spirally with thin string. The wires are laid up in pairs uniformly twisted together, the length of the complete twist being 4 inches for the smaller conductor cable and 6 inches for the larger. One wire of a pair is covered with white paper and the other wire with colored paper, usually red, as a means of distinguishing the wires for jointing purposes. Between each layer there is a spiral wrapping of paper (usually 5 mils. thick) and a final wrapping of similar paper is added between the outside layer and the lead sheath.

The following table shows how pairs are stranded together to form any size of cable, and Figs. 1 and 2 represent a section of a 37 and a 48 pair cable respectively:

TABLE II.

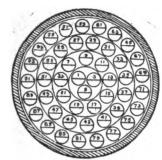

Number	Number of Pairs of Wire.										
of pairs in cable.	Center.	First layer.	Second layer.	Third layer.	Fourth layer.	Fifth layer.

When the stranding has been completed the

<sup>•</sup> From the "Electrical Review," London.

"core" is thoroughly dried at a temperature not exceeding 225° F. In some cable factories this is done by placing the iron drum, on which the completed core has been wound, in a hotair chamber which is kept at a uniform temperature of about 225° F. The time taken to dry the paper by this process varies from three to six days, according to the size of the cable and the amount of moisture in the substance

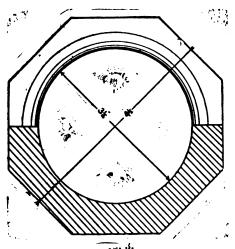

F1G. 2.

of the paper. In other factories the core is placed in an iron cylinder and dried under vacuum, and by this method the drying can be done in about one third the time required by the ordinary oven process.

After the core has been dried it is lead sheathed, molten lead at a temperature of not less than 600° F. being forced on round the core under a hydraulic pressure of from two to three tons to the square inch.

The completed cable is put in a tank of water, where it remains for 24 consecutive hours, in order to prove the sheath, and the cable is thereafter subjected to electrical tests for electrostatic capacity, insulation and conductor resistance.

In the case of both the 20 lb. and the 40 lb. conductor cables, the mean electrostatic capacity of each wire, measured against all the remaining wires of the cable and the lead sheath to each is .08 microfarad per mile; and the mean wire to wire capacity of each pair, all the remaining wires in the cable, and the testing battery and apparatus being involved, must not exceed 70 per cent. of the mean wire to earth capacity. This low capacity is mainly due to the large amount of air space in drycore cables, averaging about 60 per cent. of the entire internal space. Indeed, provided the

paper used has a low specific inductive capacity and has been thoroughly dried, the capacity may be very accurately gauged by the amount of air space in the cable, and this, of course, is regulated by the width and thickness of the paper.

The insulation resistance of each wire in any cable from every other wire in the cable and from the lead sheathing, all of which are to

earth, must not be less than 10,000 megohms per mile after one minute's electrification at a temperature of not less than 50° F., the electrification during the test to be steady. The voltage for this test may be 600, but that usually employed is 450.

#### CONDUITS.

Hitherto the Post Office has confined itself in underground conduits to the use of castiron pipes, but till now the Post Office has never had to lay more than about half a dozen conduits in any one trench. However, this big scheme of telephoning London by means of underground wires brings about an entirely new condition of things. Under this plan 50 conduits in one trench will be quite common in the city, and in special cases this number will be much exceeded. In such quantities 3 inch cast-iron pipes require a large amount of space, and space, even underground, is very limited in London. The Post Office has, therefore, resorted to glazed earthenware ducts in place of cast-iron pipes where the number of conduits exceeds six. An end elevation, showing half section of the form of duct to be employed, is shown in Fig. 3, which also gives the sectional dimensions of the duct. It is made in two lengths, namely, 18 and 24 inches, the shorter duct being used only where the conduits enter manholes for the purpose of breaking joint.

(To be continued.)

# THE MANAGEMENT AND CARE OF A MODERN TELEPHONE CENTRAL OFFICE.

BY P. KERR HIGGINS, A. M. I., E. E.

It is admitted by the majority of telephone engineers, that the future ideal telephone system is one in which the common battery is used, in other words, one in which the power for signaling and talking is furnished from a battery located in the central office. It is true this system is not yet perfected and much improvement will be noticed as the number of such plants increase, but the principle involved is correct. It is more easily and economically maintained and the fluctuation of the power can be kept down to a minimum.

The highest and lowest talking efficiency attained in the local battery system is not quite reached in the common battery system, but the average for all subscribers is very much greater in the latter. Inasmuch, then, as the common battery system is evidently the one of the future (and as enough has been written on the other), we will assume that the central office is so equipped.

No one will dispute the fact that a great measure of the success of a telephone piant lies in the management and handling of the central office; close attention and constant study on the part of those in charge is absolutely essential in order to maintain a uniform, quick and effective service.

We assume that the office has been equipped in a substantial manner, so that with proper care and attention a good and efficient service can be given. This involves the necessity of a plant which requires from the operators the least amount of labor and study, and so arranged as to reduce the possibility of mistakes by them to a minimum.

The plant under consideration is a medium sized one—say 2,000 subscribers—equipped with a switchboard, complete battery outfit, power, main and intermediate cross connecting boards, etc., the switchboard being divided off into sec-

tions of three positions each, each position having about 110 lines to be cared for by an operator. The care of the switch-room proper is placed in the hands of a chief operator, with an assistant if necessary. A special desk is provided for this chief so furnished and arranged as to enable her to monitor all the positions under her care and to keep all the necessary records and information which she may be called on to give to subscribers. By careful study and a series of peg counts, the lines should be so arranged as to balance up, as nearly as possible, the work of the operators, giving to the exchange inspector a note of the numbers to be changed to other positions, so that he may make the necessary cross-connections on the intermediate board provided for this purpose.

THE OPERATION OF THE SWITCHBOARD.

It is difficult to lay down a set of rules by which operators may be governed, but the following may be taken as a base, others being added to meet special cases:

First—All operators must report promptly to the chief at the hours designated and quietly take their places at the positions assigned them

Second—No unnecessary noise or talking will be permitted.

Third—All calls must be answered promptly and supervisory (clearing out) signals watched closely, taking down the connections when the proper signal has been given. Operators must assist each other whenever possible and necessary.

Fourth — Apparatus must be handled with care and in the prescribed manner. All connecting cords must be taken down by the plugs only.

Fifth—Talk closely into your transmitter in a clear and natural tone.

Sixth—Answer calls by "number" and repeat the number given by the subscriber. In making connections be very careful to get the proper line jack and see that it is not busy before completing connection. Never break in on a connection, for by carefully watching your supervisory lamps or signals you will know exactly how the connection stands.

Seventh—Study your work and your subscribers in order that complaints may be avoided. Good manners and patience are absolutely necessary to your success as an operator.

Eighth—Do not turn round when anyone enters the room, but pay strict attention to your business.

Ninth—When in doubt as how to act, or when a subscriber complains or speaks in an improper manner, turn the call over to the chief operator.

Tenth—When you report for duty and when you are relieved, enter and leave operating room in a quiet and orderly manner, always hanging up your receiver in its proper place. Always lock your locker and keep your personal effects in same, not leaving them scattered about.

Women have proven to be the most suitable operators, their voice being more flexible and even, their handling of the apparatus more delicate and swifter, their persistence and patience greater, and as a whole their services are much more acceptable to subscribers. Apart from this, the cost of labor is less.

In choosing operators too much care cannot be taken, and only those possessing the necessary qualifications should be chosen. A good education, good manners, good eyesight and hearing, and a voice clear, strong, and of good

timbre, are absolutely essential. The appli cant should also have good health. It is well in handling operators to relieve them from duty frequently, as this breaks the tension, is humane, and will prove a blessing in disguise. Operators' hours should never exceed eight hours' actual work. They are quick to appreciate justice and when well, firmly, yet kindly handled will require very little disciplining, more especially if good selections have been made in the beginning. Never discipline an operator at the switchboard, take her to one side, otherwise it has a demoralizing influence. and humiliates her sometimes when she is not to blame.

In the sitting room provided for operators there should be placed a 'phone, where they can, when off duty or specially called, talk to their friends. The abuse of this privilege should be treated as a breach of trust. Good literature should also be provided. Tea or coffee in winter and iced lemonade in summer should be provided in the lunch room. These small attentions will be appreciated by the operators, keep them out of mischief and make them better satisfied. A special signal, from chief's desk to sitting room, should be connected for calling operators on duty.

#### CHIEF OPERATOR.

The person holding this position should have exceptional ability, large experience, and be thoroughly familiar with the operation of the apparatus. It will be her duty to assign operators to positions, make a record of same for future reference, and keep in close touch with the operators by means of her monitor, take care of all special calls turned over to her, assisting and helping the operators in every possible way, with a view to greater efficiency. A book should be kept for recording all switch-board trouble, with headings as follows:

Date.	Nature of trouble.	Hour reported.	Date and hour fixed.	Inspector.

This should be neatly and faithfully kept.

Notices should not be allowed on the switchboard, each operator being provided with a small tablet, posted and corrected by the chief as often as necessary. These notices should be as few and as brief as possible and not contain information such as changes, new subscribers, etc., this being the duty of the chief or special clerk.

It will further be the duty of the chief to see that the operating room is clean and well ventilated. Places should be provided for operators' portable head 'phones, and the chief should see that they are put in their proper places and that operators are orderly.

# CENTRAL OFFICE EQUIPMENT.

The plant, during the day and night, will be under the constant care and attention of an inspector, experienced and qualified in every way to care for the same. Inexperienced help (no matter how small the salary) is always expensive and very unsatisfactory, the plant deteriorating very quickly if not cared for constantly by an experienced man.

# DAY INSPECTOR.

He will care for all special trouble, and that which will not interfere unduly with the operation of the switchboard. He will also examine the equipment every day so that when inspected by the chief inspector, at irregular

intervals, everything will be found permanent and in good repair. No temporary work of any character should be tolerated. Especially does this apply to common battery systems. He will make all cross connections, keep cable records, and care for power plant, etc. All charging of batteries should be done, when possible, during the day, and records kept showing discharge readings every hour, also voltage before beginning charge and after end of charge.

#### MACHINES.

These, when not in use, should be tested daily, and when in use the commutators should be kept smooth and properly lubricated. Gale's stick commutator compound has been found very good for this purpose. Brushes must be kept clean and properly set, no sparking being allowed. In smoothing the commutator use very fine sand paper. Neither oil nor dust should be allowed to accumulate on or near the machines, and great care must be taken in starting them to see that the proper resistance is cut in.

#### ACCUMULATORS.

In the care of accumulators (which should be located in a cool room, well shaded) the principal things to be carefully avoided are buckling (twisting or warping of the plates) and sulphating (white patches); also, keep them free from any wire clippings or other material likely to cause short circuits. Uniform and regular charging are absolutely essential to the longevity of the battery and it should be examined every day with an electric lamp so that the bottom of cell may be seen. Hydrometer and voltmeter tests must be taken frequently, and specific gravity not be allowed to go below 1,180, nor above 1,200. Voltage never below 1.9. While 1.9 is given as a safe discharge rate, it is not safe to do this continually. When cells are installed, a certain economical discharge rate is given them as also a certain number of ampere hours capacity, but, as this paper is intended only to cover the general care and is not descriptive of the apparatus, it will be sufficient to say that this economical discharge rate should not be exceeded except on rare occasions, such as breakdowns, etc., otherwise sulphating and buckling of the plates is sure to set in, and, if not remedied, finally ends in the disintegration of the plates. The usual make of plates allows a normal discharge rate of about .0165 ampere per square inch of surface of positive element, and a discharge capacity of 4.5 ampere hours per pound of all elements (positive and negative). When a cell reaches 1.9 or thereby the voltage falls very rapidly, and must therefore be carefully watched when it is necessary to discharge beyond this point. The efficiency of a cell or battery may be increased by charging and discharging to the same point at very slow rates, the efficiency being the quotient of the current taken out divided by that put in. The loss due to internal resistance is proportional to the square of the current flowing. The floor of the battery room and surroundings of the cells should be painted with asphaltum paint to prevent damage by spray.

Evaporation may be reduced by placing over each cell, properly insulated, a sheet of glass; this also helps to keep out dust, etc.

Where fuses are designated they must always be placed and of proper capacity, no wire jumpers being allowed.

Blisters on the plates should be carefully watched and gently pressed back into place by a flat piece of hard rubber or wood—never use

metal. Acid will seldom require to be added unless some has been spilled, and when water is added it should be done with a siphon pump so that it reaches the bottom of the cell. The elements should always be well covered with electrolyte, whether in use or not, only the lugs or connecting rods being exposed. Cells must never be tampered with unnecessarily, and charging should be stopped whenever the cells commence to boil or spray, as any charging done after this (as a rule) is only waste of energy and a waste of the electrolyte, necessitating the addition of more water. When it is necessary to add water, it is found in the end to be more economical to use distilled water, as vegetable and sand deposits are thus avoided and cell easily kept clean. When a cell is in good condition, the positive plate is of a chocolate brown or deep red color and the negative steel gray. No particles must be allowed to fall or remain between the plates.

#### NIGHT INSPECTOR.

He should make regular and systematic tests of all connecting cords, lamps, visual signals, drops, etc., as also a special test of the multiple for false tests, broken test wires, etc. These tests should be continous, that is, as soon as completed, they should be repeated. All broken and defective cords ought to be repaired by him while they are in the switchboard, and only taken out when they are too short or beyond repair. In making repairs, especially in the multiple portion, great care must be taken not to break adjacent wires, connections, etc., and all work done should te permanent.

Where party lines are in use, a test ought to be made each morning with a voltmeter (or biased bell) to determine if the polarity is right. When repairs have been completed, a full report must be entered and initiated in the exchange trouble record.

What are known as "scratchy cords" are frequently caused by brass rubbings collecting on the rubber bushings, therefore, before cutting the cords, it is best to clean the plug thoroughly; sometimes it will be necessary to use fine sand paper for this.

## SPECIAL SIGNS.

Special signs or marks are used in central offices to indicate to operators special conditions, such as: 1. Broken or bad cord, a small piece of fiber tube is slipped over the plug (this is better than tying a knot on the cord). 2. Lines known to be in trouble, especially on common battery systems (where it is necessary to plug them up), are indicated by a rubber plug; if this is not done, operators are liable to tell calling subscribers (wishing this number) that line is busy when it is really out of repair, and in any case, it is found much more satisfactory to tell a patron that the line he wishes is out of order, than to hold him for several minutes, and then tell him you cannot get them. The wire chief notifies the chief operator the moment a line is cleared and she removes the obstruction. The day inspector, also, makes frequent checks of all lines so plugged up, as does the chief operator, and in this way no complaint has been found. 3. Dead lines, that is lines not in use, are indicated by a wooden plug, or better still, short brass paper fasteners. 4. Changes of all kinds are indicated by a small white spot, painted over the jack; this indicates to the operator that all calls for this number are to be turned over to the chief operator or to the information desk, if one is provided.

The operating department proper of an ex-

change should be directly under the manager, and the technical part under the electricians, each consulting and combining with the other, to the end that the highest efficiency may be reached and maintained.

#### MICHIGAN TELEPHONE SITUATION.

[The conditions surrounding the telephone situation in Michigan are in many respects more peculiar than in other States, and the following statement by Mr. J. B. Ware, the President of the Independent Telephone Association of Michigan, will be of general interest at this time.— ED.]

The Michigan Telephone Company has been doing business in the State about twenty years and is a Bell Company, as is officially stated by the president of the Erie Telephone Company (the owner of the Michigan Company), in his annual report January 2, 1899, in which is the following: "The Michigan Telephone Company operates exclusively under the American Bell Telephone Company's perpetual licenses in the State of Michigan."

The independent companies began to operate in 1895. Their growth was at first slow, but during the past two or three years, both Bell and independent have had remarkable growth, exceeding the most extravagant expectations.

In the case of the Bell Company, this growth is easily ascertained from official figures as fol

December	31st, 1896	15,025 to	elephones
**	31st, 1897	16,270	-6.6
66	31st, 1898	19,539	"
66	31st, 1899	32,231	"

Official figures of the Independents on December 31, 1899, are not at hand, but a careful estimate of the State (calling the Upper Peninsula 2,800 - the conditions being comparatively unfamiliar to the writer) showed the number to be about 29,000.

This remarkable growth of the Michigan Bell is easily accounted for as follows:

As competition occurred, the Bell Company reduced its rates below the rates made by the Citizens' or Independent Companies, and in many cases the charges made did not pay operating expenses. Thus, in Grand Rapids the Bell gave two years of free residence service, then made a \$12 residence rate. During the entire period it has had from three to twenty solicitors; it furnishes free service in a number of cities and towns at the present time, by allowing the telephones to remain in service after parties refuse or neglect to pay for same, and even after the telephones are ordered out.

The Bell exchange in Grand Rapids, as in other places in Michigan, has not had sufficient telephone rentals to pay operating expenses during any quarter for over three and one-half years.

The result of competition upon the Bell rates is shown by the following:

BELL EXCHANGE RATES.

	Janua	ry, 1896.	Japuary, 1900.		
	Business.	Residence.	Business.	Residence.	
Detroit	72	48	36	24	
Grand Rapids	3)				
Lansing	<b>- 48</b>	36	24	12	
Kalamazoo	)				
Holland	48	<b>3</b> 6	18	12	
Charlotte	} 36	24	24	6	
Hastings	500	-4	27	U	
Lowell	)				
Portland	<b>3</b> 6	24	12	6	
Greenville	)				
Alpena	48	36	6	3	
Muskegon	48	<b>3</b> 6	no renta	l but a 2‡	
		(	cent. per	call fee.	

These less than cost rates have secured a large increase among people not directly connected with commercial interests.

The growth of the Independent's or Citizen's Companies is owing largely to the following reasons:

First - Reasonable rates, regulated by franchise. (The Bell Company has no franchises regulating rates).

Second—Service far superior to that formerly given by the Bell Company and equal and often superior to that now given by the Bell, after rebuilding exchanges two, and in some cases, three times.

Three — More rapid development of local toll lines and at present a more complete State line system in the Lower Peninsula (except the southern tier of counties) than has the Bell Company.

Fourth-The knowledge by the people of the State that the independents are not only paying expenses, but dividends, so that as long as the independents are in the field, rates will remain reasonable and service be satisfactory.

The Independent Companies do not give free

As illustrating the accuracy of statements above the following table is given of the growth of the Grand Rapids Citizens' exchange, where no free service is given, and no solicitors have been employed for more than three years:

Date.	Telephones in service				
September 1st, 1896	1.460				
January 1st, 1897					
October 20th, 1897					
November 1st, 1898					
November 1st, 1899	3,064				
May 9th, 1900					

Numerous other cities and towns in the State can show equally satisfactory growth in their local or independent exchanges.

As showing the toll or State line advantages offered by the independents, the following list of exchanges and toll stations within fifty miles of Grand Rapids gives the number of telephones, both Citizens and Bell:

Citizens.

Bell-

Exchanges.

Exchanges.	Citizens.	Deile

Other toll stations 172	67
Total telephones	
within circle 4,441 2	,174

Total points reached - Citizens 218. Bell 90. Exchanges and toll stations reached exclusively by the Citizens' lines, 127; excess telephones

Summary (Grand Rapids Circle):

Exchanges 10 or more	Citizens.	Bell.
telephones		
Total points reached		

If all Eric property was consolidated against the Citizens' Company the result outside of Grand Rapids within the circle would be:

Michigan Bell New State Company Central—Kalamazoo	10° 5	14
Total Erie Citizens		
Citizens' excess	17	30

While the above is not a fair average for all cities in the State, yet equally good averages numerically can be obtained by using Saginaw Alma, St. John's, Traverse City, Cadillac, Muskegon, Allegan and Benton Harbor as centers for similar fifty-mile circles.

The selling of the Detroit exchange, the Kalamazoo exchange and toll line system (Central Telephone Company) and a majority of the New State Telephone Company stock (toll lines around Detroit) to the Erie Telephone Company in January and February, 1900, threatened, as was intended, to overthrow the independent movement of Michigan.

The telephones included in properties sold to the Erie Company were:

New State lines	4,30
(Total	1 076

Although negotiations for the properties progressed, no other sales were completed. As a result of this attempt to buy out opposition and in order to prevent the same, several sales and consolidations took place among the independents, the most important being the purchase by the Citizen's Telephone Company (Grand Rapids), of the Lansing property and a majority of the Muskegon Company's stock.

Recently a State contract for the interchange of business for twenty-five years, on a fair, equitable basis, has been entered into by companies owning eighty per cent. of the telephones in Lower Michigan, not controlled by the Erie Company, which contract also has, as one of the parties thereto, the United States Telephone Company of Ohio.

This insures long distance service, not only to Ohio, but to other States, and thus will be soon developed, that branch of the business in which the Bell Company has heretofore had the control-the Interstate Long Distance Toll business. What alliances or working agreements may be made with the Western Union or other companies cannot be stated, but with long distance business secured to the

Michigan Independents, the Bell Company's last great advantage will be overcome, and the final result is already open to speculation.

Before closing this article, certain information obtained from the sworn reports of the telephone companies, filed with the State for the year ending December 31, 1899, is presented. Each Michigan Company is required to show its gross income for 1899 from exchanges and toll lines.

The following list is selected from said re-

	Telephones.	Gross income.
Michigan Bell Co	32,231	<b>\$</b> 765,58,779
Detroit Telephone Co	5,200	161,247.57
New State Co		93,821.43
Kalamazoo Exchange	819	11,695,88
Central Co., Kalamazoo	413	18,403.25

The capital of the Michigan Telephone Company has been \$2,500,000 for several years, and the articles of association were not amended until in April last authorizing the issuing of \$7,500,000 more stock.

The bonded debt of the Michigan Company is \$5,000,000, bearing 5 per cent, interest. The Erie Company announced 11 per cent. dividends on the Michigan Telephone Company stock for 1899, so that the interest and dividends for one year on the bond and stock issue (December 31, 1899) would be 5 per cent. on \$7,500,000 or \$375,000.

It is of interest to note that in 1899 the gross income of this Bell Company was but \$765,000, or 10 per cent. (plus) of the stock and bond

Taking the average Bell telephones for 1899 as 26,000, the average income per telephone from both toll line and exchanges was but \$29.49 per instrument. The Citizens' Company's Grand Rapids plant has cost about \$80 per telephone. It has no bonded or mortgage debt. The other independent Michigan companies make as good or better showings, as to average cost, as a rule.

Can the Bell Company with an average issue of stock \$78 per telephone; bonds \$156 per telephone, and a total issue of \$234 per instrument (to say nothing of royalties, extraordinary expenses, or onerous contract conditions), be able permanently to compete with companies having but one-third the investment per instrument, and giving at least equally good service? If not, can it permanently do business in Michigan at a loss? These are the two questions that are most frequently being proposed among both telephone people and the public

With the Detroit, New State and Kalamazoo properties still being operated in connection with the independent lines, under twenty-five year contracts, and the lack of information as to just what policy will be pursued with said properties, other interesting questions arise which the writer does not presume to discuss at this time.

A few conclusions, however, the writer has reached, among them being that-

First-Reasonable rates are here to stay.

Second—Good service must be and will be maintained.

Third-The telephone development is only fairly begun.

Fourth-Exchange rates in Michigan will be regulated by local franchises, or by State legislation.

Fifth-It would seem from this review that only by an increase of exchange rates can the Michigan Company succeed financially, and such increase cannot be made permanently except by its again securing the monopoly of the State, which is an absolute impossibility.

Everything indicates the permanency of the independents in Michigan and their success financially is conceded.

# The Amended Cuban Tariff.

Under date of March 31, the Cuban tariff was amended, to go in force on the 15th of June. Under the terms of the new tariff questions arising in the administration of customs regulations are to be referred to the collector for the port of Havana, and from his decision there shall be no appeal unless the collector shall deem it expedient to ask the War Department for any special instructions.

Importers who shall not feel satisfied with the valuation or classification of merchandise as fixed by the collector shall pay the duties imposed, but they may file at the time of payment a written protest or appeal, in which they may state briefly the value or classification of the merchandise, which they claim should have been established. That protest and appeal will be transmitted by the collector, through the customs service, to the military governor of the island, and it will be his duty to review, and either affirm, reverse or modify the action complained of.

The rates on electrical instruments, accessories, apparatus, etc., are as follows:

Agriculture implements, propelled by electric power, 10 per centum ad valorem.

Acetylene apparatus, of metal other than copper, 20 per centum ad volorem.

Acetylene apparatus, of copper or its alloys, 20 per cent ad valorem.

Electrical apparatus for illuminating purposes, 20 per centum ad valorem.

Telephonic apparatus and telegraphic apparatus, 20 per centum ad valorem.

Scientific apparatus, including graphometers phonographs, hydrometers, etc., 25 per centum per valorem.

Automobiles, 20 per centum ad valorem.

Conducting cables for electricity over public thoroughfares, \$7.50 per 100 kilograms, gross weight, subject to a tare allowance of 13 per cent if imported in cases or barrels, or 7 per cent. if imported in hampers, and of 5 per cent. if imported in any other way.

By conducting cables for electricity is meant cables composed of one or more wires of copper or any alloy of copper, whatever may be their thickness, provided that they be covered with an insulating wrapper, without taking into consideration whether they are enclosed in pipes of iron or lead or strengthened with cordage or iron or steel wire.

Cables of wrought iron or steel, \$1 per 100 kilograms, gross weight.

Carbons prepared for electric lighting, \$3 per 100 kilograms, gross weight.

Carriages for street railways, 25 per centum ad valorem.

Signal disks, or wrought iron or steel, 80 cents per 100 kilograms, gross weight.

Dynamo electric machines, 20 per centum ad valorem.

Accumulators, 20 per centum ad valorem.

Insulators, of glass, \$1 per 100 kilograms, gross weight, subject to tare allowance of 30 per cent. if packed in cases or barrels, or of 20 per cent. if packed in crates or otherwise.

Insulators, of porcelain, \$5.80 per 100 kilograms, gross weight, but subject to a tare allowance of 30 per cent, if packed in cases or barrels, or of 16 per cent. if in hampers or otherIncandescent electric lamps, mounted or not.

\$2.50 per hundred.
Electric switches, 20 per cent. ad valorem.
Electric elevators, 20 per cent. ad valorem. Graphite, unwrought, 20 cents per 100 kilograms, gross weight.

Graphite, prepared, \$5 per 100 kilograms, gross weight, subject to a tare allowance of 10 per

cent.

Indicators, 20 per centum ad valorem. Inductors, 20 per centum ad valorem. Manganese, 10 cents per 100 kilograms, gross weight.

Motors, electric, 20 per centum ad valorem. Electric agriculture machinery, 10 per centum ad valorem.

This paragraph provides for these electric machines which are used by farmers and agriculturalists for preparing the ground and gathering the crops; also those employed in order to clean the crops and improve them without essentially changing their nature.

### "Phono-Electric"-The New Wire Conductor.

Engineers are showing great interest in a new wire called "Phono-Electric." This is an exceedingly high-grade wire and is admirably

fitted for telephone, telegraph and trolley use. "Phono-Electric" is perfectly homogeneous, both with mechanical and molecular structure

and does not depend upon a hardened skin for its strength as do other drawn wires.

A series of interesting tests were made on skin effect by removing successive strata from the surface of "Phono-Electric" wire, and its tensile strength was found to be uniform throughout the whole disparent. throughout the whole diameter.

Hard drawn copper wire was subjected to the same treatment, and it was found that once the skin is removed or injured in any way the strength of the wire is reduced to that of ordinary soft copper.

The perfect homogeneity of "Phono-Electric" wire gives it a tensile strength for the various sizes of wire from forty to forty-five per cent. greater than that of hard drawn conner wire

per cent. greater than that of hard drawn copper wire.

Equally important with tensile strength in a wire is the power of enduring severe strains without taking a permanent stretch, thereby weakening the wire for future emergencies.

A set of comparative tests shows that "Phono-Electric" has an elastic limit forty per cent. greater than that of hard drawn copper wire. This high elastic limit is of great value, and gives a security and permanence to value, and gives a security and permanence to the work that no other material will. Only steel can resist strains better, and steel is a vastly worse conductor, and also subject to

"Phono-Electric" is a remarkably tough wire. This toughness enables it to resist bending, kinking, wrenching, sudden blows, and slow distortions without giving way. In electrical work the trolley wire comes in

for hard service. At turnouts it often comes in for hard knocks from the trolley, all sorts of pounding and wrenching, to say nothing of occasional vicious arcing at curves and frequent heating from overloads and short circuits.

To stand up successfully under such a test, the trolley wire must not only be strong, but must be tough and ductile, and retain these properties under all the severe conditions of service. It constantly happens that the passage of the trolley wheel is accompanied by small arcs set up betweeen wheel and wire. These burn and roughen the wire and anneal parts of its surface. If the wire is ordinary parts of its surface. If the wire is ordinary hard drawn copper, the hardened skin is de-stroyed, and the wire thus weakened rapidly succumbs.

This is the secret of the breaking of trolley

wire at curves where there is heavy service, areing being established by the flange of the trolley wheel.

"Phono-Electric" is free from this serious difficulty, for it does not maintain an arc readily. Its fusing point is high, and it does not furnish enough metallic vapor to keep an

arc going.
"Phono-Electric" does not rust or corrode for trolley wire on hard use, for long and difficult spans, and for telephone and telegraph lines in exposed and troublesome places it stands unrivaled.

# THE TELEPHONE WORLD.

#### A Valuable Property.

The Telephone, Telegraph & Cable Company of America, says the Boston "News Bureau," was pretty well informed regarding the telephone situation and value of the Erie property when it purchased a controlling interest in the stock of the company in February last.

In a circular letter of Messrs. Wilson & Stephens of New York an interesting letter from President Charles J. Glidden is published giving valuable information in regard to the company as follows:

The Erie Company owns a majority of the stock of the following operating companies: The Cleveland Telephone Company, the Northwestern Telephone Exchange Company, the Southwestern Telegraph & Telephone Company, Michigan Telephone Company and Wisconsin Telephone Company.

These operating companies have the exclusive and perpetual right to operate in their respective territories under the Bell patents and to enjoy, besides, the use of the long distance lines and those of neighboring Bell companies. The territory covered is as follows:

County of Cuyahoga, Ohio, including the City of Cleveland; Minnesota (excepting only Duluth), North Dakota, South Dakota (excepting only the Black Hills), Texas, Arkansas, Michigan, Wisconsin.

The estimated population of the territory embraced as above is 12,000,000, or about one-sixth of the entire population of the United States,

# Opposing the Bell Company in Missouri.

Articles of incorporation of the Kinloch Long Distance Telephone Company of Missouri were filed with the Secretary of State at Jefferson City on June 7.

This means that the Kinloch Telephone Company is about to enter the field against the Bell Company in the long distance service.

For the present the competition will be confined to towns in the States of Missouri and Illinois.

Work is to be commenced immediately on the line. Connections will be made with St. Charles, Mo.; Alton, Ill.; Belleville, Ill., and other nearby places. Small telephone exchanges will also be established in these towns.

The directors of the long-distance company are largely the same as those of the local company, and the stockholders are almost identical so that the two concerns are practically one institution.

Vigorous efforts are being made by the State Telephone Company to gain a foothold in Plainfield, N. J., in order to compete with the New York and New Jersey Telephone Company. An application was made by the company to the North Plainfield Borough Council recently for a franchise to string wires and operate a telephone system in the borough. The company agrees to lease telephones for house service, unlimited, for \$24 per year, and for business houses for \$36 per year—a reduction of 50 per cent from the rates enacted by the New York and New Jersey company for the same service. The new company will build a line connecting all the towns of Union, Somerset, Middlesex, Essex and Morris Counties.

A consolidation of some of the telephone companies in New York State is said to be pending. The companies affected are the Hudson River (Bell) Telephone Company and the Northern New York Telephone Company. The latter, which is an independent concern, was recently taken into the control of the Hudson River, and it is now announced that the Troy Telephone & Telegraph Company will be the next to be absorbed. The capital stock of the Troy Company is \$250,000, Last March authority was given to increase the stock of the Hudson River Company from \$2,000,000 to \$8,000,000. This increase, it is now said, was for the purpose of consolidating some of the independent systems in its territory. So far only \$250,000 of the new \$1,000,000 of stock has been issued.

Petitions are being circulated in Independence, Coffeyville and Cherryvale, Mo., for signatures which will be presented to the city council of Kansas City, Mo., shortly, asking for a franchise for the Hickman-Perkins Telephone Company to operate in Kansas City. This telephone company operates in many points in Southern Kansas and the object of asking for the franchise is to give this section of Kansas direct telephone connection with Kansas City. If the franchise is granted, it will connect Kansas City with several points in the Indian Territory, including Bartlesville, as well as Southern Kansas towns.

Superintendent Wilde of the southern division of the Michigan Telephone Company is securing bids for the erection of an exchange building at Battle Creek similar to that being installed at Kalamazoo, Mich. It will be two stories high, built of pressed brick with stone trimmings, and equipped with a modern switchboard.

#### Boston & New York Telephone Company.

The annual meeting of stockholders of the Boston & New York Telephone Company was held in Dover, Del., recently. The following board of directors was elected: Churles E Adams, Oakes Ames and Frank A. Cutting, of Boston; W. H. Eckert and H. E. Gawtry, of New York; William F. Hall stead, Secanton, Pa.; Z. Swift Holbrook, Boston; William J. Latta, Philadelphia; Martin Maloney, New York; Joseph B. McCall, Philadelphia; Charles W. Morse, New York; Arthur S. Temple, Boston; Frank Tilford, New York; James L. Wolcott, Dover, Del. The officers of the company are: President, Charles E. Adams; secretary, John B. Stauffer; treasurer, Oakes Ames.

President Adams in his annual report said: "During the past year a large amount of preliminary work has been accomplished for the establishment of a telephone exchange in Boston and other cities and towns in Massachusetts, together with the construction of a toll line between the cities of Boston and New York. Contracts for over 5,500 subscribers, covering a period of five years, to the exchange system, now under construction in the city of Boston, have been received. The underground work has been constructed with a view to permanency and over 100,000 feet of duct has been laid up to the present time in the business section of the city, which will enable the connecting of a large number of subscribers with the main exchange in an expeditious and economical manner.

"Rights of way have been secured from Boston to New York for the purpose of building a toll line. We have secured telephone franchises and rights of way in 55 cities and towns in Massachusetts, and a model exchange has just been constructed in Stoughton, Mass, which will be followed by other telephone plants in communities adjacent to the city of Boston. The establishment of a telephone business as contemplated by the Boston & New York Telephone & Telegraph Company requires, for present construction and future growth, a very large expenditure of money, but every financial emergency has been met, and the business energy, together with the strong aggregation of capital that has been added to the company's resources during the past year, makes the possible future look even more satisfactory than the most enthusiastic in the early history of our company predicted,"

A dispatch from Detroit, Mich., states that a number of physicians are behind a movement to organize a telephone system in Detroit for the especial benefit of doctors and druggists, who feel indignant at the treatment they are getting from the telephone company. The enforced use of nickel-in-the-slot machines in drug stores has stirred up a great deal of dissatisfaction, and the service is bad in other ways. About 70 physicians have signed an agreement to take out their 'phones when 350 signatures are obtained. One prominent physician says an independent exchange with about 1,200 subscribers could be built and operated economically. The plan is to limit the subscribers to physicians, druggists, hospitals, livery stables, and perhaps undertakers. An offer of backing for any sum required to establish a plant is said to have been received.

The business men of Worcester, Mass., have formed a company to be known as the Citizens' Telephone & Telegraph Company, and will incorporate under the laws of Massachusetts with a capital stock of \$300,000. The men interested will petition the city council for locations for underground conduits, and the necessary poles and conveyances for the lines. Henry S. Pratt, president of the Ware-Pratt Company is at the head of the new corporation, and the directorate includes a number of the best known business men of that city It is the intention of the incorporators to join forces with the independent long distance company, which has petitioned for a right of way through the city, so far as long distance service is concerned, although at present they claim no affiliation with other companies. It is proposed to give service equal to if not better than that furnished by the old line company, and at a greatly reduced rate.

The Citizens' Telephone Company of Houston, Tex., is preparing to make extension of switchboard facilities and cables. In fact, part of the work is already under way. This is made necessary by the large number of subscribers already booked and others who are asking for telephone service. The company is also preparing to issue a new directory which will contain many new names.

In the Senate recently Mr. Proctor, from the Committee on the District of Columbia, reported the bill incorporating the Washington Telephone Company. He stated that he wished to report the bill "without comment."

The telephone line from Milton to Bedford, Ky., is said to be a certainty. The work of setting the poles is now progressing. Advices from Rochester, N. Y., state that the striking Bell Telephone linemen have succeeded in preventing the company from bringing in new workmen. Up to date sixty new men have been imported, but they have about all joined the strikers as soon as they learned the situation. The Rochester Telephone Company, an independent corporation, was recently organized there, and the linemen say they can get plenty of work with the new company. The rivalry between the old and new telephone lines is intense, and the strike may cripple the Bell people's service.

Major Boone, traveling superintendent of the Southwestern Telephone Company, was in Wharton, Tex., a short time ago on business connected with the extension of his company's system, and is reported as saying: "My company just now is paying particular attention to the coast section of the State. As fast as your railroad lines are built, we will follow them and in some instances go ahead. I am charged to hasten the work on a local exchange in Edna, Jackson County. We are putting in a long distance line between Gregory and Rockropt."

The directors and stockholders of the Hudson Telephone Company met recently in Jersey City and elected the following directors: Judge John A. Blair, William J. Davis of Kearny, Lewis Wood, Philip Martin, A. L. Angle, Henry C. Vance, Jr., Clement J. Walker, Edwin Brooke and Arthur W. Deas. About two-thirds of the whole stock was represented at the meeting. The company declares itself to be free and independent from the Bell Company and intends remaining so. The reports of both secretary and treasurer showed increase in both subscribers and receipts.

An important meeting of telephone men was held in Boston recently. There were present: Chas. J. Glidder, president of the Erie Telephone system; Wm. A. Jackson, president of the Central Union Telephone Company; Jas. E. Caldwell, president of the Cumberland Telephone Company; A. Burt, general manager, and F. F. Rozzelle, general counsel of the Missouri & Kansas Telephone Company; Arthur D. Wheeler, general counsel of the Chicago Telephone Company. Although nothing could be definitely learned as to the nature of the meeting, it is generally understood the independent telephone situation was carefully gone over.

The Pennsylvania Telephone Company at Reading, Pa., is placing 14,282 feet of cable in conduits, to take the place of overhead wires on a number of streets in that city. When these cables are all connected, the company will have about ten miles of underground cable within the city limits. The company has also commenced the construction of a line from Womelsdorf to Newmanstown, Pa. The latter will be connected with the Reading exchange on the pay station basis.

The Eric Telephone system made a gain of 2,939 subscribers during the month of May. The total number connected to May 31 was 123,711, and the number waiting connection 5,939.

The citizens of West Caton, in Steuben County, N. Y., expects soon to be connected with Corning, N. Y., and the rest of the world by telephone. Work has already been commenced on the line.

A decrease of 4,565 instruments in the net output of the American Bell Telephone Company for the month ended May 20 makes a decrease of 20,014 since December 1.

The telephone companies are having their wires placed in subways throughout the city of Yonkers, N. Y.

The Lineville Telephone Company of Princeton, Mo., has filed a statement showing increase of capital stock from

## TELEPHONE INCORPORATIONS.

The Indian Territory Company of New York, Philadelphia and Texas—to build railroads, telegraph and telephone systems. Capital stock, \$5,000,000.

The Missouri Interstate Telephone Company, Kansas City Mo.—to operate a telephone system. Capital stock, \$500,000. Incorporators: D. J. Dean, J. R. Crowe and L. C. Boyle of Kansas City; W. B. Hurst, C. W. Penniman and G. Hornaday of Fort Scott, Kan.

The Salamanca Telegraph & Telephone Cempany, Salamanca, N. Y. Capital stock, \$10,000. Incorporators: C. R. Gibson, L. W. Gibson, E. Bolard, C. S. Fish, all of Salamanca.

The Excelsior Telephone Company, Wills Point, Tex. Capital stock, \$6,000.

The Marion County Telephone Company, Marion, O. Capital stock \$50,000.

## COMMERCIAL PARAGRAPHS.

W. C. Sterling & Son of Monroe, Mich., the oldest cedar firm of to-day, report business in their line as being the best it has ever been. They are shipping telephone poles to all parts of the country, and have a well established business because of their filling their orders to please their customers They are also shipping cedar ties to several electric roads and have contracts for several hundred thousand. eleven sorting and manufacturing cedar yards in Michigan, they are always in position to get cars and rush shipments.

In the exhibit of the Ericsson Telephone Company at the Cleveland Convention, Room 215, Electric Building, we are informed they make a fine display of instruments, both imported and American patterns, made with Ericsson Talking Circuits and American wood work and magneto. Among the imported instruments is the portable testing set, of which we show cut, which is a very handsome set, and particularly adapted for use when extending lines or at terminal stations. They also show an imported metallic circuit switchboard, which we are told will be connected up so that connections can be made through this switchboard, and will enable their visitors to use their make of instruments. Among the installations of L. M. Ericsson & Co., Stockholm, Sweden, we give particulars of some of the larger,

ones as it will interest our readers, particularly as the Ericsson Telephone Company are U. S. A. representatives of the Stockholm firm. The largest single switchboard room in the world is located at Copenhagen, Denmark, and the board installed has a capacity of 10,000 subscribers. There is a second floor in which an additional board is now being operated, having a capacity of several thousand subscribers. In Sweden many thousand instruments are in use, and in Stockholm are several large switchboards, in the central (primary) exchanges, besides, numerous small boards in the smaller cen trals and in the outlying cities and towns In Bergen, Norway, is an exchange of 3,000; one at Trondhjem only partly (900) installed; Arendal, 400, ultimate capacity 1,000; Christiansand, two of 400 each, ultimate capacity 1,000 each; Drammen 600, ultimate capacity 3,000. In Helsingfors, Finland, is a large board, capacity 8,000. In Wiborgh, 3,000; Abo, 3,000; Wasa, 1,800; Tammerfors, 3,000; Bjorneborg, 1,000. In Holland are two exchanges, at Groningen, 3,000; Utrecht 3,000. In Russia Ericsson has a branch factory in St Petersburg. Among other installations there are Charkow, 3,000; Riga, 3,000; Kasan, 1,800; Libou, 1,000; Rostoff-on-Don, 3,000; Sebastopol, 1,800; Tiflis, 3,000. A new modern board for 5,000 numbers will soon be installed in Kieff. In England Ericsson has supplied the National Telephone Company a large number of instruments, also numerous multiple switchboards. In Africa three exchanges, respectively, Cape Town, 3,000; Port Elizabeth, 1,500, and Pietermaritzburg, 1,500. To the Australian Government Ericsson has delivered telephones in thousands for years. In Shanghai will shortly be installed a board of 5,000 capacity. At Alexandria, Egypt, one of 400, ultimate capacity 1,000. In Java one of 600, ultimate capacity 3,000. In Valparaiso, Chili, 800, ultimate capacity 3,000; Lima, Peru, 900, ultimate capacity 3,000.

## Minute Telephone Rates.

The Northwestern Telephone Exchange Company recently put in effect minute rates from Minneapolis to all stations on its lines in Minnesota and the Dakotas. A few months ago as an experiment a minute rate was made from Minneapolis to Fargo, Grand Forks and a limited number of other points in North Dakota, and the rate having proved popular, through reducing the cost of short time messages, it has been decided to extend it to the stations reached directly by the Northwestern lines. It is claimed that fully 75 per cent. of the business telephone conversations can be kept within one minute if the individual talking will measure words, observing brevity and confining the conversation strictly to business.

# GENERAL NEWS.

ELECTRICITY.

What is Going On in the Electrical World.

#### LIGHTING.

Adairville, Ky.—W. C. Potter of Memphis, Tenn., will prepare plans and specifications for an electric light plant for this city.

Ashland, Ill.—The citizers here have decided to erect a municipal electric lighting plant.

Astoria, Ore.—The question of building and operating an electric light plant is being discussed here.

Fairport, N. Y.—The citizens of this place voted a short time ago to install an electric light system.

Fairmount, W. Va.—B. K. McMechen, of Wheeling, has purchased from S. L. Watson and others the plant of the Fairmount Electric Light & Power Company, and proposes making an outlay of \$25,000 at once to increase its size and to care for the growth of the business. An electric road to be erected in connection with the increase its size and to a propose of the deal. this is said to be another feature of the deal.

Jefferson City, Mo.—The present contract for lighting the city expires in the fall and the council is preparing to enter into another contract. The city burns at present 38 arc lights, 2,000 candle power. Address A. P. Grimshaw, mayor.

Kansas City. Mo.—An ordinance has been introduced in the city council which provides for the issuance of \$125,000 in bonds for erecting or purchasing an electric lighting plant.—The Kansas City Electric Light & Power Company has arranged to have its electric light wires put underground. The work will be completed by September 1 at a cost of \$210,000.

Mount Ayr, Ia.—The people here are considering the advisability of installing an electric light plant.

New Hartford, N. Y.—This village is to have electric lights. The Utica Electric Light & Power Company has made application for a franchise here.

Oskaloosa, Ia.—This city is inviting bids until July 2 for lighting the streets for a term not exceeding 15

Pittsburg, Pa.—Plans for the new electric light plant to take the place of the present one are being prepared. None of the machinery in the old plant is to be used. Peoris, Ill.—H. W. McCoy. G. B. Franks and W. Barker are interested in the Hammond Gas & Electric Company of this city, which has lately been organized with a capital stock of \$10,000 to operate light, heat and power plants.

Santa Cruz, Cal.—J. F. Cooper recently established the Big Creek Electric Power Company at Big Creek, fifty miles north of here. The company's idea is to light not only this city, but furnish power and lighting

St. Cloud. Minn.-The electric light plant at the dam in this city is to be rebuilt at a cost of \$30,00

Verons, N. J.—At a recent election held here to decide for or against further lighting of the streets with electricity, the verdict was strongly in favor of the

Waterloo, Ind.—H. K. Leas, J. P. McCague, M. Kiplinger and A. Kelly are interested in a concern recently formed here, known as the Waterloo Electric Light & Power Company.

Waynesville, N. C —This city is considering the construction of an electric light plant for which bonds have been issued.

Winona, Minn.—It is understood that the Northwestern officials are planning to put in an electric light plant at the shops in this city.

# STREET RAILWAYS.

Cleveland, O — The Portage Lake Traction Company of this city was lately incorporated for \$10,000 by D. M. Glasscock, C. H. Nau, H. Lancefield and C. L. Stocker, to build and operate an electric line between here and Ravenna and Kent, Portage County.

Fall River, Mass.—A new electric railway is planned between Providence and this place. J. T. Shaw of Brookline, Mass., is the largest stockholder.

Harrisburg, Pa -Capitalists of this city are interested in a project to run a trolley line from Carlisle to Mt. Holley Springs via Craighead, Mt. Zion and Hatton.

Huntsville, Ala.—When the deal involving the transfer of the Belle Factory property to northern manufacturers is closed, the Nashville, Chattanooga & St. Louis Railway, which runs from here to that place, will be electrically equipped and electric cars will unite this city with its big suburb.

Lancaster, Pa.—William F. Sadler, Jr., secretary and treasurer of the Trenton, Lawrenceville and Princeton Railroad Company, was in this city a short time ago in the interest of a New York syndicate, which intends to erect a number of trolley roads throughout the county.

Libertyville, Ill.—The Secretary of State recently licensed the incorporation of the Chicago, Fox and Geneva Lakes Electric Railway Company, with its principal office here. The road is to be constructed from a point on the east line of Lake County, Ill., to a point in McHenry County on the State line between Illinois and Wisconsin. The capital stock is \$100,000.

The incorporators are F. V. Bissell of Oak Park, Ill., C. Cunningham, C. A. Hill, K. S. Holmes and A. A. Patterson.

Little Falls, N. Y.—The proposed electric road from this city to Utica has received new life within the past week. The Hon. Silas B. Dutcher of Brooklyn will make an attempt to finance the scheme.

Little Rock, Ark.—The Little Rock Traction & Electric Company will expend about \$100,000 in betterments, repairs, and reconstruction of a large portion of its lines. J. A. Woodson, president, 414 West 2d street, Fleming Building.

London, O.—The county commissioners have granted a 25 year franchise to the National Traction Company of Phoneton, Miami County, which will build an electric line along the national pike from Columbus to the Indiana line.

Milton, Ind.—An electric road may be built from here to Economy, through Cambridge City and Hagerstown. The new line will intersect the road to be extended from Greenfield to Richmond.

Newcastle, Pa.—The project of an electric line between this city and Youngstown has been revived by a company that has already secured the right of way almost the entire distance.

New York City.—The storage battery electric system is to be put into service on the Thirty-fourth street cross-town line of the Metropolitan Street Railway Company

North Creek, N. Y.—There is a report that capital-ists are considering the question of building an electric line to connect with the Adirondack railroad at this place, and extend through Minerva and Newcomb to Long Lake, Hamilton County.

Savannah, Ga.— The city council favors granting a franchise to the Vernon Shell Road Company to build its proposed trolley line in this city. Messrs. Twiggs & Oliver are the company's attorneys.

Scranton, Pa.—The Northeastern Railway Company, for which letters patent were recently granted in Harrisburg, is to build an electric railway between this city and Wilkes-Barre.

Toledo, O.—The Victory Park Railway Company was lately incorporated with \$50,000 capital, by Chas. W. Ryan, J. William Ryan, John D. Besey, Frank J. Buckle and Frank W. Coughling, for the purpose of operating an electric railway on Put-in-Bay Island.

Worcester, Mass.—A plan is maturing which may end in the establishment of a continuous electric street railway system from Putnam, Conn., to this city. The Webster and Dudley Company is connected with the

# MANUFACTURING.

Elizabeth, N.J.—A new concern, known as the Hercules Motor Company has been formed here to manufacture and deal in electrical apparatus. Among the incorporators are Charles G. Blies, William I. Hester, Brooklyn, and J. C. Warner, of Newark.

Newark, N. J.—The Electric Tripartite Steel Pole Company of this city, with a capital of \$100,000, was recently formed to manufacture posts for electric railways. Washington E. Page of Franklin, Samuel C. Martin and George V. A. Conger of Belleville are all interested in the concern.

Paris, Ky.—The Power Grocery Company is interested in a proposed street car line, and wishes to correspond with car builders and material dealers. H. A.

Trenton, N. J.—The Storey Motor Company is unable to secure the help needed to conduct its business here, and will remove to Harrison, N. J., as the company believes that it will be able to secure mechanics from New York when the works are nearer the metropolis. Last week its authorized capital stock was increased to \$3,500,000. The concern manufactures electric and pneumatic machinery, and has a large export trade. port trade.

# COMPANY MATTERS.

Boston, Mass.—Holbrook, Cabot & Daly of this city, have received the contract to build the new electric power plant which the Ludlow Manufacturing Company is to erect at Red Bridge.

pany is to erect at Red Bridge.

Shelton. Conn.—The Consolidated Railway, Electric, Heating, Lighting & Equipment Compus is a new corporation here, and is made up of a number of relatively smaller companies, which have consolidated and are as follows: Columbian Electric Car Lighting Company, American Railway Electric Light Company, United Electric Company, National Electric Car Lighting Company, European Railway Electric Lighting Company, Lindstrom Lever Brake Company, Railway Triplex Ticket Company and Syracuse Battery Company.

# POWER AND TRANSMISSION PLANTS.

Lockport, N. Y.—Charles E Dickinson, president of the Franklin Mills Company, purchased the old Chester mill site on Race street a short time ago, which is con-sidered one of the very best power sites in the country. In course of time it is expected to be transformed into an electrical plant from which power for manufactur-ing purposes, lighting, telephones, etc., will be sup-plied.

# **ECTRICA** SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of source The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltiu ore. The pref stock of U.R. & Eec. Co. has been issued in the form of income bonds. b Leased to B ston Elevated Railroad Company.

o Owned by Brooklyn Rapid Transit Company.

d Leased to B ston Elevated Railroad Co., which guarantees 10% on capital stock.

e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hst. Co. f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR. g Owned by Atlantic Ave. RR and leased to Nassau system.

A 300 per share on outstanding capital paid as rental by lessee—West Ohicago St. RR. Co.; \$250,100 of stock owned by North Chicago Street Railroad Company.

oontrols by lesse Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Company.

155 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company.

Majority of stock owned by Ohicago West Division Railway Company; \$20 on \$1,000.

Stock guaranted by West Chicago Street Railroad Company.

Majority of stock owned by Ohicago West Division Railway Company; \$2 on \$1,000.

On stock guaranted by West Chicago Street Railroad, assuming its bends.

\*Unlisted. † Full paid. | Outstanding. † Ex-div.
a Leased to New Orleans Traction Company at 5 % on stock.
b Leased to New Orleans Traction Company at 8 % on stock.
b Leased to New Orleans Traction Company at 8 % on stock.
c Leased to Central Crossfown Radiroad at 8 % on stock and interest on bonds.
d Operating the former Med. Trac. system, that corporation having become extinct.
c Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Ry.
f Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
i Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
i Leased to Metropolitan Street Railway for 18 % on stock
i Leased to Metropolitan Street Railway for 18 % on capital stock.

Controlled by Third Avenue Railway for 18 % on capital stock.
m Controlled by Third Avenue Railway for 18 % on capital stock.
c Controls by lease the Alleg'ny, Cent., Citizens' Duquesne, Fort Pitt & Pitt'h Traction.
p Leased to Consolidated Traction Company for 8 % per annum on ar value of stock.
r Leased to Consolidated Traction Company for 8 % on espital stock.
s Leased to Consolidated Traction Company for 6 % on espital stock.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 162@162c.; Lake, 162@162c.; casting, 162@162c.

Directors of the Commercial Cable Company have declared the regular quarterly dividend of  $1\frac{3}{4}$  per cent.

The first session of the Fifty sixth Congress ended at 5 o'clock on the afternoon of June 7. Congress will not meet again until December 3.

A director of the Union Traction Company of Philadelphia states that a conservative estimate indicates a year's surplus of \$1,000,000.

The Boston "News Bureau" states that the United Verde Copper Company is to day paying a dividend of 75 cents a share. This is an increase of 25 cents a share in the semi-monthly rate.

It is stated at the Calumet & Hecla office in Boston that the temperature at No. 2 shaft is down to about 76 degrees. It is believed that the fire is out. The shaft will probably be opened this week.

The latest quotations for some of the new industrial stocks, not given elsewhere are: Electric Boat, 18 3/20; New York Electric Vehicle Transportation, 8@8}, New England Transportation, 4@4½; Gramophone, 35@46.

The statement of the Metropolitan Street Railway Company of New York for the quarter ending March 31 showed gross earnings of \$3 268,260, an increase of \$418 356; net, \$1.715 824, an increase of \$313,557, and surplus after charges, \$729,398, an increase of \$221 847.

A certificate of reduction of the capital stock of the Postal Telegraph-Cable Company from \$1.000,000 to \$1.00.000 was filed with the Secretary of State at Albany last week. The amount of capital stock paid in is \$1,000,000. The debts and liabilities are less than \$5,000.

Wilson & Stephens of New York City offer to investors, at 102½ and accrued interest, 1.25 1,000 5 per cent. collateral trust gold bonds of the Eric Telegraph & Telephone Company, due January 1, 1929, interest payable January 1 and July 1. These bonds are part of \$2,000,000, \$750,000 having already been sold.

The Outario Light & Traction Company, the purchaser of the property and franchise of the Canandaigua (N. Y.) Electric Light & Railroad Company has been incorporated at Albany, N. Y., with a capital of \$100,000. Directors are J. Howard Burgess and Hubert C. Mandeville of Elmira and J. N. Purdee of Canandaigus.

The Brazil Electric Street Railway Company has been sold to John G. Bryson and J. N. Halsted, of Brazil, and Frank Edwards, of Indianapolis, Ind., for \$33,-750. The purchasers are agents for S one and Webster, the Boston men who are constructing the interurban line from Terre Haute, Ind., to Brazil, and who also own the street railway and electric lighting systems in that city.

The announcement is made that the A. M. Young syndicate of New York City, which has been actively engaged the past two months in acquiring New England roads, has acquired another trolley line in the Enfield & Longmeadow Railroad. The road is ten miles in length, and its capital stock is \$116,000, with a bonded debt of \$100,000 drawing 5 per cent. and payable in 16 years.

The stockholders of the Hartford Light & Power Company met recently and voted to dissolve. The directors of the company will make an application to the superior court under the vote of the stockholders to have the corporation discolved. The capital stock of the company was \$225,000, divided into 9,000 shares. All but a small portion of the stock is owned by the Hartford Electric Light Company, the stockholders have sold it at different times for \$10 a share.

A statement prepared by the Chairman of the Senate and House Appropriation Committees and submitted to Congress shows that the total appropriations made at the joint session of the Fifty-Sixth Congress amount to \$7.9,729,476, including \$131.247,155, estimated, to be on account of or incident to the late war with Spain. Deducting this sum, the total shows an increase over the year 1898, which immediately preceded the Spanish war, of \$49,747,242.

Capital stock of the Doylestown & Willow Grove Railway Company, operating in Pannsylvania has been increased, in compliance with requirements of the statute, from \$100,000 to \$500,000, and a mortgage has been executed to the Land Title & Trust Company of Philadelphia, trustee, for \$500,000 to secure an equal amount of first mortgage 4 per cent. gold bonds maturing 1933, in denomination of \$1,000 each, coupons payable semi-annually.

The Portland Trust Company of Portland, Me., has taken up the mortgage on the Portland and Saco electric road. The bonds were issued for refunding purposes and it is understood that the company is now controlled by the same officials who control the Portland Street Railway Company. It is thought that in a short time or as soon as the objections of the railroad commissioners can be overcome, the Portland Street Railway Company will extend its line to Saco and Biddeford.

The Grand Rapids Railway Company will extend its line to Saco and Biddeford.

The Grand Rapids Railway Company has acquired and now owns and operates all the street railway lines of Grand Rapids, Michigan, consisting of over 50 miles of single electric track. Its gross earnings for the year ended April 30, 1990, were \$486 161 as compared with \$42,332 for the previous year, and \$374 691 for the year before that. The net earnings for the year ended April 30, 1990, were \$215,208. The company has recently been authorized to issue \$3,500,000 5 per cent. bonds, and has issued \$2,500,000, dating them June 1, 1900, payable in 16 years.

A Philidalphia capitalist layed interested in the Floating Company of America.

A Phils delphia capitalist, largely interested in the Electric Company of America, says: "The company's position by the sale of its Long Island plants has been strengthened considerably. The sum received for the plants was two or three hundred thousand dollars in excess of the cost, and this profit which, added to the balance on hand to the credit of the profit and loss account, gives something like \$1,000,000 applicable to dividends. This amount would enable the company to continue the semi-annual dividend payments of 50 cents a share, or \$4°4,000 a year, for several years to come, even if the earnings fell scant of the required figure. In addition to this, the money received for the Long Island properties, will undoubtedly be reinvested in a way to increase the income."

The thirty-six properties of the Massachusetts Electric Companies with a total mileage of 759 miles have now been combined into fourteen companies and this number will probably later be reduced to seven or eight companies. The fourteen companies are: The Lynn & Boston Railway Company, Brockton Street Railway Company, West Roxbury & Roslindale Railway Company, Globe Street Railway Company, Newport & Fall River Company, North Woburn Street Railway Company, Taunton Street Railway, Hyde Park Electric Company, Quincy & Boston, Nashua Street Railway, Lowell, Lawrence & Haverhill, Lowell & Suburban, New Bedford, Middleboro & Brockton, South Shore & Boston.

A New York syndicate has purchased the La Salle, Ill., gas and electric light plant. The men who compose the syndicate are C. W. Morse, John F Carroll, Richard Croker, Robert A. Van Wyck, and others. The bulk of the stock of the concern has for several years been owned by New York parties. N. R. Wilson of New York negotiated \$104.000 worth of bonds, and is the concern's agent in the East. The Croker syndicate has secured to date the gas plants of Decatur. Kewanee, Galesburg, Peru, La Salle, Champaign, Urbana, and Peoria. Negotiations are in progress for others, and all are to be incorporated under one name, with a large capital stock.

# EDITORIAL NOTES.

The Cleveland Independent Telephone Convention.

For the fourth time in the history of the country the representatives of the various independent telephone interests of the United States were gathered togeth-

er to discuss the several phases of the independent telephone movement, and it is no exaggeration to say that the Cleveland Convention, which has drawn to a close, has done much in the way of cementing the independent interests in their fight against the common enemy, the Bell monopoly.

In spite of the fact that the independent telephone movement is, comparatively speaking, in its infancy, it has already accomplished wonders in the way of erecting lines and furnishing service at reasonable rates. According to Judge Thomas, who has examined carefully into the matter, there are at the present time, no less than 3,000 independent companies operating in all parts of the country. These companies have in actual service in the neighborhood of 1,000,000 telephone instruments, demand for which has been created within six years, at which time the independent telephone movement first saw the light of day. The Bell Telephone Company was, on the other hand, nearly twenty years in creating a demand for 582,506 telephones. The reason for this is clearly set forth in a paper read at the convention by Mr. E. L. Barber, in which among other things he said:

"At the time of the advent of the independent movement had those who were in possession of the telephone interests of this country been disposed to be half way fair with the people the independent telephone movement would never have been born, and those of us who are here assembled to-day would never have had the pleasure of communing with each other, nor the experiences we have had since we engaged in this line of human endeavor. But they were not so disposed. They seemed to believe that they had everything their own way; that the telephone was invented only for the rich of the populous centers of our country, and by their acts of exclusion deprived nine-tenths of the population of our country the privilege of enjoying this greatest of modern improvements. The telephone is no longer a luxury to be enjoyed by the rich, but it has become an everyday necessity to the home, as the cook stove, and essential to the business office as the desk or typewriting machine."

Thus the success so far of the independent companies may be attributed to the fact that they are willing to furnish service at reasonable rates, or in other words, at a price that the man of moderate means can afford to pay. In short they prefer a small profit from the many rather than a large profit from the few. And this is as it should be, as such a policy cannot help but stimulate the demand which, while benefiting the producers or telephone companies, also redounds to the well being of individuals and communities by placing within their reach a device that has grown to be an everyday necessity.

In the struggle which is now waging between the independent telephone companies and the Bell monopoly one thing alone is to be feared, which would result in the death of the independent movement, and which was dealt with most ably in the paper read by the Hon. C. W. Kline. He said: "Let us pool our issues, wipe out our disagreements, stand heart to heart, shoulder to shoulder in an onward and upward march to telephonic perfection. Let the spirit of our sires fully imbue us with that old truth 'United we stand, divided we fall.'"

This advice is well worth heeding, and is the keynote to success.

St. Louis Strikers to Boycotting.

Negotiations to settle the big railway strike in St. Defeated Resort Louis have been started by the strikers. The bold stand taken by the citi-

zens and the Transit Company has forced the strikers to plead for reinstatement.

After weeks of internecine strife, where a body of men led by brainless leaders attempted to destroy the welfare of a large city, and did cause the loss to its citizens of millions of dollars and an untold amount of suffering and humiliation, we are informed by a dispatch from St. Louis that a proposition has been made to the Transit Company for "peace"that is, the mob element has been persuaded to stop chasing women and children through the streets and denuding them of their clothing, besides committing other shameless indignities, to quit firing shots at passing cars and maltreating the citizens generally-if the Transit Company will consider the following

proposition made by the strikers' executive committee:

"That no discrimination will be made against any employe because he is or may become a member of any union; that the company will treat with any committee representing the organization regarding any matter of mutual interest; that the company will agree that if any future differences shall arise between it and its employes with respect to the terms of agreement or its application to cases that shall hereafter arise which cannot be adjusted amicably between the parties, they shall be submitted to arbitration; that the question of the reinstatement of former employes shall be submitted to arbitration."

Of course the Transit Company will give the matter due consideration, but being "masters of the situation" it is doubtful if they will allow the strikers to dictate an agreement now that they have sufficient non-union men to run the cars. It is claimed that Mr. Samuel Gompers, president of the Federation of Labor, induced the hot-headed leaders to make the above proposition in order to draw out a reply from the Transit Company, and secure situations for some of the strikers.

Of course in all strikes like that at St. Louis the population generally side with the employes against the railroad company, but when professional rowdies take part in the contest and bombard cars with stones and other missiles, then the strikers lose the sympathy of the public, and they soon become convinced that they cannot oppose the majesty of the law.

If Mayor Ziegenhein of St. Louis had exercised his good offices as peacemaker when the trouble started, there is no doubt but a settlement could have been effected. Instead, however, he acted an ignoble part throughout, and to his vacillation is partly due the serious trouble that has been caused by the lawless element.

In New York and Brooklyn strikes of the same nature as that now existing at St. Louis were suppressed when violence was resorted to or men prevented from working who were anxious for employment, and considering the assaults constantly being made upon men usually not belonging to a trade or labor organization, like those now running the electric cars in St. Louis, it would seem opportune to recall a truth set forth by Justice Bradley of the United States Supreme Court in the famous slaughter-house cases. He first called attention to the fact that the Declaration of Independence lays the foundation of our national existence upon this proposition: "That all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these rights are life, liberty, and the pursuit of happiness." But these rights "are equivalent to the rights of life, liberty, and property." Justice Bradley then went on to say: "These are fundamental rights which can only be taken away by due process of law, and which can only be interfered with, or the enjoyment of which can only be modified, by lawful regulations necessary or proper for the mutual good of all: and these rights, I contend, belong to the citizens of every free government. For the preservation, exercise and enjoyment of these rights, the individual citizen, as a necessity, must be let free to adopt such calling, profession or trade as may seem to him most conducive to that end. Without this right he cannot be a free man. The right to choose one's calling is an essential part of that

liberty which it is the object of government to protect; and a calling, when chosen, is a man's property and right. Liberty and property are not protected when these rights are arbitrarily assailed." When, therefore, laborers or workingmen not belonging to any industrial organization are boycotted and forbidden to get their living in any honorable way that seems best to them, then we have a violation of what Justice Bradley most properly called "the foundation of our national existence."

Since the above was put in type a dispatch from St. Louis says that the Transit Company has refused to comply with the strikers' proposition and the latter have declared a boycott on the company's lines—the "old gag" before seeking another job.

\* \* \*

# Electricity for the Elevated Roads.

Some two or three years ago it was announced with a great blare of trumpets and the use of a large amount of printer's ink that the an-

tiquated equipment of the Manhattan Elevated Railway in this city was to be replaced by an electrical method of train propulsion. This announcement, although not positively contradicted by the officials of the company, was, as it turned out, premature, for although several years have gone by, the patient and resigned citizens of Manhattan Borough are still being drawn to and from their places of business by oil-dripping and smoky locomotives, which precludes dwellers along the lines from opening their windows in summer for fear of being asphyxiated.

Probably in no other city of the world would the unsanitary and unsatisfactory conditions that have maintained on the elevated roads of this metropolis have been allowed to exist so long. Fortunately, as the old saying goes, "It is a long road that has no turning," and the bend is now apparently in sight, for at a meeting of the executive committee of the Manhattan Elevated Railway Company last week resolutions were passed that would seem to augur the early carrying out of the plan which has been dangled before the New York public for the past two years.

First, the committee approved contracts for the machinery of the new power house at Seventy-fourth street and the East River. This comprises eight 8,000 horse-power engines, the necessary boilers and electrical generators and apparatus. The machinery will begin to arrive the first part of next October, when the power house will be about completed. The central station apparatus involves, so it is claimed, an expenditure of about \$3,000,000. Referring to the progress made in the construction of the central station Mr. George J. Gould is reported as saying:

"The excavation of the power house site in solid rock is completed, and the concrete foundations for the building are well under way. The structural steel for the building itself, which is 200 feet by 425 feet, will arrive on the ground and its erection commence not later than July 1. In fact, there only remains the exterior walls to be contracted for, which will be done at our next meeting, so that that work can commence on July 1, concurrently with the erection of the iron work."

At this same meeting the final report of the company's experts on the question of car equipment was also considered. After going over the matter, the committee directed the adoption of what is known as the double-end

system, i.e., a motor car on each end of a train, equipped with four motors each. These motors will be of about 100 horse-power, or 800 horse-power to a train, which is about four times the power of one of the locomotives now in use. During the day, trains will consist of six cars, while at night, one, two, or as few cars as desired may be run. The cars will have wider doors and platforms than those in use and will be lighted by incandescent lamps, which will certainly be a great improvement over the dim, ill-smelling oil lamps now doing service.

[Vol. XVIII., No. 24.

Another proposition acted on by the committee at its meeting was the placing of electric elevating stairways at some of its stations. Contracts were approved for the erection of such stairways at Fifty-ninth street and Third avenue, and Twenty-third street and Sixth avenue. Different types of elevating stairs will be tried, and whichever seems most desirable will be made use of at other stations.

The work of changing the motive power will begin on the Second Avenue road first, as this line is nearest the new central power station. The work, according to Mr. W. E. Baker, the chief engineer, cannot proceed very rapidly, as the laying of the third rails, etc., will have to be accomplished without interrupting traffic. Nevertheless it is claimed that electric trains should be running on this line by February, 1901, which means that lines on the west side of town, such as the Sixth avenue, and Ninth avenue, will probably not be equipped electrically until well on toward 1902.

# UNDER THE SEARCHLIGHT.

### Notes and Comments on Various Topics.

THE Union Safe Deposit & Trust Company of Portland, Me., recently contracted with the Bankers' Electric Protective Company of New England for the new electric protective system for its vaults. The system will be installed immediately.

THE "Pall Mall Gazette" of London says that the difficulty of sending messages by wireless telegraphy which shall not be legible by the whole world seems to have been solved by a most ingenious device presented by M. Tommasi to the Academie des Sciences at their meeting of last week. He uses at the sending station not one, but two transmitters. One of these transmits the real dispatch by the usual code, while the other sends only a series of meaningless dots and dashes produced by a mechanical process. The range of this last transmitter is kept always rather less than the other, so that at the receiving stations only the code signals will be received. If, however, an attempt be made to intercept the signals by means of a receiver interposed between the sending and receiving stations, both the real message and the meaningless clicks will appear together, with the result that the message will be utterly unintelligible.

Probably there is no class of men better prepared to withstand a sudden shock or a genuine surprise than the legal gentlemen employed by the electric railroad companies in Greater New York, accustomed as they are to listening daily to "hard luck" stories of accidents and "hairbreadth escapes from the deadly trolley car," but they must have been jarred when they learned that a New York man has made application to the Supreme Court to have set aside a verdict for \$3,349.50 secured by him

two years ago against the Third Avenue Railroad Company for injuries received in a collision. He says he is not entitled to the money, and that, moreover, he is about to die.

An electrical plant will be operated in connection with the Oconee cotton mills, at Seneca, S. C.

THE June 16 issue of the "Railway and Engineering Review" of Chicago, gotten out on the occasion of the Master Mechanics and Master Car Builders' Convention at Saratoga, deserves special mention. It is replete with handsome photographs of mechanical officials, and will undoubtedly be kept and frequently referred to in the years to come. This special issue in its way is a work of art, and should be in the hands of all persons interested in mechanical enterprises.

THE Saginaw Southern Electric Railroad, which is to be built from Saginaw to St. Charles and Durand, Mich., will touch about a dozen coal mines now in operation with about as many more contemplated, and it is the intention of the company to haul coal over the road. By this means it is said that the cost of hauling can be slightly reduced as against the present rates charged by the steam roads. The line will also be used for hauling sugar beets from the farms along the line to the factories in Bay County.

VISITORS to the Paris Exposition have been warned that they must guard against injury to their timepieces when they inspect the remarkable exhibition in the Palace of Electricity. This feature of the great fair is certain to be very popular, for the practical application of electricity to everyday uses is too recent a development of science to have lost its novelty, and the exhibition includes everything needed to illustrate the pregress of electrical discovery and the present uses of electricity in the arts and industries. There are large and small dynamos by the score developing the subtle current, and there are parts of the building into which watches cannot be carried without paralyzing their internal functions. In other words, the intense magnetic force developed is all pervading and magnetizes any steel that comes within the range of its influence. Watches stop entirely or work so poorly that they are useless. One of the Paris newspapers records the affliction thus visited upon the fine chronometer of Dr. Luys, whose watch was put out of service within five minutes after he entered the Palace of Electricity.

WILLIAM A. EDDY of Bayonne, N. J., found in a recent experiment that about three-quarters of the electric force which came down his kite-sustained steel wire was absorbed by the woodwork of the reel from which the wire was paid out upward. The sparks, with a six-foot kite floating at a height of 800 feet, were only one sixteenth of an inch in length, indicating that no storm was within many hundred miles to the north and westward. Mr. Eddy has long suspected that the woodwork of his reel was dissipating a good deal of electricity, in spite of the fact that dry wood is known to be a good non-conductor. He cut his kite wire and fastened the two ends together with silk cord which had been supplied by the Smithsonian Institution for reaching a great altitude with kites. It was found that electricity was unable to jump the gap filled in by the silk cord, but when a long iron rod which had been driven in the ground was made to approach the charged wire above the silk cord, half-inch sparks and one-inch discharges instantly appeared. During the afternoon in which the experiment was made little electricity was drawn from the upper air, and Mr. Eddy said there undoubtedly was no thunderstorm in the Southern States, since these always affect the wire with much greater intensity than

It is stated that the International Cable Directory Company has issued a telegraphic code and international cable directory, which is one of the most complete of its kind ever issued. In addition to the directory feature, its usefulness is greatly added to by the fact that it will be found in the offices of the Western Union Telegraph Company, and that it will be accessible in all parts of the world. The book has been adopted by the United States War Department, by the United States and Canadian Commissioners to the Paris Exposition, by the Canadian Government, and by about 11,000 banking, mercantile, and manufacturing concerns throughout the world.

THE "Elektrotechnische Rundschau" describes a new form of arc lamp which has recently been patented. It does not consume carbon rods like the ordinary lamp, but maintains its arc between platinum surfaces in a vacuum. The lamp consists of a glass bulb, in the interior of which, in place of the customary carbon rods, regulated by more or less complicated mechanism, are two L-shaped pieces of aluminum pointed with platinum. The arc plays between these in a vacuum, the bulb being exhausted highly. It is asserted that regulation, or rather starting the arc, for it requires no regulation, is accomplished by a simple pendulum motion of the bulb. The lamp is said to be shadowless, and the incandescent portions do not wear out.

According to the "Dry Goods Economist" X-rays have found a new field of employment in the silk industry. They have already been used to select cocoons and enable the observer to ascertain, without opening the cocoon, if the animal inside is of the male or female sex. The eggs which the female carries contain enough mineral matter to be detected by the process. A German chemist uses the X-rays to determine whether silk has been "weighted," and to what extent. As the weighting is done in black silks with salt or iron, the presence of these is easily discernible, and this method of detection may be employed in addition to the more complicated analysis or in place of it.

A DISPATCH from Sante Fé, N. M., states that S. G. Burn, manager of the Galisteo Company, operating on the Ortiz grant, has made the official announcement that the new Edison process of extracting gold from gravel by electricity at a cost of but a few cents per ton of gravel has proved a success at the experimental mill at Dolores. The nature of the process is kept secret.

# The New York Electrical Society.

At the annual meeting of the New York Electrical Society on June 14 the following officers were elected: President, T. Commerford Martin; vice-presidents, Arthur Williams, F. V. Henshaw, Stephen L. Coles, W. C. Burton, C. O. Baker, Jr., and S. L. Nicholson; secretary, George H. Guy, and treasurer, Henry A. Sinclair.

# The Independent Telephone Convention.

Large Attendance at Cleveland and Great Enthusiasm—Judge J. M. Thomas Re-elected
President—The Next Convention Will
Probably be Held in New York City.

The Fourth Annual Convention of the Independent Telephone Association of the United States, which was held last week in Cleveland, O., was probably the most successful gathering of independent telephone men yet held.

By Monday night, June 11, over 250 delegates had arrived and almost every train reaching Cleveland deposited others.

The headquarters of the Association, Room 301, Electric Building, was thrown open at 8 o'clock Tuesday morning for the purpose of registering and issuing credentials to the delegates and visitors.

### FIRST DAY'S SESSION.

The first session of the Convention was called to order at noon on June 12 in a specially prepared room on the first floor of the Electric Building. The address of welcome was delivered by Mr. J. B. Hoge, Secretary of the United States Long Distance Telephone Company, in which among other things he said:

"It is my pleasant duty and honor to represent the Cuyahoga Telephone Company and the United States Telephone Company this morning and to extend to each of you a welcome to our city and to make our offices your home while in the city.

"Our long distance lines reaching most points in the cities of Ohio make connection with independent exchanges in the States of New York and Pennsylvania on the east, Kentucky on the south, Indiana on the west, and Michigan on the north, and within the next few weeks we expect to be able to make connections with West Virginia. I cannot help but feel confident of the independent telephone companies' future. I think this is especially true so far as Ohio is concerned and many other States of the Central West. If there are any delegates here who represent States that have not been so well organized and developed, I hope that before they leave this Convention they will have received enough enthusiasm and interest in the matter to have resolved to return home and perfect an organization that will develop their State or at least have matters so well along that there will be no question of its future by the time this Association meets at its Fifth Convention."

President Thomas responded to Mr. Hoge's address and said in part:

"We have not always had the pleasure of meeting at places where entertainment was given by the local people, with the exception of what has been offered in the city of Chicago and the city of Detroit by the people who were directly interested. The first year the people of Detroit kindly entertained the Convention, the second year the city of Chicago offered no entertainment; however, the third year (last year) the manufacturers and material people of Chicago kindly donated a large fund for the entertainment of this Convention. The enjoyment of that Convention has passed into history, all remember it, and those who were not there to enjoy it certainly have heard about it, no matter in what part of the United States they were. That being the first effort, we might say, at general entertainment, we thought it would be wise (I am talking now as

an Ohio man), we thought it would be well to invite the Association to meet on Ohio soil this year, the proposition was made the Association to meet in the city of Cleveland, that it would not be at the expense of the Association, but at the expense of somebody else, and so you are here. I am not going to make any pledges for the local entertainment and for the Cuyahoga and United States Telephone Companies: those who know how they do things know that pledges are unnecessary. If any of you who stay through the entertainment and through all the sessions of this Convention are not satisfied at the close of the banquet on Thursday night, please step to the doorkeeper and he will refund the money that it cost you for the banquet and your supper."

The session adjourned about 1 o'clock.

The first, second and third floors of the Electric Building were given over to exhibitors of telephone supplies and materials. Each exlibitor occupied one or two rooms, and many attractive exhibits were shown.

At 4 o'clock in the afternoon many of the delegates accepted an invitation extended by the American Steel & Wire Company to visit the plants of the company located on the lake shore. The company provided special cars for the occasion, and there was a generous response to the invitation.

In the evening the Cuyahoga and United States Telephone Companies gave a reception to the delegates and visitors on the seventh floor of the Electric Building. The directors of the companies and their wives received the guests. The rooms were a perfect bower of beautiful flowers and an orchestra rendered excellent music. The building was brilliantly lighted for the occasion. Refreshments were served. The opportunity of inspecting the plant of the Cuyahoga Telephone Company was afforde i the visitors. The reception lasted until midnight.

# SECOND DAY'S SESSION.

The second session of the Convention was called to order by President Thomas shortly after ten o'clock on Wednesday morning, June 13. Judge Thomas delivered his annual address, which was in part as follows:

"We find since the last annual meeting, that the entire property of the American Bell Telephone Company has passed into the hands of the American Telephone and Telegraph Com-The organization of the Telephone, Telegraph and Cable Company of America, with offices in the city of New York, has attracted more attention in the telephone world than any single organization within the past

"There are now less than two and one-half million telephones in operation in the United States, counting both the Bell and independent systems. We believe that the present population of the United States will use 7,000,000 telephones at reasonable prices.

"The Bell Telephone Company were nearly twenty years in creating a demand for 582,506 telephones. Since the beginning of the independent telephone movement six years ago, nearly 2,000,000 telephones have been added to this number. It will take at least \$700,000,000 to install all the telephones that our present population requires.

'If the Bell licensees were not hampered by the short-sight d policy adopted in the bcginning of the American Bell Telephone Company, their companies would have advanced to a position that would have been almost impregnable before the independent telephone companies were permitted to enter the field , the past with the telegraph and mail service, by reason of the expiration of patents.

"The telephone business could not exist as a natural monopoly, but only existed as a monopoly as long as the laws of this country said the products of the genius of man should be protected. No business has ever thrived long as a monopoly without Government protection, until by perfect organization the thing has been placed within the reach of the people at prices below those that could be made by opposing companies.

"It is hard to comprehend that in this short time more than three thousand independent telephone exchanges have been out into organization, and that nearly one million telephones are now operated by independent telephone companies.

"If the conveyance of intelligence by wire is to be owned and controlled by one organization, let it be under the policy adopted by the independent telephone men of this country."

Following the address of the president, J. B. Ware, of Grand Rapids, Mich., general manager of the Citizens' Telephone Company of that city, read an interesting paper on the subject "Toll Line Traffic." Other papers read were as follows: "Telephone Development," Ed. L. Barber, president of the Northwestern Telephone Construction Company of Wauseon, O.: "Telephone Investments," Hon. Hugh Dougherty, president of the United Telephone and Telegraph Company of Bluffton, Ind.; "Our Duty to One Another," Hon. C. W. Kline, president of the Interstate Telephone and Telegraph Company of Philadelphia; "Telephone Construction," James E. Stewart, consulting engineer of the Telephone, Telegraph and Cable Company of America, of New York.

Mr. Dougherty's paper on the subject of "Telephone Investments" was addressed to investors principally and also to telephone companies and the public generally. He said in part: "I think all fair-minded men will admit that the telephone completes the triune of business necessities, viz., the mail, the telegraph and the telephone; the three great means of transmission of thought; the three giants that have annihilated distance.

"By means of the mail we may write our letter in secret, seal it up and post it, assured that no one may know its contents except the one who receives it. I consider this of vital importance to the future of the race; for if love-making were to cease by means of the mail, many a fellow, being too poor to pay the railroad fare to visit his best girl, would be shut out, as he would not dare to trust his love secrets to the average telegraph or telephone operator. This important feature of the mail service, together with the low rate of postage, insures its continuation.

"The telegraph is a necessity also for quick transmission of such business when a record is necessary, which may be used in the courts, and for the regulation and control of the movement of railroad trains.

"This insures the future use of the telegraph: while the telephone, the last but not least in the great triple alliance of contributors to the benefit, comfort and pleasure of the civilized world, takes the place to a great extent of both the other two, and at the same time affording many advantages possessed by neither the mail nor telegraph. This should satisfy investors of the necessity and of the permanency of the telephone.

"I think fifty years hence, as it has been in

the sphere of the telephone will be widened to an extent not dreamed of to-day, and all those who invest their money will be perfectly safe as far as permanency, stability and satisfactory profits are concerned."

The meeting adjourned shortly before 1 o'clock

In the afternoon the ladies attending the Convention were given a tally-ho ride through some of the parks and boulevards, with the compliments of the Williams-Abbott Electric Company. Unfortunately the weather was inclement and the ride had to be curtailed.

During the afternoon the exhibit rooms were thronged. The Convention was a profitable one for the manufacturers and material men. Many large sales are reported and negotiations for many more have been opened.

In the evening the visitors, delegates and ladies were pleasantly entertained at Haltnorth's Garden, the Cleveland Electric Railway Company furnishing special cars to and from the Garden.

#### THIRD DAY'S SESSION.

The meeting was called to order by President Thomas at 10 A.M. on Thursday, June 14. The following officers were elected for the ensuing year:

President—J. M. Thomas, Chillicothe, O. First Vice-President—Col. H. C. Young,

Columbia. Pa.
Second Vice-President—C. E. Stinson, Rochester. N. Y.
Thir I Vice-President—H. E. Teachout, Des Moines, Ia.

Secretary and Treasurer-S. P. Sheerin, In-

dianapolis, Ind.

First Assistant Secretary—R. F. Johnson, Saginaw, Mich.

Second Assistant Secretary—S. E. Wayland, Wilkes-Barre, Pa.

The only other business transacted at the meeting was of a routine nature. The selection of a place for holding the next annual Convention of the Association will be made some time next winter by the executive committee, which is comprised of one member from each State represented in the Association.

Tax Association has invitations from Chiago, New York, Saratoga and Niagara Falls: New York City, it is generally believed, will be s:lected.

The meeting adjourned at 1 o'clock.

In the afternoon the delegates, visitors and employes of the Cuyahoga and United States Telephone Companies were entertained with a boat ride on the lake. This trip was taken advantage of by a large number of the delcgates and visitors. The boat left the dock at 2 o'clock and returned at 6 o'clock. There was music, dancing and refreshments.

On their return the delegates and their friends were met at the dock by a band and were escorted to the Colonial Hotel, where the

banquet was served.

Hon. Harry D. Critchfield, general counsel of the United States Telephone Company, was the toastmaster at the banquet. The programme of toasts was as follows: "Our Guests," F. A. Henry of the Cuyahoga Telephone Comp ny, Cleveland; "Why are we Here?" Edwin R. Sharp, secretary of the Columbus Citizens' Telephone Company, Columbus: "Frogs' Legs," Hon. E. B. Fisher, of the Citizens' Telephone emone Company of Grand Rapids, Mich.: "Sne ik Currents," Hon. Z. S. Holbrook, president of the Massachusetts Telephone and Telegraph Company, Boston: "Patent Rights and People's Rights," Hon. S. P. Sheerin, president of the New Long Distance Telephone Company, Indianapolis. Several therinformal toasts were responded to by different members of the Association.

# TELEPHONY AND THE UNITED STATES PATENT QEFICE.

#### BY A. F. TENNILLE.

A word that is unknown to-day becomes a familiar sound to-morrow; a fact that has been hooted at in one generation is as though it had always been existent in the following one, and in no one branch of every-day life is this more clearly exemplified than in the telephone. The word "telephony" was first used in the year 1861, during the course of a lecture delivered by Philip Reis, before the Physical Society of Frankfort. The first person to work out a practical demonstration of that idea was Bell; yet to-day the telephone is a matter not of luxury but of necessity.

The earliest workers of whom we have any authentic information are Bell, Gray, Edison, Dolbear, Berliner, Frost, Hughes, and a few others. Of these, Bell was the first to bring the telephone forward as a matter of commercial importance, but this movement was quickly followed up by others who worked in connection with and at the same time that he did, and it is rather difficult to state with absolute certainty as to whom we are the most indebted.

The earliest models on file in the Patent Office are those of the year 1878, and comprise those secured by Bell, Berliner, Edison, G. B. Richmond and J. H. Irwin, and of these perhaps the most interesting models are those of the Edison telephone circuits and of the Doolittle switches.

In the following year we find added to these the names of Short, Watson, Irwin, Randal Cook, Gillett, Gilbert, Gray, Fitch and others, and so on through the passing decades these names have been increased. Some of the old inventors have grown weary by the way, and their names have dropped out of the struggle for gain and fame, but some of the best and oldest are with us, still striving after the unattainable—perfection—and their work has been augmented by that of some of the master minds of the mechanical world, as represented in the closing year of the century, such as Blake, Gower, Lundquist, Ericsson, Keith, Smith, Freudenberg, Berditschwesky and others.

Among the early models to be found in the model room at the Patent Office are those of A. K. Eaton, for a voltaic transmitting telephone, in which was the combination of a contact pass and a slide resistance pass on a flexible elastic tube, the diaphragm being held in place by central pressure only; a planchette system of receiving, by J. H. Irwin; the Edison telephone circuits and the Doolittle switches, both of which are magnificent specimens of mechanical genius; a model of the Gower-Bell patent, issued in 1880; switchboards by Frost, Andres, Lane and Palmer.

Among the most noteworthy models is that for an acoustic telegraph for which a patent was obtained by Irwin, in 1879; it consisted of a brass drum on a wooden shelf, and was a transmitting telphone, encased in a jacket of soft rubber, or other non-resonant material, in order to prevent the disturbing effect of echoes or extraneous sounds, combined with electro-magnetic sound producing apparatus, and which was provided with a switch to be operated at will.

Carbon telephones have received a great deal of attention at different times, and many efforts have been made to overcome the effect of time upon the carbon, by which the sound is gradually blurred. One of these was pat-

ented by Gilbert, another by F. K. Fitch, consisting of a combination in the telegraphic circuit, of two carbon plates, with their respective faces in constant contact; one of these plates was in proper form to be thrown into vibration by the direct impingement of the atmospheric sound waves therein, and by its vibrations in constant contact with the other plate, causing variations in the area of the voice, in contact, and consequently causing corresponding variations in the resistance of the circuit, the whole being placed in a chamber with yielding or elastic lining, the carbon plates being secured therein with their faces in contact with each other. Both of these patents were obtained in 1878, and in the same year patents were applied for by Bell and Gray, the latter being a peculiar model, strangely resembling telegraphic instruments of the same time, as did nearly all of the earlier telephone models submitted. In filing his application for a patent, Elisha Gray filed a brief with the department in which he called attention to models that were being submitted and to his own inventions, showing that sounds and spoken words might be transmitted to a distance by causing the vibrations of a diaphragm to vary the resistance in the circuit. This both Bell and Gray proposed to do by introducing a column of liquid into the circuit, the length or resistance of which could be varied by causing the vibrations of the diaphragm to vary the depth of immersion of a light rod fixed to it and dipping into the liquid, and this idea has perhaps been the most fruitful of any modification of telephonic apparatus introduced. It is rather curious to note that Gray and Bell entered their application for patents within two hours of each other, with the difference in favor of Bell. In Grav's application the statement is made that the application is taken out for a method of generating and transmitting telegraphically, in an electrical circuit, rhythmical electric undulations or vibrations by means of a current produced in the primary circuit, including an electro-magnet by the vibrations of the transmitter, whereby a special induction coil was claimed to be dispensed with. It included the combination of a battery and an electro-magnet in the main line; the transmitting telephone arranged in short circuit shunting the battery and the magnet from the main line, the receiving telephone in the long circuit. and the switch which simultaneously and by a single movement disconnects the transmitting telephone, short circuiting the receiving telephone and closes the main line, thus leaving the line free for calls.

In the same year we find models of an electrical contact telephone by Berliner, and an Edison model of a carbon telephone, an electric telephone whereby the sound was carried by a diminution of the pressure of the vibrations and of the elastic diaphragm. Phelps has a model of a switch and lever for same, both of iron and very heavy; A. M. Roseburgh and G. Black are represented by models of the order of telegraph instruments, A. Paris and J. G. Lange by signaling apparatus, H. A. · House by elaborate switches; Blake, E. T. Quimby and E. F. Frost are represented by models of switchboards, and Blake, Crawford, Dolbear, and Russell by various forms of transmitters.

At the present time the Patent Office does not require a working model, every detail is expected to be set forth in drawings, and only in the event that it is required for an examination of some detail in order to see whether it is operative, or when there are certain parts that cannot be readily demonstrated by a drawing, is a model asked for by the office. These calls are very rare, and there has not been any special model called for in some time. The drawings and accompanying descriptions are usually so complete that they can be easily understood.

An interesting point in telephony just now is the board divided central, and the means of signaling the operator in charge of the station from a given point. This method is somewhat of a departure from the old method of centrally installed circuits and is giving satisfaction in Germany, and perhaps in Austria as well.

Again it is stated that the relays have been unusually active for the past year or two. It is evident that there is a necessity for improvement in the matter of relays, and an evidence of this is found in the fact that, not so very long ago, one of the large Western telephone companies offered a large sum to any one who should submit to them an operative relay; as yet this has not been secured, and it is more than probable that this is the cause of the present activity along that line.

There is some activity in the art of wireless telephony at the present time, but it is not yet proven to be feasible, owing to the large inductance of the electro-magnet and the receiving device, and the obstacle to its success is the want of an operative receiving instrument that will not permit of interference.

The automatic telephone has always been a matter of interest to those interested in telephony, as indicated by the early models looking to that end, some of them quite unique in their design: for instance, a signaling apparatus for an automatic telephone invented in 1880 by J. S. Ross, of Nashville, Tenn., another by W. H. Day, and an elaborate model by Geo. H. Bliss, of Pittsfield, Mass., consisting of an electro-magnetic system, by which one station or a circuit could be called to the exclusion of all other stations by means of synchronously adjusted clocks at each and all stations, which would permit an alarm to be sent to one station at a time, and at the same time it would also be possible to short circuit a line current from all of the alarm magnets excepting the one to be rung up; it consisted of a clock or time train, signal bell, and an electro-magnet, to be operated on a main electrical circuit, a short circuit, and the whole governed by the electro-magnet to be operated by a battery of sufficient power.

At the present time there is an increased activity in the automatic telephone, and it is somewhat a matter of surprise that there are not more being used in the large cities. There have been some large companies that have installed different automatic systems in certain cities in Kentucky and Ohio, but in the majority of cases where they have been introduced they have been forced out later on by the old line telephone exchanges. Yet it is claimed by those interested in the automatic that it is steadily gaining ground. Another peculiar fact is that the automatic system seems to be adopted far more readily by the foreign countries than it is in the United States, although it is not quite clear why this should be so, particularly as the automatic systems invented by foreigners are not nearly so complete nor so well made and finished as those turned out by inventors in the United States.

Among those who have secured patents on

the automatic telephone in the United States have been Lundquist, Ericsson, Keith, Smith, also Seligmann-Ulei.

The patents owned by Mr. Smith cover the percentage system of automatic telephones; this system has a certain number of connecting lines which are to be used when any subscriber is wanted, and there are means for selecting any particular connection which may not be in use.

Applications made for patents to the Patent Office show that the percentage system is in favor with American inventors and there is good reason for this, as it seems to combine cheapness with simplicity.

Divided centrals are often used in connection with the automatic systems, the automatic devices being connected through connections at a central, and this central in turn selecting either a second central or a calling subscriber.

Quite animated discussions are being carried on between experts representing different companies that put in the multiple board system, and those that put in the divided central system, with reference to the readiness or satisfaction that is derived by the general public through the relative merits of the two systems. There are to-day really only three different systems. The first, or what may be termed the common battery system, wherein the talking and the signal battery are one and the same thing and are located at a central station, the current being controlled by a condenser, a receiver, and a subscriber's station.

The second is known as the local battery system, wherein the talking battery is located at the subscriber's station and is generally connected up in series with the induction coil and the transmitter of the subscriber, a transmitter carrying the variations of current, which in turn carries the impression on the line which leads to the call station.

There is not, strictly speaking, a distinctive third system; but there are several modifications or combinations of those already named, each with some distinctive feature introduced by the inventor, evidently for the purpose of trying to convey the impression that he knows something.

In the central board system the subscriber's lines are connected by the opposite, or on a parallel with each other, and are also inductively connected together through an induction coil to the battery.

The crossing of tracks between connective lines in the common battery system is prevented by the use of what are termed "impedance coils," which do not allow the telephonic current to pass through the battery to any other lines than those for which they are intended. In this way a single battery can be used for any and all subscribers talking at the same time.

One of the remarkable patents that have been issued through our Patent Office is that for a thermal telephone, issued to Stanley, and it would look as though it might have been issued more on the ground of its peculiarities than for its practicability; and which is based on the essential principles governing the thermo-pile. The contacts are arranged in series with each other, so that any set of contacts may form a single surface, which may be either hot or cold, and thereby produce an electric current.

In the divided central system an important feature is the selecting a particular plug by the subscriber to be used by the operator in

making connection with a called subscriber, and is similar to that in which the operator signals to a second central to use a certain plug connected with a special plug.

One of the most important patents issued during 1899 was that to Keith and Ericsson, for an automatic. The instrument is placed in a vertical position on a board, and the particular working model submitted to the office covered a system for a thousand subscribers, each of whom would be his own operator. The call plugs were divided into sets of ten in a row, one hundred in each section.

By this use of the automatic system there is an entire absence of leakage through the central which is, to say the least, very annoying, and sometimes more. It is a fact that is practically unknown that, during the Spanish-American war, when there was such a sharp rivalry among newspaper men that all sense of honor, individual and State, seemed to be at a discount, that a complete automatic system was installed in the McGill Building, G street, in Washington, and the President and each of his cabinet officers were supplied with an automatic telephone at their residences, and thus, during the entire progress of the war, when so much transpired that the outside world was not made acquainted with until the proper time, the President and his cabinet were in constant and private communication: the only person having anything to do with the telephones being the electrician in charge of the system. It is stated that the system gave the most complete satisfaction to all the parties concerned.

The most important inventors of the automatic telephone at the present time are J. G. Smith, Freudenberg, and his competitor, Berditschwesky, Keith and Ericsson, who seem to be working in conjunction with each other. American inventors are in the lead in the patents which have been issued for telephones and their accessories. They are closely followed by the German, English and French, the French and German inventors are along the line of chemistry in its connection with electricity, while the English inventors are more along the line of instrument makers, in which they are said to be most successful.

The theory and manipulation of the induction coil are two fields that are still capable of very exhaustive treatment by those who are able and have the opportunities to carry on work along that line.

For very much that is of interest on the work of the present in the telephone line, as contained in the foregoing remarks, credit is due to Mr. Crampton, who has charge of the telephone branch of the electrical department of the Patent Office.

# Artificial Fuel.

Advices from abroad state that the British Admiralty is about to arrange for a series of trials of artificial fuel, the two varieties being Welsh bituminous coal residuum bound with pitch or tar, and the other a mixture of anthracite coal and highly bituminous matters with tar made up into blocks of 22 lbs. each. A separate series of trials are to be made at different speeds, and with both natural draught and forced draught. There is a great disadvantage however in both kinds of fuel over ordinary anthracite coal, namely, that they produce intense volumes of black smoke. Ordinary anthracite is smokeless, but has the disadvantage that no one has hitherto been able

to form it into briquettes. A process has, however, now been worked out at Swansea, England, for making anthracite briquettes with the admixture of bituminous coal and the like, and a plant is about to be put down for turning out half a million tons a year.

# GOVERNMENT TELEPHONE SCHEME FOR LONDON.\*

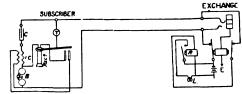

#### ((oncluded from page \$59)

The ducts will be built in cement to any required number and in different groupings. After a trench has been excavated to the required depth, 6 inches of concrete will be laid. in the center of which will be embedded one or two T-irons, according to the number of ducts in the group. After this concrete bed has set, the first tier of ducts will be laid, bedded in about half-an-inch of cement, and above this the second tier will be laid, also bedded in half-an-inch of cement, and so on for every subsequent tier till the nest is complete. On each side of a group of conduits there will be a wall of concrete, and above the top tier a layer of concrete. These side walls and the top layer of concrete will vary in thickness from 4 to 7 inches, according to the number of conduits in a trench.

In all cases these ducts will carry the main cables as distinguished from distribution cables, which will be branched off from the main cables at jointing chambers into cast-iron pipes.

#### JOINTING-CHAMBERS.

Jointing-chambers, or manholes, as they are more commonly termed, will be of two classes,

C, Condenser; 1C, Induction Coil; B, Bell; T, Transmitter; Recr., Receiver; R, Calling Relay; L, Calling Lamp.

Fig. 4.

one class for the roadway, and another for the footway. Roadway manholes will be larger, and constructed in a more substantial manner than any similar class of work yet attempted in this or possibly in any other country. They will be built of 14-inch brick-work in cement, roofed with steel troughing and steel joists, and the manhole entrance will have a cast-iron frame fitted with wooden blocks. The dimensions will vary with the number of cables to be brought into a manhole, but three standard sizes will be 4 feet wide, 8 feet long and 5 feet 6 inches deep (to take 18 cables); 5 feet 6 inches x 8 feet x 6 feet (to take 28 cables); and 7 feet x 8 feet x 6 feet (to take over 28). For the city work the last named will be the most common size used, but there will no doubt be some special manholes of larger dimensions.

The footway manholes will be of 9-inch work, with York stone roofs resting on light steel joists, with the ordinary cover frames with stone slabs. The dimensions of this class of manhole will be considerably less than those for roadway work, and will be governed more by the space available than by the number of cables.

The large manholes in roadway and footway are for the main cable work, and are to be built at an average distance apart of 150 yards, but of necessity the intervals between the

<sup>•</sup> From the "Electrical Review," London,

manholes in the city will be much less in many cases. These main jointing-chambers, when they are in the roadway, are to be connected with each footway, and when the manhole is in one footway it is to be connected with the opposite footway. In both cases the connection will be made by means of cast-iron pipes.

These connecting pipes will contain the cables which are to be used for distribution purposes, and which will be carried along the footways in cast-iron pipes. At intervals depending on the number of subscribers on the various routes small boxes will be fixed in the footway, and from these the cables or wires to serve subscribers will be carried into the buildings.

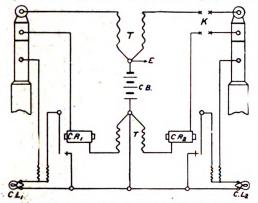

#### SWITCHBOARDS.

The switchboards for the Central Exchange will be fitted to accommodate 10,000 subscribers, whilst the switchboard for what may be termed the "inner" sub-exchanges, such as Westminster and Kensington, will have a capacity of 2,000, but will be so constructed as to admit of their being added to as business develops.

For the "outer" sub-exchanges the switchboards will, as a rule, have an original capacity of 600, but will be made so that additional "panels" may be added as required.

#### CENTRAL BATTERY SYSTEM.

The system of working to be adopted in the City Exchange and the inner sub-exchanges will be that known as the "central battery system." As the title implies, a central or common battery, usually 24 volts, is fixed at the exchange, so that no battery is required at a renter's office. This mode of working is especially adapted for large exchanges, where

T, Transformer; CB, Common Battery; CR<sub>1</sub>, CR<sub>2</sub>, Clearing Relays; CL<sub>1</sub>, CL<sub>2</sub>, Clearing lamps; K, Speaking and Ringing Keys.

Fig. 5.

secondary cells are available and where the subscribers' circuits do not exceed two miles in length. Under such conditions this system of working is very efficient. For the outer sub-exchanges and for long subscribers' lines the common battery system will be employed.

In central battery working the apparatus arrangements are such that when the receiver at the subscriber's end is on its hook the circuit there is not continuous, but is made through a condenser and magneto bell (this is to admit of a call being received), whilst at the exchange end the lines are joined together through a relay and battery. The action of lifting the receiver by a subscriber makes the circuit continuous through the speaking apparatus. This sends a current through the exchange relay, and thus causes a lamp to light, so gaining the attention of the operator automatically.

At the exchange the cords used for making connections have transformers joined across

them, the coils of these transformers being di vided at their middle points, and between the halves of the coils the common battery is placed. These transformers and the common battery thus respectively take the place and fulfill the function of the induction coil and battery which are required at the subscriber's end for the speaking circuit in the ordinary system of working. In the common battery system there is still an induction coil in the subscriber's telephone set, but its function is a "hearing," not a "speaking" one. ing "lamps are connected up with the cords in such a way that the act of replacing the subscriber's receiver upon the hook automatically causes a lamp to light, and the operator disconnects, thus restoring the subscriber's line to the normal:

ELECTRICITY.

Figs. 4 and 5 show diagrammatically the connections at the subscriber's end and at the exchange.

This system has been extensively adopted in the United States with excellent results. It has several advantages. The signaling is entirely automatic, and this reduces to a minimum the demand upon the time, patience and technical knowledge both of the renter and the exchange operator; the absence of batteries from the subscriber's office saves the space usually allotted to these articles, which are often looked upon as objectionable adjuncts to the telephone, and hitherto tolerated simply because they have been considered indispensa-Further, as the majority of faults at the subscriber's end are at present found to be in the battery circuit, the subscriber will be less troubled by visits from a lineman, and, incidentally, it may be remarked that this means to the Post Office a saving in skilled labor and in battery materials.

#### RATES.

The Post Office telephone rates for London have not yet been published, but they will probably be based on the "toll" rate system already announced by the Post Office for the provinces, as against the "flat" rate system which has hitherto been in vogue in this country. The annual rental quoted by the Post Office for provincial towns is £5 to cover 500 free calls, with a small graded charge for calls beyond that number.

The toll system will obviously appeal at once to the small users of the telephone. It will undoubtedly, however, very shortly find favor with large users as well, for it will have a tendency to induce the renter, but more particularly his staff, to be more careful with "calls," Under the present flat rate system indiscriminate use is made of the telephone by all and sundry. Even the office-boy does his "little talk" by means of it. The result is that many business calls are postponed or canceled altogether, and the interests of the firm suffer in consequence. This has been borne out by statistics from America and Switzerland, which proved that with a flat rate system the percentage of "ineffective" calls greatly exceeded the number under the toll rate system which is now in vogue in both these countries.

In America it is found that more real business is done, and more expeditiously done, under the new régime, than under the old. It is, therefore, safe to assume that a system which has commended itself to the sharp business men of America, a country which is, by the way, at present much ahead of us in matters telephonic, will soon become popular with the commercial community on this side of the Atlantic.

# THE SAFETY SYSTEM OF ELECTRIC WATER-TIGHT DOORS

A modern sea-going steamship, whether battleship or of the merchant marine, would undoubtedly be considered unsafe if it were not provided with water-tight bulkheads, dividing its hull into several distinct compartments. Inasmuch as the ultimate efficiency of such water-tight compartments depends upon their integrity when an emergency arises, and as every bulkhead is pierced below the water line by one or more openings for entrance and egress, it becomes of the greatest importance to have these openings provided with doors that may be closed quickly, conveniently and surely.

Aside from doors operated solely by hand—and the inadequacy of these has been fully demonstrated—there are now known three methods or systems of power-operated doors: 1, hydraulic; 2. pneumatic; 3, electric.

Doors controlled hydraulically have been tried experimentally upon a United States crusier. These served to demonstrate very clearly the important advantages of a power

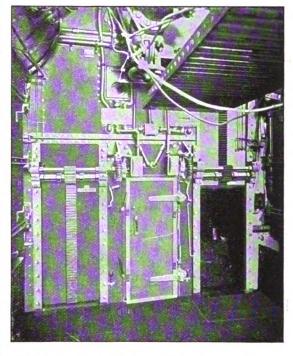

FIG. 1.—INSTALLATION ON U. S. S. ATLANTA

door, but owing to many difficulties inherent with the system, hydraulic control has been abandoned.

Pneumatic doors are now in an experimental stage. The difficulties attendant upon this mode of control are quite as numerous and as serious as with the hydraulic.

The electrically operated safety-door here described is the invention of Naval Constructor Francis T. Bowles, U. S. N., and is manufactured by the Sprague Electric Company of New York.

The safety system meets perfectly every requirement for a bulkhead door that has been outlined by authorities on this subject, or found desirable from experience.

First—The door can be raised or lowered by power or by hand, by one operator at the door on either side of the bulkhead.

Second—It will close either against a rush of water or against a rush of mixed water and coal, or through coal on the other door sill due to the first opening of a full bunker.

Third-It is possible to close by power from

the bridge, or from one or more central or emergency stations, any desired group of doors, or all the doors simultaneously, or in any degree of succession.

Fourth-There is at each emergency station a positive and reliable indicator by which the closure of each door is made known.

Fifth-The operation of the emergency closing in no way interferes with the local operation by hand or power.

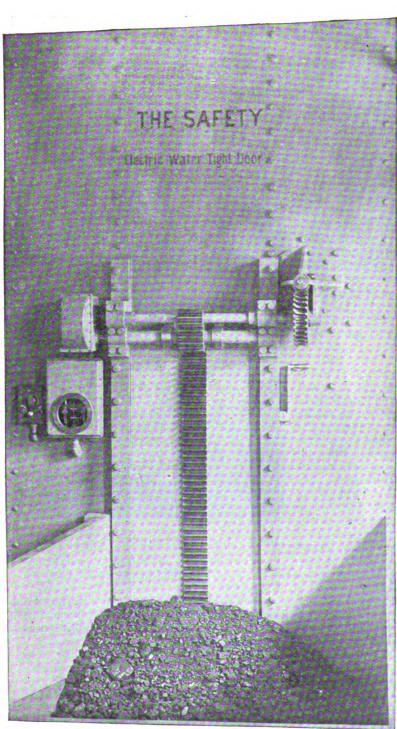

Eighth-The doors have no tendency to "creep," and will remain in any position without expenditure of power to hold them.

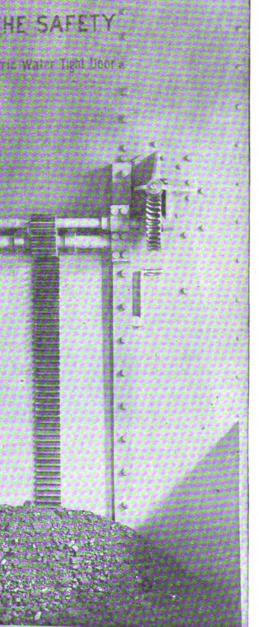

Ninth-The power is taken from the main generating plant of the ship, and requires no auxiliary central station or apparatus under continual and wasteful operation.

Tenth-There are no valves, springs or packng, which are subject to continual deterioration and require constant care.

frame, and all sliding parts and bearings, are bronze. The motor and controlling mechanism are enclosed in bronze water-tight cases which protect them from mechanical injury and from water. The driving mechanism occupies but little space, and the controlling apparatus can be so located as to avoid interference with other apparatus.

The sliding portion of the door is of steel plate, with bronze rim and rack. The frame

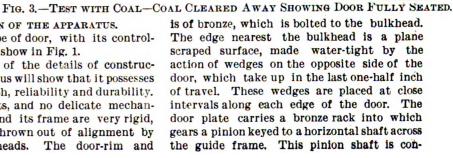

Sixth-The local control by power has pre-

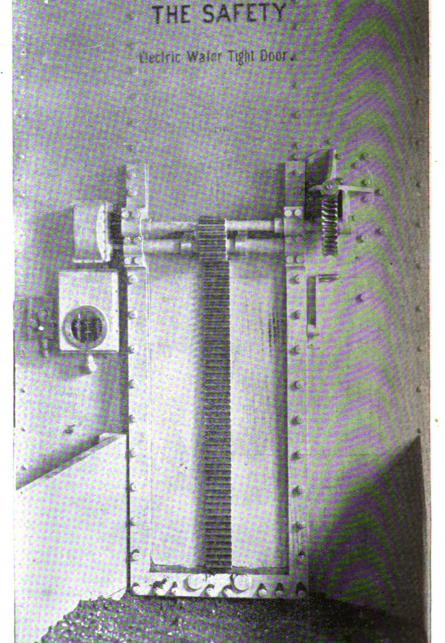

Fig. 2.--Test with Coal-Door Closed Through Coal.

DESCRIPTION OF THE APPARATUS.

The vertical type of door, with its controlling mechanism is show in Fig. 1.

A consideration of the details of construction of the apparatus will show that it possesses simplicity, strength, reliability and durability. There are few parts, and no delicate mechanisms. The door and its frame are very rigid, and will not be thrown out of alignment by warping of bulkheads. The door-rim and

cedence over the emergency closure, so that in-

dependent of such closure, a door may be stopped or opened for egress. After the local switch is released the emergency again assumes control and closes the door.

Seventh-The leads which supply power, and which control the doors as well as the operating mechanism, are unaffected by any temperature conditions existing on board ship.

nected through a worm wheel and worm to a shaft extending through the bulkhead, and upon which is mounted the motor armature. For hand operation, cranks are provided which ship over the hexagonal ends of the worm shaft on either side of the bulkhead.

The motor is specially built and wound, so that in ordinary use the power required to raise or lower the door is very small, but when the sill is covered by coal or other obstruction, it is capable of exerting a very powerful effort and will drive the door to its seat.

The controlling mechanism includes:—Controller, hand switch, automatic limit switch and emergency switch.

The controller consists of two magnetic switches which govern the circuits of the driving motor. The switches are closed electrically, and are opened by gravity when the current is cut off. One switch controls the upward, and the other the downward motion. The only moving portions of this controller are the solenoid "plungers," which carry solid copper contacts on flexible phosphor-bronze springs. These contacts make up against carbon blocks held in solid studs. All arcing when the motor circuit is broken is taken on these carbon blocks, which, as the carbon wears away from continued use, can be adjusted in their studs.

The contact with the carbons is independent of this wear, over wide range, on account of the copper contacts being mounted on flexible springs.

There are no pivots or pin joints, and no delicate springs or parts that require skill in adjusting.

The hand switch is a three-point switch operated by a shaft that passes through the bulkhead and carries a handle on each side. A movement of the switch handle to the right or left is all that is required to operate the door up or down. As long as the handle is held in one or the other position, the door continues to move. When released it is returned to its central position by a spiral spring and the door is immediately stopped. The contacts are simple and sure, and the handle is made especially heavy to withstand rough useage.

The automatic limit switch consists of two arms carried on a shaft which is connected to and driven by the main pinion shaft of the door. These two arms engage with switches which are opened, cutting off current and thus stopping the motor, when the door has reached its extreme upper or lower positions. These arms are adjustable upon their shaft so that the limits of motion of the door can be accurately determined when installed. After being adjusted, no further care is required.

The emergency switch, for closing the door from a distant point, consists of a standard push-button snap switch placed in a suitable case, which also contains the indicator. This is a small incandescent lamp, which, when lit, illuminates the circular glass "bull's eye."

All connecting wires from each electric fixture are brought to a central junction box, which forms a central station for connecting the circuits or testing them out. All enclosing boxes are fitted for receiving iron pipe connections.

## TRIALS.

A vertical door was erected in 1899 for trial tests at the Brooklyn Navy Yard. This was subjected to the most severe tests, extending over long periods, all of which it withstood most successfully. Without a particle of at-

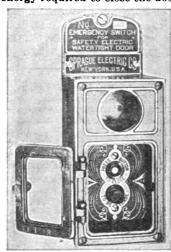

tention or adjustment, the door was operated many times a day for five months, and was closed many times through coal piled over the sill and through other obstructions.

Figs. 2 and 3 illustrate these tests. This same door, without any change or repairs whatever, has been sent to the Paris Exposition, at the request of and under the auspices of the U. S. Government.

After an exhaustive test and examination by a special commission appointed by the Secretary of the Navy, these doors were recommended for and installed upon the U. S. S. "Atlanta," where they are now in service. Installations have been made also on the S. S. "St. Paul" of the International Navigation Company and others are in progress and under advisement.

The power required to operate a single door will depend upon the speed at which it is desired to open or close. The following are power requirements for a vertical door arranged to open in 8 seconds and close in 9 seconds: To start the door down, 13 amperes or 1.43 kilowatts for ½ second; while closing, 3 amperes or .33 kilowatts for 8½ seconds; to start the door up, 18 amperes or 1.98 kilowatts for ½ second; while opening, 8 amperes or .83 kilowatts for ½ seconds—all at 110 volts.

The energy required to close the door is thus

EMERGENCY SWITCH FOR ONE DOOR.

only .978 watt hours, or about the equivalent of burning one 16-candle-power lamp for one minute. The total energy required to operate one door or a system of doors is, therefore, negligible in the determination of the size of the ship's dynamos.

The instantaneous demand for closing the the door at its start is, as per above test, 1.43 kilowatts, for one-half second.

The total instantaneous demand for a system of doors should not, however, be based on this figure. As the system can be so arranged that one or any number of doors are controlled by a single emergency switch, the best grouping for the given conditions is selected and the total power demand at any moment will depend upon the number of doors operated by a single switch. The maximum demand for power at any moment can, by suitable grouping, be made as small as desired.

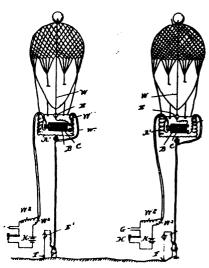

With a system of 12 doors, in which three doors are operated by one emergency switch, making four groups and four emergency switches, the total instantaneous demand of power would not exceed seven kilowatts when the emergency switches are closed at the rate of two per second, which requires very rapid movement on the part of the operator. This power is required for a period of but one-half

second, and the steady total load of twelve doors under these conditions is 3.96 kilowatts for eight seconds. Since each door must be opened individually by the local door switch, the power demand in opening can never be as great as when closing under emergency conditions. In special cases, where the power supply is so limited as to make it desirable, a special throttling device is provided which automatically and absolutely prevents more than a given rate of power supply to the door system.

The effect of this device is to extend the period of closure of the entire system and does not affect the power with which any single door will close, or the certainty that all will close.

# Wireless Telegraphy.

Patents on a system of wireless or space telegraphy were granted last week to Isidor Kitsee of Philadelphia, Pa., which embody several rather novel features, as may be seen by a glance at the accompanying illustration. What the

inventor lays claim to is "in wireless or space telegraphy, an automatic sending station comprising a buoy, a voltaic pile or couple adapted to be immersed in the sea-water, means electrically connected with said pile or couple for making and breaking the circuit at prearranged intervals, a primary coil and an interrupter in circuit with said pile or couple and said circuit making and breaking means, an aerial conductor, and a secondary coil in circuit with said conductor."

# CANADIAN NOTES.

(From our Ottawa Correspondent.)

Arrangements are on foot for the development of an automobile factory in Ottawa. A number of gentlemen from Toronto, Ont., interested in the enterprise, have been at the Canadian capital looking over the ground. The establishment will be the Canadian branch of an American firm engaged in the manufacture of these vehicles.

Prof. V. L. Emerson, the American scientist who discovered the process of converting sawdust and mill refuse into calcium carbide, and who is at present a resident of Ottawa, is now at work in that city on what he claims will be the fastest and most powerful automobile ever constructed. The machine will be operated by a hydro-carbon motor, that is by the explosion of gases made from liquid fuel. The steering will be done by an attachment to the rear wheels. Mr. Emerson has built a double cylinder motor, and he expects to develop between

thirty and forty horse-power. The weight of the automobile when finished, it is estimated, will be 1,100 pounds. The pressure at the point of explosion will be 380 pounds, and, with the machine he is building, Mr. Emerson will have gearing designed for a speed of 30 miles an hour. The gears will be made so that the automobile can be run either slowly or fast as desired. If necessary, Mr. Emerson claims that he can run the machine fully 60 miles an hour. The axles will be two inches in diameter, and, in addition to steel springs, a pneumatic spring which Mr. Emerson has invented will be used. The wheels will have rubber tires five inches in diameter with steel rims, and the wheels will be 36 inches in diameter. The reason for putting on such thick tires is to prevent roughness in running over the ordinary roads around the city. Mr. Emerson expects to have the automobile built in a few weeks, the motor being already available. The motor will be placed in the front of the vehicle and room for baggage in the rear will be provided. It is expected that the machine will run for a distance of 150 miles without recharging.

In connection with a London cable recently, in which it is claimed for the dentist Zierler (while experimenting at the Hygienic Institute at Wurzburg) the discovery of a successful application of electricity for the destruction of bacteria in the human system, the announcement is made that a Canadian physician, and a member of the profession in Ottawa, has been conducting for some time careful and original investigation into the influence of electricity in the cure of consumption, and quite independent of the announcement respecting Zierler. The practical results of these experiments will shortly be placed before the public.

## LEGAL NOTES.

Judge Kohlsaat recently appointed Charles Henrotin receiver of the Chicago Electric Traction Company, which operates cars beween Englewood and Blue Island, Ill. Mr. H inrotin has filed a \$25,000 bond.

Benson Bilwell, of Chicago, began suit a siort time ago in the Federal Court against the Indianapolis Street Rullway Company and the Citizens' Street Railway Company of Indianipolis, Ind., for \$50,000 damages for infringement of a patent. Mr. Bidwell is the holder of patents issued to him at Washington, May 26, 1885, which he claims cover every device used to day in the operation of a trolley ctr. He claims to be the original inventor of the trolley system and that he has been cheated out of his rights. The particular point upon which the present suit is based is the method used of lighting the cars from the same current by which they are propelled, which Mr. Bidwell claims is in direct infringement of his patent.

Judge Waddill, of the United States Circuit Court at Richmond, Va., upon application of the holders of \$393,000 of the \$400,000 first mortgage 5 per cent. bonds of the Richmond & Manchester Rilway Company, has lately granted an order appointing a receiver for that company.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended June 9:

Antwerp. 2 cases, \$15; 9 packages, \$2,993; Argentine Republic, 30 cases, \$1,914; Barcelona, 5 packages, \$110; Brazil, 169 packages, \$10,297; Bristol, 41 cases, \$4,500; 52 electric cable reels, \$6,945; British West Indies, 35 packages, \$111; Brussels, 1 case, \$418; Central America, 27 cases, \$714; Chili, 12 packages, \$449; Cuba, 26 packages, \$474; Ecuador, 1 case, \$37; Hamburg,

36 cases, \$1,260; Havre, 9 packages, \$985; Liverpool, 297 packages, \$23,392: 11 cases, \$1,380; London, 237 packages, \$16,799; Manchester, 6 cases, \$1,500; 7 packages, \$21,165; Margate, 8 cases, \$3,100: Peru, 12 cases, \$2,280: 13 packages, \$2,073; Porto Rico, 19 packages, \$377; Santo Domingo, 7 packages, \$444; Southampton, 2 packages, \$950; 75 cases, \$1,256; U.S. Colombia, 3 cases, \$71: Venezuela, 26 packages, \$53.

The following were the exports from the port of New York for the week ended June 16:

Alexandria, 32 packages, \$1,359; Antwerp, 33 packages, \$2,361; Argentine Republic, 74 cases, \$3,626; Australia, 93 packages, \$15,591; 97 cases, \$10,387; Brazil, 6 cases, \$292; Bremen, 10 cases, \$800; British East Indies, 28 packages, \$1,507; British West Indies, 16 cases, \$551; Brussels, 5 cases, \$240; China, 1 case, \$58; Christiana, 1 case, \$16; Cuba, 1 case, \$58; Ecuador, 26 packages, \$255; Florence, 10 packages, \$1,298; Genoa, 4 cases, \$94; Glasgow, 142 cases, \$20,124; Hamburg, 84 packages, \$5,753; 2 cases, \$13; Havre, 1 case, \$3,250; 152 packages, \$30,779; 6 cases electric carriages, \$7,250; Japan, 532 cases, \$33,229; Leipsic,8 cases,\$500; Lisbon,150 packages,\$9,034; Liverpool, 102 cases, \$14,052; 5 packages, \$156; London, 216 packages, \$30,307; 4 automobiles, \$1,200; Malta, 2 cases, \$36; Marseilles, 135 cases, \$11,515; Mexico, 34 cases, \$8,703; 12 parts of automobiles, \$2,525; Naples, 9 packages, \$1,200; New Castle, \$120; New Zealand, 1 case, \$112; 3 packages, \$68; Peru, 10 cases, \$420; St. Helena, 70 packages, \$1,015; Venezuela, 3 packages, \$51.

#### PERSONAL MENTION.

Mr. A. E. Waldron has recently accepted the superintendency of the electric light plant at Elmira, N. Y.

Mr. James Kent, general manager of the Canadian Pacific Railroad Telegraphs, left Montreal for the Pacific Coast a short time ago on an inspection tour, during which he will visit the principal telegraph offices on the system.

Mr. Charles Oliver, Government Railroad Commissioner of Sydney, New South Wales, is making a tour of this country, inspecting the railroad and electric street railway tems. He intends to purchase a complete electric light and power plant in order to duplicate plants now in operation in Sydney, Melbourne and other cities of Australia.

## INCORPORATIONS.

The Sayville Electric Company, Islip, N. Y. Capital stock, \$15,000. Directors; Daniel D. White, J. H. Green, Jr., Francis Gerber, Joseph A. Nauert and Sewell Thornhill, all of Savville.

The Massachusetts Power Company, Jersey City, N. J.-to supply electric power. Capital stock. \$750,000. Incorpora-R. M. Wiers, R. S. Checkley, K. A. Hammerer; R. M. Wiers & Co., attorneys, New York.

The Corporate Investment Company, Trenton, N. J .-- to manufacture and deal in all kinds of power and lighting, to build reservoirs and electrical apparatus, and operate railroads and canals. Capital stock, \$2,000,000. Incorporators: George Walbridge, S. Kingsbury Curtis, H. S. Collette, R. B. Marchant, George X. McLaughan and Charles L. Bartow, all of New York.

The Needham Electric Company, Needham, Mass.-te furnish electric light and power. Capital stock, \$15,000. Incorporators: W. W. Carter, C. H. Carter and F. B. Carter.

The Masontown Electric Light, Heat & Power Company, Masontown, Pa. Capital stock, \$10,000.

The Altha Automobile & Power Company of New York City-to make and deal in automobile goods and other kinds of vehicles propelled by electricity, steam or compressed air. Capital stock \$500,000.

The Standard Electric Light Company, Kansas City, Kan-Capital stock, \$25,000. Directors: L. E. James, W. J. Buchan, James Fennel, C. F. Holmes and W. E. Kirkpatrick.

The Shawmut Construction Company. New York City-to build and equip railroads and general electrical plants. Capital stock, \$150,000.

The Consumers' Electric Light & Power Company, Phillipsburg, N. J.—to deal in electricity. Capital stock, \$100,000. Incorporators: J. W. Cornell, H. S. Cavanaugh, W. H. Walters, all of Easton.

# ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solielton and Attorney for AMERICAN AND FOREIGN PATENTS, at 503 and 504 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents. Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 308-304 Broadway, New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payten cents. When ordering give name, date and title of invention wanted.

# GENERAL NEWS.

## What is Going On in the Electrical World.

#### LIGHTING.

Canon City, Col.—This city will have another electric light company. C. C. Conkle will be at the head of the concern.

Coffeyville, Kan.—The city council recently adopted a resolution in favor of circulating petitions calling a special election to vote \$20,000 in bonds to be used in putting in an electric light plant to be owned and operated by the city.

Concord, Mass.—It was recently voted by the citizens to appropriate \$16,000 for an electric light plant.

Eiroy, Wis.-An electric light plant will soon be put in at the roundhouse.

Goldsboro, N. C.-The Goldsboro Illuminating & Traction Company has applied for a charter and will build an electric light plant. Address A. H. Edgerton, secretary.

Grand Island, Neb.—The city council has decided to put in an electric light plant.

Lime Spring, Is — Electric lights are now assured for this place. Mr. S.fford will furnish the power from his mill on the upper Iowa River.

Lyons, Mich.—W. R Coates of Kalamazoo, has pre-pared plans and estimates for improving the municipal

mancos, Col.—This town has empowered its board of trustees to construct and operate an electric light plant for supplying the town and its irhabitants. G. Bauer, mayor.

Manistique, Mich. - H. Rose will install an electric light plant in his own store building.

Milan, Mich.—The village council has voted to light the streets by electricity. W. P. Lamkin has received the contract a d expects to have the lights in operation by Ostober 1.

Montgomery, Ala -Alderman Ruth has introduced a resolution into the council to erect a municipal electric light plant.

New Washington, O.-A. P. Miller is circulating a petition to secure an electric light plant for this plant

New Wilmington, Pa.—A new brick and iron electric lighting plant is to be built here under the supervision of J. G. Martin, secretary, who has the plans.

Niagara, Falls, N. Y.—The owners of the Niagara Falls Gas & Electric Lighting plant contemplate the erection of a new addition to it that will cost over \$50,000.

North Platte, Neb. — At a recent council meeting an ordinance was introduced for the construction and operation of a new electric lighting plant for the city. It is expected that W. M. Cunningham, president of the local water works company, will be chosen as the head of the new concern.

Paul's Valley, I. T. - An electric light plant is to be erected here.

Richmond, Ind.—The city council is preparing to erect a municipal electric lighting plant.

River Falls, Wis.—This city has voted bonds to the extent of \$8,000 for an electric lighting plant to be operated by water power. The cost of the plant will be about \$17,000.

South Bound Brook, N. J.-There is some talk of

having electric lights here in place of the oil lamps.

South Portland, Me.—The council has lately granted a franchise to the Consolidated Electric Light Company.

Talladega, Ala.—A. G. Story, chairman of the electric light committee at this place, desires correspondence relative to the establishment of a complete electric

Thorntown, Ind.—The board of trustees has decided to put in an electric light plant to be owned by the

Toledo. Ill. - A system of electric lighting is soon to be installed here.

Valdosta, Ga.—The Valdosta Electric Light & Power Company will expend about \$23,000 in improving and equipping its plant.

Williamston, S. C.—The Williamston ()il & Fertilizer Company is in the market for a complete electric light outfit.

Wolfe City, Tex.—A proposition to establish a system of electric lighting is under consideration here.

## STREET RAILWAYS.

Conneaut, O.-The Pennsylvania & Ohio Street Railroad Company will build an electric line from here to Ashtabula. B W. Baldwin, treasurer.

Eastport, Me. — The conditions for an electric street railway at this place are favorable.

Fond du Lac, Wis.—The Wisconsin Revid Transit Company was recently incorporated with \$25,000 capital stock by H. G. Smith, C. D. Smith and R. S. Wilkins. The company contemplates the construction and operation of an electric line,

Lewes, Del.—It is likely that a trolley line will be built from here to Rehoboth soon.

Lorain, O.—Another electric line is seeking entrance into this city from the west. Thos. Wood of Sandusky is interested in the scheme.

Miamisburg, O — There will be an electric line built from here to Germantown. Capitalists of both cities are the promoters. The road is now being surveyed.

Orlahoma City, Okla.—The Oklahoma Land & Electric Street Railway Company was recently organized in this city and capitalized at \$200,000 by Judge J. M. Lindsay of Gainesville, Tex. The company will erect an electric light plant and construct an electric street railway as soon as a franchise is granted by the city.

Russell, Mass.—The question of an electric line from this place to Blandford is being discussed again.

Springfield, Ill.—The Illinois and Rock River Railway Company was incorporated here a short time ago with a capital of \$1,000,000. The purpose of the company is to build a line of electric railway which will gridiron the northern portion of this State. Chicago capital is back of the enterprise, those interested being Ephraim Banning, Thomas Banning, T. C. MacMillan, A. F. Milliken and G. E. Plumb.

Terre Haute, Ind. — Preliminary surveys are being made for an electric line between this city and Morcm. Valdosta, Ga.—T. G. Crawford and B. W. Bentley are interested in the proposed electric line here and will soon make arrangements to purchase the necessary

#### MANUFACTURING.

rails and other equipment.

Charleston, W. Va.—A. F. Doddridge, M. M. Murry, R. E. Richardson, S. B. Cheever, L. R. Curry, all of Chicago, Ill., have lately organized a company here known as the Electric Security & Signal Company, to manufacture and deal in electrical appliances, on a capital of \$1.000, 00.

Chicago, III.—The Meridan Hydro-Carbon Arc Light Company of this city will manufacture electrical goods and appliances on a capital of \$25,000. The incorporators are F. A. Cody, R. bert D. Cody and S. muel Foster.

Clarksburg, W. Va.—The Pittsburg, Pa., Glass Company recently purchased eight acres of land here. This territory will be the site for a factory for the manufacturing of electric light globes.

Portland, Me. — The Van Electric Manufacturing Company was organized here a short time ago for the purpose of manufacturing and dealing in electrical supplies, with \$600,000 capital stock. The officers are: Precident, 8 F. Van Choste of Boston; treasurer, W. E. Sanford of Attleboro.

Syracuse, N. Y. — The Syracuse Arc Lamp Company was lately organized here. The lamp will be manufactured at the works of the International Heater Company in South Clinton street. The men at the head of the concern are Beardley N. Sperry and Liuis W.

## COMPANY MATTERS.

Diyton, O—A short time ago the Dayton & Troy Electric Railway Company elected the following directors: Charles B. Clegg, president of the Oakwood Street Railway Company; D. B. Corwin, president of the City Railway Company; Valentine Winters, president of the Dayton & Western Traction Company; J. M. Wilson and Harry P. Clegg.

Philadalphia P. The Wilmington and Paradania.

Philadelphia, Pa.—The Wilmington and Brandywine Springs Electric Bailway Company has elected as efficers: President, Robert C. Justis; vice president, Dr. L. H. Ball; treasurer, Thomas F. Barry, of this city; secretary, H. F. Dure, Jr; general manager, Richard W. Crook.

# POWER AND TRANSMISSION PLANTS.

Springfield, Mass —Lieut.-Col. F H. Ph.pps has been considering for some time the advisability of running the Hill shops at the armory by electricity. Enough water-power can be used at the water shops to generate the amount of electricity which would be required for

## MINES.

Baker City, Ore.—The Barnt River Gold Mining and D eiging Company is to build an electric plant to cost \$75,000. The plant will be 600 horse power, with full espacity for operating all of the mills, the hoists, and completely lighting the tunnels and shafts of the mine.

# AUTOMOBILES.

New Haven, Conn.—Negotiations are said to be well under way for the purchase of the New Haven Carriage Company and the Columbia Automobile Company of Hartford by the Electric Vehicle Company of New York

New York.—It is reported that a new corporation is to be formed with a capital of \$3,000,000 to take over the property of the General Electric Automobile Comy of Philadelphia.

washington, D.C.—The Metropolitan Railroad Company has added to its equipment a model modern wrecking wagon in the shape of an automobile, which was manufactured by the Riker Electric Company. It is fully equit ped for rapid running, as well as with the implements and appliances to repair damages to rear or reads. cars or roads.

# THE TELEPHONE WORLD.

# Directors of the Erie Telegraph and Telephone Company.

At the annual meeting of the Eric Telegraph and Telephone Company in New York City on June 12, a board of 24 directors was elected, which includes 11 who are directors of the Telephone, Telegraph & Cable Company of America, the rival of the I'ell Telephone Company.

These members were elected several weeks ago, at the time

These members were elected several weeks ago, at the time a controlling interest in the stock was picked up in the interest of the Telephone. Telegraph & Cable Company, while the leading Bell interests were apparently asleep, and most of the men were simply re-elected.

of the men were simply re-elected.

The so called "independent" men are: George Crocker,
Frank A. Cutting, Harrison W. Gawtry, William H. Gelshennen, William J. Latta, Martin Maloney, Charles W.
Morse, Daniel O'Day, Frank Tilford and Henry R. Wilson.

The other members, most of whom were re-elected, are Albert B. Chandler, Frank A. Cutting, Frederick A. Farrar, Wesley A. Gove, David S. Greenough and C. S. Tuckerman, of Boston; C. E. Adams, John C. Burke, C. J. Glidden, James H. Mills, James W. C. Pickering, Asa C Russell and Levi Sprague, of Lowell, Mass.; Harvey A. Whiting of Wilton, N. H.

The board of directors organized as follows: President, Charles J. Glidden, of Lowell, Mass.; vice presidents Charles E. Adams of Lowell, Mass., James P. McKinstry of Cleveland O., Heman J. Pettengill of Boston, Mass.; secretary, George B. Perham, of Lowell, Mass.; treasurer, Charles A. Grant, of Lowell, Mass; executive committee, William J. Latta, Martin Maloney, Frederick A. Farrar, Charles S. Tuckerman, Charles J. Glidden and Charles E. Adams.

This company was originally organized as a Bell concern, and it absorbed various Bell companies which had the exclusive right to use Bell instruments in certain territory. The Bell Company bound itself not to organize other companies in the territory in question.

For a long time the Bell Company is said to have retained

For a long time the Bell Company is said to have retained a majority of the stock of the Erie Company, but finally it was satisfied to let a portion of its holdings go.

The promoters of the opposition company—the Telephone, Telegraph & Cable Company—were quick to see their opportunity, and William J. Latta secured a majority of the Erie stock for the backers of the Telephone, Telegraph & Cable Company. His company now dictates the policy of the Erie although the Bell Company is allowed to retain the pres dency of the company.

The Erie will be an important feeder of the general lines that are brought together by the Telephone. Telegraph & Cable Company. The Bell Company itself is precluded from establishing a rival system in Erie territory, which embraces Michigan, Wisconsin Minnesota, Arkansas, Texas, Cuyahoga County, including Cleveland, O., and some other territory.

The recent success of the independent telelephone companies in obtaining charters at Tonawanda, North Tonawanda, Niagara Falls, Lockport and other towns in New York State, has increased the enthusiasm of the friends of the Buffalo Telephone Company, the projected rival of the Bell monopoly in that city Every day adds a long list of names to the list of subscribers. Said one of the directors recently: "We find that all classes of business men are heartily tired of the exorbitant rates and poor service of the present telephone company. Physicians and druggists are especially weary of the thraldom, and are of great assistance to us in our work of procuring names. Just to cite an instance, a member of an association of fifty members informed me the other day that every one of the fifty had been pledged to subscribe to the new company. We have not been paying any attention to the matter of a franchise lately. When the proper time comes we shall have the proper thing to say on the subject." It will take only six months to complete the plant and begin operations, from the time the work of construction has been commenced. It may be reasonably expected, therefore, that the people of Buffalo will be liberated from high telephone rates and poor service early in the coming year.

The New York & New Jersey Telephone Company offers to pay the city of Elizabeth, N. J., \$75 a mile for the use of streets in which to lay a conduit for its wires. The company also agrees to furnish the city with twenty-five free telephones for its official business, and to give telephone service free to the police department to all points within a radius of twenty miles of Elizabeth. The company asks for the franchise for a term of fifty years,

The annual meeting of the Nicollet County Telephone Company of Minnesota, was recently held at St. Peter, Minn., when the following officers were elected: President, C. C. Nelson; vice-president, M. C. Quist; secretary, A. L. Strauch; corresponding secretary, H. A. Burke; treasurer, Aug. Olson, directors, J. A. Poetz, H. J. Essler, A. L. Strauch, Aug. Olson, Joseph Wild, G. M. Cesander, H. A. Burke, M. C. Quist.

# An Independent Long Distance Service for Chicago.

Chicago will have an independent long-distance telephone connection with St. Louis as soon as the exchange of the Illinois Telephone Company is established in Chicago. This announcement was made recently in a positive manner by Dr. I. A. Lumpkin, president of the Illinois State Telephone Association.

In spite of the denials of President Wheeler of the Illinois Telephone Company that his company has any connection with the independent movement, Dr. Lumpkin says that the Illinois Company is as anxious as are the companies in the Illinois Association that the long-distance connections be made and all the independent companies in the State be united in competition with the Bell Telephone Company.

According to those best informed in telephone matters, there is no truth in the stories published recently to the effect that the franchise of the Illinois Telephone Company is for sale. The company is continuing the work of putting in the conduits to carry wires under the streets, and it is said that the title to its ownership is expressed in a single stock certificate deposited with a Chicago trust company. The capital for the construction was furnished by a St. Louis syndicate, with the agreement that no holdings could be sold until all were sold, which insures the completion of the system and the establishment of a rival to the Bell Telephone Company in the local field. It is said that the owners of the Illinois Telephone Company franchise are also the promoters of the Kiuloch Telephone Company of St. Louis, which is to furnish the St. Louis connections for the independent companies.

#### The Kentucky Telephone Association.

The Kentucky Telephone Association met in Winchester, Ky., recently. Fifteen independent companies were represented, comprising those of Central Kentucky and some from other parts of the State. The following officers were elected: David Prewitt of Pine Grove, president; A. H. Bastin of Crab Orchard, vice-president: W. W. Longmoor of Frankfort, treasurer; James Maret of Mt. Vernon, secretary; D. L. Pendleton, of Winchester, attorney; R. V. Bishop of Cynthiana, D. S. Baldwin of Richmond, and D. L. Pendleton of Winchester, executive committee.

Arrangements were made to connect the central and northern counties in the State by metallic circuits, and this work will be carried out this year. The lines of the independent companies will be pushed toward Louisville, Cincinnati, Knoxville and other large cities on or near the borders of the State. Uniform toll rates and metallic circuits on all lines will be insisted on, and a mutual interchange of business will be made, while the companies will still retain their present status of independence.

At the meeting of the Independent Telephone Association of Wisconsin, held recently at Madison, a resolution was passed that no member of the association shall sell an independent line to the Bell Company without first offering it to the association, or a member of the association. The matter of a combined trunk long-distance system was left in the hands of the executive committee to investigate and report. Six new companies were taken into membership, making a total of twenty five independent systems in the association, representing six-tenths of the independent telephone interests in the State of Wisconsin. The new companies are the Viroqua, Beloit, Eastern Wisconsin, Poynette, Troy and Honey Creek and Edgerton. The next meeting will be held in Madison the second Wednesday in February.

The Haverhill, Mass., "Gazette" has this to say regarding the refusal of the authorities of Lynn to allow the People's Telephone Company to do business in that city: "The refusal of the Lynn aldermen to allow the People's Telephone Company to do business in that city seems to savor of petty politics, and it will give rise to much unpleasant comment. The privilege to 'live and let live' does not seem to prevail in the city hall circles of our sister shoe city. It was poor politics to condemn the company wholesale until it had been given a fair trial, and it was ascertained if it merited such treatment."

The council of Junction City, Kan., has granted a franchise for the building of an independent telephone exchange. This means that Junction City is to be another link in the chain of independent exchanges that reaches out in every direction and covers nearly every town of importance in the State of Kansas. As an example of the extent of the independent telephone movement in that territory the three cities of Abilene, Manhattan and Salina have over 1,000 independent 'phones, and only 124 Bell instruments.

At a recent meeting of the stockholders of the Southwestern Telegraph & Telephone Company it was decided to increase the capital stock from \$7,000,000 to \$10,000,000,

# Telephone Wires Span the Connecticut River.

One of the picturesque mechanical features of the new series of long distance telephone wires from New York to Boston is the aerial span across the Connecticut River just north of Middletown. On account of the length of the metallic circuit it was necessary to avoid using a submarine cable for the reason that with a cable the efficiency of the circuit would be greatly impaired by reason of the capacity and induction in the insulating and protective devices, and also in the cable itself. "The Municipal and Railway Record" gives this description of the span: "The span is supported by two towers of structural steel at a distance of 1,300 feet apart, and carries now twenty wires, No. 8, B. W. G., which has a tensile strength of 82,000 pounds per square inch. It was necessary to string all these wires at equal ten sion to svoid crossing in windy weather. To obtain this equal tension each wire is fastened to an iron bolt about 20 inches long. This bolt is provided with a strain insulator at one end, a tightening nut at the other. Because phono-electric wire does not stretch to appreciable extent this enables the spans to be drawn to the desired tension. The towers vary in height, one being 182 feet high and standing in a clearing, and the other 82 feet high, standing on a bluff."

The independent telephone movement in Greater New York, represented by the Knickerbocker Telephone & Telegraph Company, is making rapid progress, although its wires are not yet in use. The new company has some 5,700 subscribers, and new names are being added at the rate of forty a day. One hundred and fifty working wires have been laid in the subway from the down town district to 23d street, 400 wires from 23d street to 135th street, and twenty wires from 135th street to the city line. The pole line work has just been completed from Long Island City through Jamaica and Flushing to Far Rockaway.

Some of the business men of Nacogdoches, Texas, have organized a telephone company for the purpose of building a line from that city to Beaumont on the Texas & New Orleans Railroad extension, and from Nacogdoches to Houston on the Houston East & West Texas Railroad. The right of way has been secured and the company will shortly begin stringing wires on the Beaumont line. A sufficient force of men will be employed on construction to reach Beaumont by the middle of July. The line to Houston will be in operation a month later.

Mayor Hayes of Baltimore, Md., has instructed Chief Engineer Phelps, of the Municipal Subway Commission, to have a municipal telephone exchange installed in the city hall of that city as soon as possible. The Maryland Telephone Company agrees to establish the exchange and maintain it for one year on trial. The intention is to dispense with as many Chesapeake and Potomac telephones as possible.

The Southern New England Telephone directors have voted to increase the capital stock of the corporation from \$2,500,000 to \$2,750,000. The proceeds of this amount are to be used to pay off the floating debt incurred for enlargement of the company's plant in various parts of Connecticut.

# TELEPHONE INCORPORATIONS.

The Shawnee Telephone Company, Stone Bluffs, Ind. Capital stock. \$3,000,

The Kinloch Long Distance Telephone Company, St. Louis, Mo.—to construct and operate telephone lines. Capital stock, \$300,000. Incorporators: A. Busch. W D. Orthwein, P. Stock, W. F. Nolker, A. Gehner, S. M. Kennard, all of St. Louis.

The Petroleum Telephone Company, Charleston, W. Va, Capital stock, \$1,000,000. Incorporators: J. H. High, C. G. High, G. O. Chilton, J. F. Noyes, F. L. McGee, all of Charleston.

The Clark Automatic Telephone Switchboard Company, Providence, R. 1—to manufacture automatic switchboards. Capital stock, \$1,000,000. Incorporators: E. M. Prindle, J. W. Phillips, F. W. Reed, S. W. Tabor, F. A. Seib, all of Providence, R. I.

The Plainfield Telephone Company, Jersey City, N. J.-to operate telephone lines Capital stock, \$15,000. Incorporators: A. Dingler, R. J. Emory, both of Jersey City; H. F. Atkinson, of Red Bank.

The Greenwood & Canisteo Telephone Company of Steuben County, N. Y.—to connect by wire Greenwood and Canisteo, and surrounding territory. Capital stock, \$8,000. Incorporators: A. P. Woodward, N. E. Coston, J. M. Atkins, J. 8. Tobias, Greenwood; Frank Failing, Rexville,

# ELECTRICAL SECURITIES.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 161@16gc.; Lake, 161@16g ..; casting, 161@161c.

The Sonora Copper Company of New York, capital \$5,000,000, has been incorporated in Delaware.

The General Carriage Company of New York City took title recently to the Sixth Avenue car stables.

The Altha Automobile & Power Company of New York, capital ₹500,000, has

been incorporated in Delaware. The Gold Car Heating Company has secured the contract for electric heaters for the Boston Elevated Railway.

It is stated that the Brooklyn (N. Y.) Elevated Bailroad system will be oper-

ated entirely by electricity by July 15. The Yates Electric Light Car Company, capital \$300,000, has been incorporated in Albany to operate in Yates County, N. Y.

The Chicago Telephone Company has declared the regular quarterly dividend of 3 per cent., payable July 2. Books close June 26.

The United Traction & Electric Company of New Jersey has declared a dividend of 1 per cent., payable July 2. Books closed June 19 and reopen July 3

A dividen 1 of 5) cents per share has been declared by the directors of the R:ading (Pa.) Traction Company, payable July 1, to stock holders of record June 12.

The Ois Elsystor Company has declared the regular quarterly dividend of laper cent. on its preferred stock, payable July 14. Books close July 3 and open

The Hartford Street Railway Company will issue \$2,100,000, out of an authorized \$3,000,000 bands bearing 4 per cent. interest, and will retire \$1,800,000 5 per cent. debentures.

The Westinghouse Electric & Manufacturing Company has declared a quarterly dividend of 12 per cent. on its preferred stock, payable July 2. Books close June 21 and reopen July 3.

The North Chicago Street Railway Company, an important part of the Union Traction Company, will probably change its motive power from cable to electricity if it can get the franchise.

Coal exports from the United States during the ten months ended with April were nearly 5.) per cent. in excess of those for the like period last year, and ab. 80 per cent. ahead of 1898.

The Biston Electric Light Company will pay a regular quarterly dividend of \$2 persoare July 14, to stocaholders of record June 3), 1930. Transfer books will be closed from June 30 to July 16.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 14 a,15½; New York Electric Vehicle Transportation, 7¼(a,7¼; New England Transportation, 3(a,3¾; Gramophone, 35(a,40.

The directors of the United S. ates Machinery Company have declared the regular quarterly dividends of 1½ per cent. on the preferred and of 2 per cent. on the common stock, payable July 14. Books close June 20 and reopen July 2.

The Electrical Venicle Company of New York will pay new preferred stock share for share and a bonus in common for the stock of the Columbia Automobile Company, the Columbia Electric Venicle & Manufacturing Company and the New Haven Carriage Company.

The Baltimore County Water and Electric Company has filed a mortgage for \$1,000,000 to secure an issue of 5 per cent 4) year gold bonds. This company was recently organ zed by the consolidation of the Chesapeake Electric and Water Company with the Catonsville Water Company.

The General Electric Automobile Company of Philadelphia will sell out to a successor company, the capital of which is \$3,003,000. The new company will pay the old debts and raise working capital. It will issue stock at 80 per cent. to present holders, and creditors have agreed to take 5,000 shares at 83.

The Brooklyn Rapid Transit Company has opened two new lines to Manhattan Beach at 15 and 2) sents fare, respectively. One is from the Brooklyn bridge over the Kongs County Elevated and Brigation Board rationals. The other is by ferry from Wattehall street over the South Brooklyn Terminal Company and the Cul-

The Consolidated Car Heating Company has declared the regular semi-annual dividend of 1½ per cent. and an extra dividend of 3½ per cent., payable August 1 to stockholders of record July 16. Over 8 per cent. was earned. The board of directors re-elected includes Anthony N. Brady, Chas. J. Peabody and Geo. Westing-

Since June 1 the gross income from traffic of the Chicago Union Traction system has decreased at the rate of about \$1,000 per day, compared with last year. While perhaps the batter pirtion of this decrease must be attributed to the Northwestern Elevated competition, it is still true that weather conditions since the beginning of the month have been very unfavorable to surface traffic.

According to an exchange Chicago is to have an electric light war. It is to be a coercive campaign to force a sale of the Chicago Edison Company. The purpose is to concentrate in the Whitney E.kins Brady-B.lliugs cotorie the electric and gas lighting business of Chicago, with the intention ultimately to control surface traction and electric power distribution throughout the city whenever that can be effected.

A dispatch from Houghton, Mich., states that the two shafts of the Calumet & Hecla mine, which were closed during the recent fire, have been examined by Mine Inspector Hall and pronounced safe. Work will be resumed immediately in these parts of the mine. The rest of the shafts will be inspected as soon as possible. It is probable that No 2 shaft, where the fire originated, was so badly burned that

The Boston "News Bureau" says: So much uncertainty has been, occasioned as to what disposition the Western Union Telegraph Company was to make of its recently authorized \$21,000,000 bonds, the idea prevailing in some quarters that it was to enable active competition in the telephone field, that we give herewith the company's official statement regarding this matter: "From the proceeds of the sale of the \$10,000,000 of the bonds the undermentioned bonds have been retired and paid off; 6 per cent, bonds due March 1, 1900, \$761,000; 7 per cent, bonds due May 1, 1900, \$4 921,000; to provide for new orderty and new lines constructed in excess of surplus earnings since 1897, 1898–1899 \$2,076,50; balance to be used for the acquirement of new property and the construction of new lines after June 31, 1899, \$2,212,499; total, \$10,000,000. The remaining \$10,000,000 of the authorized about \$1,000,000 thereof are reserved for the purpose of retiring the \$1,163,000 of 7 per cent, real estate bonds (less the sinking fund), due May 1, 1912, which are a lien upon the Western Union Building, No. 195 Broadway, New York, and the remaining \$9,000,000 thereof are reserved and shall be used solely for improvements, betterments and extensions of the property and the development and enlargement of the business of the Felegraph Company, or for such other corporate purposes as may be authorized by law."

Vol. XVIII.

#### EDITORIAL NOTES.

Motive Power for the Cross-Town Lines of New York City. Although it has not been definitely stated that the compressed air system of street-car propulsion that is employed by the Metro-

politan Street Railway Company of New York City on its Twenty-eighth and Twenty-ninth street cross-town lines, is to say the least a disappointment, still one would be led so to believe from the fact that at a recent meeting of the stockholders of the above company it was announced that a storage battery system would shortly be given a trial on the Thirty-fourth street cross-town line. And in our opinion this will be a case of "out of the frying-pan into the fire."

That the compressed-air system now in use has not proven entirely satisfactory may readily be inferred from the number of accidents that have occurred, and which are directly attributed to this form of motive power. Not long ago a tank exploded injuring several employes, while every now and then the mechanism of a car becomes deranged, necessitating a more or less protracted delay. Add to these mishaps the fact that compressed air cars puff and snort like a locomotive, and leave in their wake a trail of grease and filth, and it is not a very difficult matter to see why some other system is about to be tried on Thirty-fourth street.

But the question arises, will the storage battery system prove any more satisfactory than the compressed air? To the general public it certainly will, owing to the absence of the above-mentioned objections. other hand the company will undoubtedly soon find that the operating expenses on such a line are exceedingly high, to say nothing of other minor defects. The directors of the Chicago Electric Traction Company have just awakened to this fact, and have decided to change over their system from the battery to the overhead trolley. The Chicago road, however, comprises some twenty odd miles of track, whereas the proposed line in this city will be at the most but a couple of miles in length.

That the problem of installing a suitable system on such a short length of track in a city like New York is a knotty one must be acknowledged, and the reason given by President Vreeland for trying the storage battery system

on Thirty-fourth street was to obviate the cost of building a conduit for an underground trolley, which, he is reported as saying, on a cross-town line was so expensive that it would hardly pay, except on a line where the traffic was very heavy. Referring to a rumor that the company contemplated abandoning the air power system he said:

"It would have been quite as reasonable to have said we were going to abandon electricity when we began experiments with air power as to say now we are to abandon air power because we undertake to experiment with the storage battery. So far from abandoning the use of air power, we are equipping the Twenty-eighth and Twenty-ninth street roads with new heavy rails and are awalting an entire new equipment of cars with a different type of motor from those now in use, in which all the defects experimentally developed in the first lot are eliminated"

In spite of the above statement it is safe to assert that had the compressed air system come up to expectations there would have been no necessity for giving the storage battery system a trial. The cost of building an underground trolley system is undoubtedly great, but it is questionable whether after expending a large sum of money experimenting with compressed air and storage batteries, the company will not in the end be obliged in self-defence to have recourse to the conduit system.

A Decision
Relating to
Electric Furnaces.

Frequently a suit arises over a patent that threatens to revolutionize the methods of an entire industry. The famous Ber-

liner case was such a one, while still more recently a decision was handed down in Philadelphia which may seriously affect, if not entirely cripple, some of the large manufacturers of products requiring electric furnaces. The suit in question is that of the Electric Smelting and Aluminum Company of Cleveland, Ohio, versus the Carborundum Company of Niagara Falls, N. Y., for infringement of patent rights. The patent involved is one issued to E. H. and A. H. Cowles on June 9, 1885, for an improvement in processes for smelting ores by the electric current.

The Cowles patent covers the mixing of carbon with the substance to be reduced, which causes a far greater resistance to the passage of an electric current, a consequent rise in tem-

perature and diffusion of heat throughout the mass.

While experimenting with such a furnace many years ago-so the story runs-the Cowles brothers attempted to fuse common sand into rock crystals. A core of carbon fragments was imbedded in the sand, and the current turned on. After an interval the furnace was opened. and a considerable quantity of fused sand was removed. In the center of the mass next to what had been the core of carbon, was found a small quantity of crystals nearly as hard as diamonds. These were thought to be crystals of the element silicon, of which sand is an oxide. Little more attention was given the matter by the Cowles brothers, who turned their attention to the manufacture of aluminum, until Mr. E. G. Acheson, who perfected the process for the manufacture of carborundum, exhibited his product in the various stages of manufacture at the World's Fair in Chicago in 1893. Mr. Alfred Cowles then recognized, or thought he recognized, the crude product as identical with the crystals which he had made. The result was that a suit for infringement was begun. The case was tried before Circuit Judge Buffington in the Western District of Pennsylvania, and was decided adversely to the complainant. In summing up his decision the Judge said:

"Indeed, the process, preparation of ingredients and means employed in the two processes now under consideration are diverse and the desired objects unlike. A like thermo electric agent is employed in both, but with it the substantial likeness ends. Cowles' object was reduction, while Acheson's was composition. One reduced a substance already in existence. the other by composition produced a new pro-With Acheson the new product consumed the carbon constituent of the charge; with Cowles an excess of carbon constituents remained at the close of the process. In Cowles', the charge for functional purposes, occupied the central space between the electrodes. In Acheson's, for functional purposes it was removed from such central space and from electrode contact. In Cowles' an excess of carbon was required in the charge mixture as a current conductor; in Acheson's no such excess was required or used, but the carbon for that purpose was isolated in the central core. Their methods are so radically unlike and are carried out on such diverse lines that we are firmly convinced that the charge of infringement has not been sustained."

The case was appealed and reargued before Judges Gray, Dallas and Bradley, sitting in Philadelphia as the Circuit Court of Appeals. Before a decision was rendered, Judge Bradley retired from the bench, and at the request of the Court the case was again reargued. Judge Bradford, who succeeded Judge Bradley, writes the decision recently handed down. In his decision he lays stress on "the disposition of the resistance material with respect to the material to be treated." It points out that in the Cowles patent claims it is stated that the ore "is usually mixed with the body of granular resistance material," which implies the two need not always be mixed. It points out that, although the description of the process which accompanied the application for the patent mentions mixing the ore and carbon, as does one of the four specific claims made for the patent. The language of the other claims, in the estimation of the court, require merely contact in contradistinction to mixture between the resistance material and the material to be treated. The decision is, therefore, that claims 1, 2, and 4 of the Cowles patent have been infringed."

The case will in all probability again be appealed. If the present decision is sustained it will prove a very serious matter, not only to the Carborundum Company but to other concerns engaged in the manufacture of products requiring the use of electric furnaces. There would seem to be a chance, however, of the patent expiring before the litigation comes to an end.

#### \* \* \*

Bierce Edison and Tesla. Mr. Ambrose Bierce is one of the distinguished newspaper men of the metropolis, and his contributions to the daily journals generally secure a position on the editorial page. We have

admired his artistic way of attacking shams and his pungent paragraphs about brainless labor leaders, but we were astounded to see him enter the electrical field and select two of our noted scientists for subjects to lash with his pen. Under the caption "Edison and Tesia Have Too Many Freak Ideas" Mr. Bierce writes as follows to the "New York Morning Journal":

"In creating the new science of electrology the Author of All Things seems, for some reason to us unknown, to have decreed that only fools should attain to proficiency in it. Of Thomas Edison, the Blind Tom of the science, it may be said that he knows more about electricity and less about everything else than any man living except Nikola Tesla. Neither of these men ever opens his head to tell us what he knows without diverting attention from the performance to the gigantic sum of what he does not know. Both appear to suffer from an incontinence of words aggravated by an impediment in sense. They always think 'the time has come, 'as the walrus said, 'to speak of many things,' and of many things accordingly they do everlastingly and pitilessly speak; but mostly of what they are about to accomplish in the way of turning the world inside out and the universe outside in.

"A favorite topic with these peaceful civilians is war, which they are always going to 'revolutionize' or 'abolish.' Many of this paper's readers will recall Mr. Edison's leglong utterances on this topic just before the Yanko-Spanko unpleasantness—how his electrified water, fired from a garden hose, was to paralyze entire legions, his electrified chains, flung out of two guns each, were to mow them down, his torpedoes, traveling on endless trolley lines under water, were to make smithereens of battle craft, and the rest of it: all showing with clarity his fitness for the great leather medal of the Society of Friends for distinguished services as one of the horrors of peace.

"Mr. Edison's conception of what war is like would, if it could be photographed, resemble a combat between a set of ten-pins and a row of beer bottles.

"And now comes (for the one hundred and forty-ninth time) Mr. Nikola Tesla with the old battle-fire blazing in his eyes—'of which he hath two.' He is going to revolutionize warfare off the face of the earth, the ocean included. The ocean, indeed, appears to have the honor of selection as the best field for his military activity against the demon War. Briefly, the good man has invented an automatic battleship, which needs no crew and can be navigated from port. In an emergency this wonder of the deep can think a bit for itself,

and act on its own best judgment; so if the patriot at the push-button should fall by disease or be elected to Congress it will not greatly matter; the floating fortress will pursue the evil tenor of her way, managing her guns and torpedoes all by her lone self.

"It is a great invention, but Mr. Tesla has somewhat impaired its value to us by coldly intimating his intention to impart it to all the nations of the world, so that wars shall henceforth be carried on without sailors and soldiers. This, he astutely infers, will make it bloodless and therefore uninteresting, and eventually it will fall into the sear and yellow leaf and be waged no more. That will be a great relief, certainly, particularly to those-if any such there be-who have no old ships to sell to the Navy Department. Still, war is not without its advantages. While it is 'on,' for example, we hear nothing from freak electricians and their devices for revolutionizing it. As a whole pond full of yellow frogs are silenced by the splash of a stone, so the roar of arms fool inventors of impossible weapons who hide their diminished heads and are heard to cease.'

We venture to say that Mr. Edison and Mr. Tesla laughed loud and long when they read the above, because we all know that the distinguished gentlemen, to quote the words of a famous writer, "care not for a noisy crowd bellowing and shouting praise or blame."

#### UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

THE electricians of the State of Iowa have recently perfected a permanent organization known as the "Iowa Electrical Association," which is for the benefits which may accrue to them as members. W. I. Green of Cedar Rapids is president and G. F. Keffer secretary.

Last week the delegates to the Second Annual Convention of the United States Electrical Contractors' Association enjoyed an automobile parade in this city. Twenty-five vehicles started from Broadway and 25th street. After the parade to Riverside Drive and 129th street, the delegates went on the steamer Laura M. Starin for a trip about the harbor.

The Board of Public Works at Cleveland, O., has announced the retirement of the mule as motive power on the canals of that State. The boats on all Ohio canals will hereafter be propelled by electricity. The canals between Dayton and Toledo are to be equipped within the next four years.

THE Kansas City "Times" states that an employe in a packing house in that city has invented a device for extracting the feathers from chickens that is a considerable improvement over the old way of picking them by hand. There is a receptacle in which the fowl is placed after being killed and into this are turned several cross currents of air from electrical fans revolving at the rate of 5,000 revolutions per minute. In the twinkling of an eye the bird is stripped of its feathers, even to the tiniest particles of down, and the machine is ready for another.

According to a Chicago paper steam railroad officials are becoming alarmed by the increasing prominence of electric lines and fear their competition in long-distance freight and

passenger traffic. Only a short time ago an Illinois corporation was formed to build a network of electric lines in the northern part of the State. This will be equipped for freight business. One indication of the steam railroads' suspicion of their rising competitors is a late action of the Michigan Central road in canceling its traffic agreement with the St. Catherine and Toronto Railroad because the latter has recently changed from steam to electric power. The electric lines in and about Chicago have cut into the suburban business of the steam railroads. The St. Paul, recognizing this, is now seeking an ordinance which will permit the substitution of electricity for steam. So important has this suburban and interurban business become that Cicero J. Lindley of the Illinois Railroad and Warehouse Commission, in his address before the National Convention of Railroad Commissioners in Milwaukee, suggested that electric lines be placed under the control of a commission as steam railroads are now.

THE New Jersey & Hudson River Railway & Ferry Company, formerly known as the Bergen County Traction Company, which operates between the Fort Lee Ferry, Englewood and Hackensack, N. J., has just completed its line into the latter city. On Thursday last the first car containing officials of the company and their friends passed over the new stretch of track. It was a gala occasion, the carwhich by the way was also new-being decorated with flags. A portion of the construction work comprises a handsome and substantial iron truss bridge over the Hackensack River. After examining the bridge and trestle, and being "shot at" by a photographer, the officials and their friends were carried back to a little grove, where under the friendly shade afforded by the trees a most appetizing collation was served.

THE American Association for the Advancement of Science began its forty-ninth annual session on Monday last in Havemeyer Hall of Columbia University. The programme included an address by Prof. G. K. Gilbert, the retiring president, who introduced the newlyelected president, Prof. R. S. Woodward of Columbia University. The council of the Association held an executive meeting at the Hotel Majestic on the 23d inst. The principal business was the election of about two hundred and fifty new members, among whom were Cornelius N. Bliss, Senator T. C. Platt, Walter S. Logan, James S. Benedict, Edward Cooper, John S. Eno, Dr. R. H. Sayre, Prof. E. B. Wilson, of Columbia University; President J. G. Schurman, of Cornell; Abram S. Hewitt, Mrs. E. L. Godkin and Mrs. Henry Draper.

THE University of Heidelberg, after an investigation into the effect upon the eyesight of the electric incandescent and the gas incandescent light, has decided that neither the electric light nor the incandescent lightif properly placed in regard to the eye-has any bad effect upon the eyes. In the case of the electric incandescent lamp, such injurious effect is utterly impossible under ordinary conditions. It was found that incandescent gas more nearly approaches the character of daylight than does the electric light, and on the principle that artificial light which has a spectrum most nearly resembling that of sunlight is the best for the eyes, incandescent gas has a sure future before it for interior lighting.

The heat given out by the newer forms of incandescent gas is estimated at only one-half that of the electric light. On the other hand, there is no vitiation of the atmosphere where the electric light is used. Finally the committee which had the subject in hand came to the conclusion that for the lighting of rooms, especially concert halls and lecture rooms, where many people remain for long periods at a time, the electric light is without doubt to be preferred to all others from a hygienic point of view.

ELECTRIC dog carts are being built in England which carry four passengers and run fifty miles with one charge. The cart has three speeds-three, six and twelve miles an hour.

A HIGH power electric motor car was tested over the New Canaan (Conn.) branch of the Consolidated Railroad on June 21, and the officials of the road are confident that it can maintain its alleged speed of sixty-five miles an hour. There are two motors to each truck. The car is the first of a number which are to be used between Providence and Fall River. The distance is seventeen miles and it is proposed to make the trip in fifteen minutes.

THE recent decision of the Supreme Court permitting the operation of frieght cars on surface railroads is to be taken advantage of by the Brooklyn Rapid Transit Company whose counsel, John D. Walls, is reported as saying: "We realize that with a freight department or delivery attached to our road we can give the people a quicker and much cheaper service than they now have. It will also remove from the streets many of the present obnoxious trucks. I believe we can deliver freight to all parts of Brooklyn for one-quarter of what it now costs; oh, yes, I really believe it could be done for even less than that. We now operate express cars and they interfere with no person and the public gets the benefit of the improved service."

THE electrical department of the Reading (Pa.) Company is conducting a series of experiments at the locomotive plant at Reading with a view of ascertaining just what power will be required to run the machinery connected with the shops now in course of construction. It is understood that all the machinery as well as the traveling cranes, fans, etc., will be run by electricity. The illuminating of the yards and stations about Reading and its suburbs will be done from the main power house of the company.

In order that visitors in Detroit, Mich., may see the best part of the city cheaply and comfortably, Vice-President Hutchins of the Citizens' Street Railway Company is about to inaugurate a novel experiment in street railway use in the form of a sort of a tallyho trolley car, which will be put in service July 1. Every morning the car will start from the Russell House at 9 o'clock out Woodward avenue to the city limits, back again through the city, out Jefferson avenue to the Waterworks park and return to the Russell House. The round trip will consume two hours, and will be made leisurely. The same trip will be made five times during the day. The fare is to be 25 cents.

A "Tramways and Light Railways Exhibition" is now being held under the direction of the "Tramway and Railway World" at the

Royal Agricultural Hall, London, England, to terminate July 4. The exhibition has been arranged with the object of enabling municipal and other local authorities, tramway directors and managers, as well as the general public to examine the latest apparatus designed for the equipment of mechanical tramways and light railways, both surface and underground. The following prizes are offered: (1) A prize of £25 for the best invention for securing a dry seat on the tops of tramcars and omnibuses in all conditions of weather; (2) £25 for the most practical and efficient life-saving guard or fender for tramcars.

Mr. Laliberte, chairman of the Quebec Harbor Commissioners, has submitted to that body a project of great importance, looking to the harnessing of the tides in the harbor of Quebec, and the utilizing of the enormous power contained in them. There are immense electrical possibilities in this tidal power, hitherto running to waste, which could be used to operate grain elevators, saw, pulp, rolling mills, factories and other industrial enterprises. No other city in Canada, except St. John, N. B., has such a rise and fall of tide as Quebec. It ranges from 16 to 18 feet, and possesses a power beside which that of Niagara would be dwarfed; if it could be utilized it would prove of immense advantage. It is proposed to invite eminent engineers to study the question and submit plans for its solution.

THE Electrotechnische Verein of Vienna. Austria, has decided to organize a large electrical exhibition, to be held in Vienna from May to October, 1903, to celebrate its twentieth year of existence.

It is announced that arrangements are being made at Ilfracombe for experimenting with wireless telegraphy between that town and the Mumbles, across the Bristol Channel, a distance of about 21 miles. The pole to be used is about 120 feet in height.

A LARGE manufacturing establishment will soon probably be erected in Ottawa for the manufacture of electric plants to treat garbage and sawdust so as to get all the commercial products from them. Prof. V. L. Emerson, whose experimental plant for the treatment of sawdust erected at Ottawa some time ago, was such a success, is now arranging for the manufacture of the machines in the United States and in Canada on a large scale. A feature of the work done by Mr. Emerson's machines is to take sawdust and garbage, dry it in a machine, then have it treated so as to extract the heavy oils and alcohol, etc., and continue the process until the purest results are obtained. Mr. Emerson has constructed at Ottawa a large working model of his plant capable of handling several tons a day Already a number of tests have been made at Ottawa. Scientists and capitalists have viewed the working of the machine with much satisfaction. Ordinary city garbage, it is stated, can be treated so as to secure products worth \$8 and \$9 per ton of the garbage.

THERE are 5,645 telephones established in Tokio, and there are 5,641 applications waiting to be satisfied. Of the latter 1,700 will be supplied during the present year; 2,200 may expect to get their telephones by the end of 1901, and the remainder will have to wait until 1902.

#### INDEPENDENT TELEPHONE INVEST-MENT.\*

BY HUGH DOUGHERTY.

Conclusions should not be drawn from an inspection of figures indicating profit for the present month or year, produced by subtracting operating expense from gross receipts alone.

In order to answer the very natural inquiry by the investor, and one sure to be propounded, viz, "What assurance of permanent profit at a rate not less than that indicated by your figures can you offer?"

Several things in the way of conditions, along with the figures, must be considered.

First—The necessity of the telephone service to the business world.

Second — The rate charged for exchange and toll line service.

Third—The character of construction and equipment.

Fourth—The profit and benefit to the user of the telephone, securing continued and increasing patronage.

It would seem that the knowledge that the members of this Association have of the increase of business for five years past of the independent telephone throughout the United States, would be sufficient answer to the first proposition, viz: that it is a necessity to the business world and cannot now be dispensed with any more than the telegraph or mail service.

I think all fair minded men will admit that the telephone completes the triune of business necessities, viz; the mail, the telegraph, and the telephone; the three great means of transmission of thought; the three giants that have annihilated distance.

There was a time when the mail service was not appreciated as a necessity because of a lack of knowledge of its usefulness; then messages were sent by carriers. Although we now have the telegraph and telephone through which we commit our thoughts to the care and confidence of others, yet by means of the mail we may write our letter in secret, seal it up and post it, assured that no one may know its contents, except the one who receives it.

I consider this of vital importance to the future of the race, for if love making were to cease by means of the mail, many a fellow, being too poor to pay the railroad fare to visit his best girl, would be shut out, as he would not dare to trust his love secrets to the average telegraph or telephone operator. This important feature of the mail service together with the low rate of postage insures its continuation.

The telegraph is a necessity also for quick transmission of such business when a record is necessary which may be used in the courts and for the regulation and control of the movement of railroad trains.

This insures the future use of the telegraph: while the telephone, the last but not least in the great triple alliance of contributors to the benefit, comfort and pleasure of the civilized world, takes the place, to a great extent, of both the other two, and at the same time affording many advantages possessed by neither the mail nor telegraph. This is especially true in the usefulness it has developed in aiding the transaction of business over the world's counter, where the volume of business to be

handled is great and prompt dispatch is important.

This should satisfy investors of the necessity and of the permanency of the telephone, and while there may be many inventions, such as wireless telephony, wireless telegraphy, the telegraphone, speaking tubes or some scheme of electrical signals, none of which can interfere with or disturb the usefulness of the telephone.

But on the contrary, I think that fifty years hence, as it has been in the past with the telegraph and mail service, the sphere of the telephone will be widened to an extent not dreamed of to-day, and all those who invest their money will be perfectly safe so far as permanency, stability and satisfactory profits are concerned.

In reference to the second proposition, the rate to be charged for telephone service should be such as the public can afford to pay in the locality where the investment is made.

This is only second in importance to the necessity of the independent telephone when considered by the investor. No arbitrary rate can be named for all conditions.

In this respect it is different from many other lines of business. The small country town of 1,000 or 2,000 inhabitants has many subscribers whose net profit in their business for each year is but little above the expense of living, and who are compelled to economize on all expenditures; they must therefore have a low rate.

Besides, the telephone is not as great a necessity to the smaller business as it is to the business man in the larger town or city; and yet telephone service within, to and from the village or small town is necessary to the system in order to make the investment a good one from the standpoint covering the general system of the country.

In this particular our competitor, the Bell Corporation, overlooked an important fact until they were educated to it by the success of the independent people. The exchanges in small towns must and will be managed by local people who can give them sufficient attention, after having time enough to manage other lines of business; therefore, the expense is much less in proportion than in the larger cities, since it is universally agreed by all those who have had experience in the construction and operation of telephone exchanges, that the expense per 'phone is much greater in the larger exchanges than the smaller ones.

This same thing holds good as to the management and operating expenses: so that the wise investor in telephone properties will see to it that the villages and small towns are connected up and are made a part of the system he invests in, which will add permanency and usefulness to the business, and that the rates are such that the ability of the people to pay will warrant their continued patronage.

Third—The greatest mistakes in the independent telephone field up to this time have been in the character of the construction and equipment. At the beginning of the movement so many of the appliances of electricity in the telephonic art were covered by patents that the independent manufacturers found themselves handicapped and were compelled to use devices that were crude in their nature and slow in operation. All of the important patents have expired and it is now possible to have equipment as good and even vastly superior to that in use by the Bell Company and its licensees in most of their exchanges.

The manufacturers of the independent telephone apparatus have been fully alive to the fact that to succeed the independent companies must equal and excel the service given by the old companies.

They have been alert and watchful and have put within reach of the investor the highest type of apparatus known to the telephone world at moderate cost. First cost should not be considered however by the investor even in exchanges of the smallest capacity so much as high efficiency and economical operation.

It is equally important that plans for telephone plants, either for exchanges or toll line purpose, should be made at least double the maximum capacity thought at the time to be necessary.

It has been the universal experience that the business has over-reached the rosiest estimates of the most optimistic director, and I doubt whether there is a single independent company in the country three years old that has not been compelled to enlarge its office equipment, or rebuild its leads at least once. The investor should see to it that the promoters build large and build well at the start if he wishes to keep the actual cost of his plant at the minimum figure and be attractive to capital.

Restating the fourth proposition as a question, "Is the profit and benefit to the user of the telephone great enough to insure his continued patronage?" the answer comes from the three thousand exchanges representing their one million subscribers and millions of toll line patrons who are loyal to the independent system.

One of the most important things for the person, firm or corporation who has wares for sale is to know that the purchaser will be benefited when he exchanges his money for the goods. When this is true, the article itself is the salesman and then the only question to consider is the production of the goods at a profit, and how to meet the demand for them.

It is admitted by all to whom I have talked, and who have had experience, that the demand for the independent telephone is greater than the capacity of the manufactories for its production, and the eagerness with which the new subscriber insists upon his 'phone being placed demonstrates the absolute necessity of telephone service to the business man and citizen, and discloses the cause of the marvelous growth of the independent system to such magnitude as to astound managers and investors at the unparalleled patronage reached and realized in so short a time.

All this could not have occurred unless the use of the telephone were a source of profit and benefit to the subscriber, so by the light of recent experience the investor can be at ease as to the future demand for the 'phone.

Investors who have never studied the general situation of the telephone business will be interested in the statements of the Central Union Telephone Company, which is the basis upon which they ask moneyed men to invest in their 5 per cent, bonds.

That they had increased in the number of exchanges from the year '95 to the year '95 from 133 to 193, in toll stations from 955 to 2,090, in miles of wire in toll lines from 15,088 to 43,935, in miles of poles in toll lines from 4,840 to 11,168, the number of subscribers from 32,007 to 59,810, and the net earnings from 6305,767.59 to \$527,220.81. While they have increased in the number of subscribers for the four years

<sup>\*</sup>Paper read at the Fourth Annual Convention of the Independent Telephone Association of the United States, held at Cleveland, O., June 12-14, 1980.

past about 90 per cent, their increase in net earnings is only 72 per cent.

In addition to this showing they urge as an inducement to the investors in their bonds, "that these statistics cover several periods of financial depression," and that they are particularly interesting, demonstrating as they do, how absolutely essential the telephone has become to the development of business and social interests.

In nearly two decades there has been an unbroken record of yearly increase in the net instrument output, proving conclusively, it would appear, that under the necessity of most rigorous retrenchment in other channels during a portion of these periods the telephone has been retained by the general public as an economizer of time, labor and money.

I am not here to dispute any statements made by the Central Union Telephone Company, but it is very interesting to the independent telephone people to notice this fact. that in the statistics shown by the Bell people's output of instruments, that their growth up to '94 when the independent system commenced to educate them, the Bell Company had been exceedingly slow, that fourteen years prior to '94 they had put out less than 600,000 'phones under rental to licensees, while during the five years following that they increased to nearly double that amount. This was because the independent people entered the field and forced them, as competitors, to operate in the smaller towns so that they might be able to hold their customers in the larger cities.

Six years ago there was not an independent telephone exchange in the States of Ohio, Indiana nor Illinois covering the territory where the Central Union Telephone Company now operates.

Now there are in Ohio 217 companies operating 321 exchanges with an aggregate of 47,000 subscribers and 8,500 miles of toll line, and there are in Indiana 160 exchanges with an aggregate of 25,000 subscribers and 7,000 miles of toll line, and in Illinois there are now 200 companies operating 252 exchanges with an aggregate of 30,000 subscribers and 6,000 miles of toll line.

Therefore the Independent people now have in Central Union territory 733 exchanges, 102,-000 subscribers and 21,500 miles of wire in toll lines, which excels the Central Union largely, yet they are only six years old, while the Central Union has been in business twenty years.

What is true of Obio, Indiana and Illinois is also true of nearly every other State in the Union. The independent telephone movement is of the people. It had its birth in the protest against the monopoly that claim the exclusive right to the entire telephone field of the United States and refused to occupy more than one-thirtieth of it.

The public is not unmindful of the fact that it owes everything to the men who have risked their capital and time in these telephone enterprises, and is sure to sustain them through the generous patronage because of their knowledge that the destruction of the independent telephone is their direct loss.

In fact one of the greatest securities that the telephone investments offer is the hold that the independent telephone movement has upon the people. This is not a mere sentiment, but is the outgrowth of what was a stern necessity.

The telephone business was too large to be covered by any one corporation. No one concern could own all the railroads in the community, nor all the flour mills and elevators,

nor all the real estate. Neither could one concern own all the telephones and toll lines necessary to supply the wants of all the people.

The failure of the Bell Company to do this was doubtless owing as much to their inability to do it as to their indisposition to do it. The independent companies have supplied this want. They have taken actual and substantial possession of the field. They are now much nearer the people than the other company ever could hope to be. They will stay nearer the people, because they are of the people. The man who invests his money in independent telephone property, has it very largely under his own eye.

An additional reason the independent telephone is more attractive to the investor is that the dividends paid by the American Bell Telephone Company for the year '98, amounting to \$3,882,945, was largely contributed to them by their licensees; the largest among these is the Central Union Company, covering Ohio, Indiana, Illinois, and who must contribute this amount before they are put on an equality with the independent system in their expenditures

The companies who are licensees of the Bell Telephone Company must take this extra amount off of their patrons above what the independent people charge or else their stockholders must foot the bill. This seems to me is an additional reason why the investor in the independent telephone shall feel secure as against their competitors.

No enterprise or property of any kind seems to me should be so attractive to capital and so safe an investment as the independent telephone securities.

This business has long since passed the experimental stage, and is now an acknowledged safe investment. Within the next five years, in my judgment, it will be the most highly favored local security in every community.

### AUTOMOBILES AS A SOURCE OF REVENUE FOR CENTRAL STATIONS.\*

BY ELMER A. SPERRY.

One year ago, in New York, predictions, optimistic in their general tone, were made as to the rapid and general adoption of electric road vehicles, and some disappointment has been felt by station managers that more substantial advancement toward heavy demands for current has not been forthcoming for this purpose. Managers will recall that during the year frequent inquiries have been made that have not resulted in desirable business.

It is my purpose to outline briefly some of the factors that have contributed to these unfavorable conditions, and to record some advances made. It has been discovered in many instances that the demand for current is not so favorably located on the load curve or on the network as was hoped; for instance, electric delivery wagons required charge at times of heavy load, and on the part of the network heavily taxed in lighting. Again, the factors controlling the seasons of the heavy demand for lighting during the year are found identical and in phase with those requiring heavy duty of commercial electric vehicles. The carriage of the shopper and the delivery vans are both more active at these seasons; furthermore, the same weather conditions producing heavy traction at the same time, increases the demand for light. In a word, the diversity factor that it

\* Paper read at the Twenty-third Convention of the National Electric Light Association, Chicago, Ill., May 22-24, 1900.

was hoped would be introduced with the automobile, has not been in evidence.

Many of these difficulties may be made to disappear entirely, and the diversity factor be developed that is practically ideal, by the simple device of duplicating the traction batteries. Where this has been done, it has been found that the charging can go forward at times and rates dictated by the station, and practically under its control. No hardships need be experienced by rigid conformance with this practice. Careless infringement of this principle may be remedied in a number of ways; the employment of two-rate meters has been suggested in this connection.

The station management has not in all instances been able to conceal disappointment at the unfavorable developments along some of the lines above pointed out and has allowed it to react back to inquiring parties. I regret to say that prospective customers have in cases been embarrassed by want of co-operation, aid and enthusiasm, justly expected from the management. Opportunities have thus been lost to encourage the industry, as the results that are now assured amply justify, as I shall endeavor to show.

Mechanical traction is coming rapidly to the front; animal power is being superseded on every hand, and, especially for commercial uses, a universal effort is being made to break away from the horse and place roadwork on a mechanical basis. As a source of power, the mechanical is found to be simpler, more reliable, and shrouded in far less mystery than the cellular-tissue-nerve combination. It should not be out of place, before this body, to recall some of the evident merits and advantages of the electric over other automobile systems. The perfect storage battery presents some remarkable features; it even rivals the electric motor itself in its fitness and special adaptability to the automobile problem. Its very large reserve power at instant command; its entire freedom from danger when fully charged; its almost constant pressure throughout its capacity-mark its superiority. This straight line of discharge of the battery is not matched by any other power-storage system of which we have knowledge. The recently developed capacity for quick charging, and the ease with which the charge may be obtained in almost any hamlet in the country, are among its advantages.

It has long been supposed that compressed air is an ideal form of stored power, but it is safe to say that electric storage distances compressed air in all the important features. Reliable batteries are now available and on the market that will yield for each hundred pounds 1.8 horse-power hours. Compressed air will yield to every hundred pounds (air and tank exclusive of reheater) three-tenths horsepower hour; or six times the power for electric that it is possible to obtain from air. This result will be a surprise to some engineers. The fact that with the electric system we have a rotary motor of ideal simplicity, with a capacity for overload coupled with an efficiency that is nothing short of wonderful, contributes inestimably to the success of electric-motordriven systems, and is in marked contrast to the multiplicity of compounded, reciprocating engines employed as motors by our compressed air friends.

The single feature of constantly increasing cost of supply of fuel-using vehicles has already driven the makers to the extremity of seriously considering alcohol, with its weak

power factor, as a possible substitute for the lighter petroleum products. The thoughtful engineer is constantly confronted with conditions indicating that in the realm of power coal is king, and only those traction systems that are organized to derive power from this source will keep to the front. This point, coupled with the electric system, is responsible for the stupendous development in present urban or street traffic; to show its superiority over all other powers, one needs only recall the total absence of either steam or gasoline street cars. Germane to this subject, the question is often asked, will autos replace street cars? Its great flexibility and independence of track certainly render the new claimant an ideal urban conveyance. Can the central-station man look forward to supplying so large a demand as would thus be created?

The automobile under street car conditions brings forward an interesting field of inquiry. The single fact that the stupendous cost of permanent way and its maintenance is at once eliminated makes the problem of more than ordinary importance. The interest and income on these two items would yield so large a sum as easily to off-set much extra expense of operation, and especially expense attending the development and smoothing out of the early working, and covering the expense of adjusting a system of this magnitude to new conditions. Such a system would, however, be subject to certain limitations, chief among which will be found decreased weight per passenger, difficulty of easily directing the excessively heavy structure, large increase in power per passenger carried, increased rolling friction factor, and-one of the most important-the limitation as to roadbed, soft tires being precluded by the excessive tonnage. Considering these factors separately and collectively, the point is at once reached, showing conclusively that with anything like wheel pressures equal to that now obtaining in street-railway service. nothing but steel pavement could be practically employed. To demonstrate this matter, tests were made as follows: Asphalt roadbed was taken as the standard roadbed of the future. A piece of very hard asphaltum, laid in the most approved manner, and in constant use for two years, was selected. This had been maintained at an average temperature of thirty-eight degrees for eighteen hours (no sun), the highest temperature during this time being forty-six degrees at time of test. A sixtytwo inch wheel with three and one-half inch steel tire was loaded to 5,000 pounds on scale. This wheel was taken over various parts of the hard asphaltum with the following results: Once over, average depression .029 inch; twice over, average depression .047 inch. These depths were taken by a micrometer, depth gauge easily reading to one-fifth of a thousandth of an inch, and some thirty readings were taken in each instance. It will be noticed that this depression is somewhat over one and one-half thirty seconds of an inch. The amount of this depression is surprising. considering the comparatively light load, broad tire, large wheel, extremely firm condition of the roadbed, and the temperature at which the asphaltum was tested, and seems to bear out the statement that the real limitations are probably more those of roadbed than of any other one factor.

Another factor destined greatly to increase the radius of action of electric vehicles, and the consequent demand for power, is roadway improvement. The present good-roads agitation is certainly in line of progress, and should be given all possible aid and encouragement. In this connection, I see no reason why we could not wisely follow the plan, based on historical precedent, of utilizing for this important work of permanent improvement our convict labor, the disposition of which in this country has always been a source of embarrassment to the authorities. This system certainly has much to recommend it, and the improvement of our roadways calls for a vast expenditure of labor and has much need of a uniform and systematic effort.

The fact remains, and has been emphasized within the past year, that progress in electric vehicles has not been as rapid as was expected, and causes have existed that were not before seen and were not generally understood. Some vital reason seems to have prevented the rapid development and general adoption that at one time seemed assured. Was it the element of cost? Two important conditions stand out prominently in connection with electric road vehicles, these are first cost and cost per mile of operation. It is not my purpose to discuss the first, as there are endless variables entering into the question, and it is doubtless true that the prices will gradually decrease. This part of the problem is always found to be selfcorrecting, and even to-day, with the electric, the cost per pound of vehicle complete is lower than other and far less available and pleasurable systems.

The cost of electric power for automobiles has deen demonstrated in Paris to be less than with any other power system, and surely this factor is not the one now preventing the wide adoption of electric vehicles. In a paper before the American Institute of Electrical Engineers, G. F. Sever and R. A. Fliess, of Columbia University, give results of extended trials with electric delivery service in New York City. It is shown that with present power and rolling friction factors there is effected a saving of nearly two and one-half cents per car mile over horse service; and with the capacity of many more miles per day than with horses. With a daily service of thirty-six miles, a saving of 356 hours per year of actual delivery service per vehicle is effected. The average horse was found to have a capacity for three hours' work per day at the rate of seven miles per hour. The authors state: "The figures given above speak for themselves, and would appear to be most effective argument in favor of adopting electric automobile delivery service."

A popular notion exists that carriage batteries and electric batteries are charged with a certain number of miles. It requires only a second thought to see the error and delusion embodied in this idea. It is evident that a battery when fully charged contains not miles but electrical power, which may be expressed in horse power, and which is proportional to the size and capacity of the particular battery in question. With this in mind, it will be readily seen that the statement that carriage batteries contain a capacity to run a given number of miles would only be true when a certain standard pavement or roadbed is considered, because it is found that it requires very much more battery power to drive a carriage a mile on a soft, uneven and hilly road than it requires on a smooth, hard and level road. It should always be understood that a standard pavement or roadbed is considered.

Again, for instance, where two motors are employed the power and efficiency is divided,

requiring, it is found, a larger amount of power from the battery to drive a vehicle of given weight a mile upon standard road; again, the mechanical condition of the bearings, or amount of rolling friction present in carriages of different makes also varies. It is evident, therefore, that a number of important considerations should be included in any attempt to give a definite or prescribed mileage capacity to electrical vehicles and their batteries.

(To be continued.)

#### THE DEVELOPMENT OF THE TELE-PHONE \*

BY ED. L. BARBER.

In responding to the invitation of the committee to make an address on "The Development of the Telephone," I find myself in a number of difficulties, one of which is the committee failing to suggest just at what point in the history of the human race I was expected to begin my disquisition on the subject. There was great danger of my starting in several centuries back and gracefully sliding down the "Rock of Ages" until I struck the threshold of the twentieth century, but I wrestled hard with the temptation, and I believe better judgment has prevailed, so omitting all reference to the crude apparatus which is said to have been used by the semi-civilized denizens of the Orient centuries ago, passing over the pair of tomato cans or baking powder boxes and string attachments which, as boys, we used to communicate from the barn or wagon shed to the house, I will plunge into the telephone as it comes within the memory of the youngest of my auditors.

The telephone as we know it, to-day is a product of the last quarter of a century. When first placed upon the market, few people had the slightest idea of the important part it would play in the business and social life of the people. It was generally considered but little better than a toy, and for a number of years subsequent to the granting of the patents covering its important features it did not come into anything like general use. As soon as its utility was recognized it passed into the hands of a corporation, which waxed wealthy and grew corpulent from the money exacted from those who were, perforce, compelled to pay whatever sum was demanded for the service. During the time this state of affairs existed, or up to the year 1895 when the independent movement was fairly started, there were comparatively but few telephones in use, the monopoly believing the telephone to be a luxury, and for the few, charging such rates that it was impossible for the many who desired to indulge, but in this year, when several of the basic patents expired, so that whoever desired could both manufacture and use the telephone, then was recorded the birth of the independent telephone organization, which has grown to such magnificent proportions as to cause the assembling of such a Convention from the four corners of this vast country as we are here enjoying.

Then it was discovered that just as good, if not better, apparatus could be manufactured by the independents as was in use by the monopoly, and factories were started, at first only two or three, but as the demand increased more were added, until now there are some fifty or more in the manufacture of telephones and

<sup>\*</sup> Paper read at the Fourth Annual Convention of the Independent Telephone Association of the United States at Cleveland, O., June 12-14, 1900.

switchboards alone, to say nothing of the many other branches of the industry, and I am told by the people of this branch of the industry, that the demand for their goods is increasing so rapidly that it is almost impossible for them to supply it.

At the time of the advent of the independent movement had those who were in possession of the telephone interests of this country been disposed to be half way fair with the people, the independent telephone movement would never have been born, and those of us who are here assembled to-day would never have had the pleasure of communing with each other, nor the experiences we have had since we engaged in this line of human endeavor. But they were not so disposed. They seemed to believe that they had everything their own way, that the telephone was invented only for the rich of the populous centers of our country, and by their acts of exclusion deprived nine-tenths of the population of our country the privilege of enjoying this greatest of modern improvements. The man of moderate means could not afford to pay the exorbitant prices charged, and even those of wealth, who could afford it, but who chanced to live outside the larger cities, were likewise denied the boon they sought.

The advent of the independent telephone movement, however, changed all this, and within the past five years this movement has taken such strides that nearly every village of the land is connected with the great outside world by one or more telephone lines, and the homes of multiplied thousands of those residing on farms far distant from the centers of population enjoy the same benefits on this line as do their heretofore more favored city cousins. The telephone is no longer a luxury to be enjoyed only by the rich, or those whose business interests compelled them to pay whatever price the monopoly demanded for its service, but it has become an everyday necessity in both the home and the business office, almost as necessary to the home as the cook-stove, and as essential to the business office as a desk or typewriting machine. All this has been brought about by the movement which we represent, and there are some of us here who are vain enough to think that we have had something to do with the shaping of this most desirable result.

Again, to refer to the apparatus we use. When the first independent exchange was constructed, the monopoly laughed long and loud, and indeed there was some reason for their hilarity. The apparatus used was crude and it was inefficient, all of the basic patents had not expired, and the earliest independent exchanges were compelled to use instruments without a battery attachment, and it was soon discovered that such equipment was inadequate and could not fill the bill. But the day came when the last of the patents ceased to be prohibitive, and then the monopoly changed its tune, and has been changing it until to day it is a most dismal dirge that is wafted over the land from the scene of previous rejoicing down on Milk street in "Old Boston Town."

To-day we surpass them in the number of exchanges in operation and in the number of points reached, and in the territory between the Alleghany and Rocky Mountains in the number of instruments in use, and have an equipment in every respect superior to that used by the monopoly, and they are taking lessons from us in the construction of telephone plants.

Our instruments (I do not refer to any particular manufacturer's output, for there are a large number of really excellent instruments on the market to-day, made by as many different houses) are fine specimens of mechanical skill and workmanship, and fulfill to the letter all the demands made by an exacting public upon them, and are to-day giving better service in a thousand towns and cities throughout this broad land than are the instruments of that monopoly which has repeatedly informed the people that we do not know how to build telephone plants, do not know how to operate them, and are unable to secure either telephones or switchboards which will stand the test of service.

But the people have learned some important lessons along the telephonic lines during the four years which are covered by the history of this independent movement. They have learned that we are their friends and that whatever we tell them they can rely upon, while the wild statements of our adversaries have been, time and again, proven false. They have learned that if they want the best service, the most accommodating service, they must come to us, and that it is to our efforts that must be credited the fair prices that predominate, and that to us belongs the credit of making the telephone what it is to-day — a blessing to all the people everywhere.

Now a word as to statistics in the movement. I think most of us are familiar with what was done up to the meeting of our Association last June in Chicago. To-day we have, as nearly as I am able to ascertain, about 3,000 exchanges with a total number of 1,000,000 telephones and many thousand miles of toll line. so you see we have increased even more rapidly than in any previous year and that the independent development of the telephone is by no means at a standstill. Since we have thus succeeded, my idea is that we should still continue the same policy, continue to avoid the mistaken idea of the original company that the telephone was for the few, to give the best possible service at the least possible cost, to avail ourselves of a practically unlimited demand, and to so conduct our affairs, that our patrons will regard our interests and theirs as identical and equally deserving of consideration. Even now the use of the telephone is in its infancy when we consider what has been done in the past few years. Its growth has only begun. Ultimately the telephone will be in every home as a convenience, a time and money saver, and a "necessity" in the ordinary affairs of men.

#### THE 3,000-VOLT THREE-PHASE RAIL-WAY AT COLICO, ITALY.\*

BY E. K. SCOTT.

From an electrical novelty point of view probably the most interesting exhibit at the Paris Exhibition will be the plans, details of the electric cars, etc., for the 65 miles of electric railway which the Adriatic Railway Company are laying down at Colico, Italy, the bare conductors from which the trains draw their energy being worked at a pressure of 3,000 volts.

The objects to be exhibited include details of the line equipment, models of a transformer sub-station and a parlor motor carriage of 300 hp., besides switches and other details. These will be exhibited in a pavilion which is being specially built by the Adriatic Railway Company, and which will be ready by the end of July. The line itself will not be ready for use before the end of 1901, but Messrs. Ganz & Co. erected some six months ago an experimental line of 1.6 kilometers at Buda-Pesth on which all the details are being carefully worked out.

The lines being converted are those of Lecco Colico, Colico-Sondrio, and Colico-Chiavenna, which are at present worked by steam.

The necessary power will be derived from a 98-foot fall on the River Adda; the head race is three miles long, and at the power station at Morbegno (10 miles from Colico) 10,000 h.p. will be available. It is proposed to erect three units of 2,000 hp. each, consisting of turbines and Ganz three-phase alternators, generating current at a pressure of 20,000 volts and 15 periods per second.

At intervals of about 61 miles there will be 10 transforming stations, reducing the pressure to 3,000 volts on the trolley wires, which are 8 mm. in diameter. Both the primary and secondary lines are on the same poles, except in the tunnels where the lines are fixed to the The two overhead wires are three feet apart and the rails form the third conductor. The passenger motor cars are to have four motors, each 150 h.p. Two motors only will be in circuit at the maximum speed of 38 miles an hour, the other two being thrown into circuit when the train of 65 tons weight ascends gradients of above 1 in 100 at 19 miles per hour. When the four motors are, in use, two of them take current, not from the trolleys, but from the other two motors; in this way it is said that the speed is reduced to one-half without loss of energy. There are to be five passenger trains and two freight trains, the freight trains being run at about half the above speeds and having a maximum capacity of 200 tons, they are hauled by a 600 h.p. locomotive.

The whole of the line is divided into single parts, each of which is supplied with current from the sub-station next beyond it, this being done to ensure greater safety in working. When one block signal indicates "stop," the next part of the line is not supplied with current, and in case of interruption of current the Westinghouse brake comes on automatically, an important feature on a line with steep grades.

This line is of international importance, because the Adriatic Railway Company is one of the two largest railway concerns in Italy, controlling as it does the whole of the railway network down the eastern portion of the kingdom.

The decision to undertake the work is the direct result of the successful operation of a short length of electric railway from Milan to Monza, and it is further interesting to note that the company are so pleased with the way things are shaping that they already contemplate equipping electrically the Bologna Firenze line, which is several hundred miles long, and crosses the highest points of the Appenine range of mountains.

The Mediterranean Company, who control the railway system on the west of Italy, are following suit, and have already obtained the royal decree to a project which will require 10,500 hp. Electrical engineers, and also railway engineers, will therefore need to watch these Italian developments closely, for as was the case with the Tivoli Rome transmission. it is again falling to Italy to give the engineering world a lead.

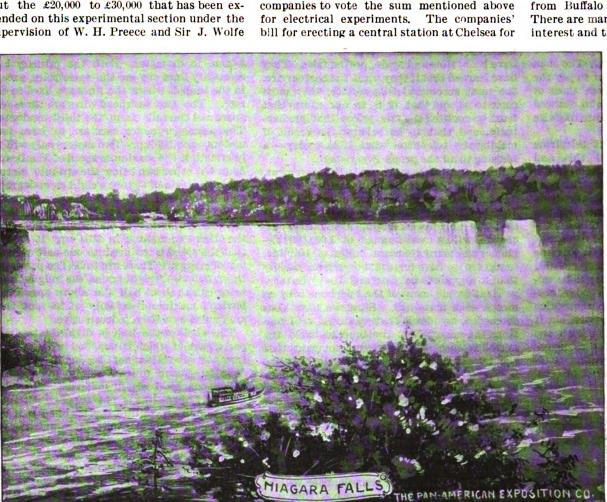

<sup>•</sup> From the "Electrical Review." London.

#### LONDON NOTES.

[From our London Correspondent.]

#### Opening of London Underground Electric Lines.

There was a press inspection of the electrical section of the Metropolitan Underground Railway between Earl's Court and High street, Kensington, on the 18th, and the train was to be brought into regular service along with the steam trains running over the same line three days later. This electrical section, which is about a mile long, has been equipped without in the least interfering with the existing line. The gradients encountered are heavier than on any other part of the railway. It has been stated from the first that these experiments were absolutely necessary before the conversion of the entire line to electrical working, but the £20,000 to £30,000 that has been expended on this experimental section under the supervision of W. H. Preece and Sir J. Wolfe and the introduction of fans, but these have failed to remedy the evil. Ordinary locomotives fitted with condensers were adopted, and in the first instance the fuel used was coke, but subsequently it was found necessary to resort to coal, and that is the fuel now employed over all the line except this one mile electrical section. About three years ago the state of the tunnels in the matter of want of ventilation inclined the Board of Trade to appoint a special committee to thoroughly investigate the question. Their report made a most elaborate document of over 150 pages of expert and other evidence pointing to the adoption of electrical working as the only effectual remedy for the nuisance. The recommendations of that committee required immediate steps to be taken within a certain time for electrical working, and this is really what led the two companies to vote the sum mentioned above

Barry is looked upon as unnecessary expenditure because electric traction was bound to come on this choky railway. However, the experts will doubtless observe certain things from these experiments which will aid them in carrying out the conversion of the entire line. The train was built by Messrs, Brown Marshalls of Birmingham, and the electrical equipment for it, the track and the temporary power house was supplied by the Siemens Bros. Co. It is perhaps of interest to mention that this railway, which has gone dividendless so far as its ordinary stock is concerned for about 20 years, was originally intended to be worked by hot-water locomotives, and this fact accounts for no provision being made for ventilation. The hot water experiments made before the line was quite completed proved a failure and this idea was abandoned. At certain intervals more or less elaborate works have been carried out in the way of new openings, the operation of the whole system by electricity is now waiting for Parliamentary sanction.

The new train weighs 180 tons, which includes 54 tons for a motor carriage at each end of the train, and 18 tons per coach.

The Central London Railway is now completed and the generating plant and trains have been undergoing trial runs. In a few days now the opening of the line will be announced. The trains on this line will weigh only 150 tons.

THE water of the Flint Creek Falls in Anaconda, Mont., has been completely harnessed and is now running the Bi-Metallic and Granite Mountain silver mines and mills at Granite and Phillipsburg in that State by electricity. The electric light plant is situated at the foot of the falls and between seven and eight miles on an air line from the Bi-Metallic mill at Phillipsburg.

### A GREAT AUXILIARY ATTRACTION TO THE PAN-AMERICAN EXPOSITION.

The importance of the great Falls, Rapids and Gorge of the Niagara River as auxiliaries to the many and varied attractions of the Pan-American Exposition to be held in Buffalo, May 1 to Nov. 1, 1901, cannot well be overestimated. In its immense flow of waters, its grand scenery and its historic lore, the Niagara is one of the most renowned rivers of the world. Its great cataract has defied the descriptive powers of poets and philosophers and baffled the delineative skill of painters and photographers. The grandeur of their environment renders the Falls perennially interesting at all seasons of the year and very few of those who visit the Pan-American Exposition but will desire also to visit them. The trip from Buffalo can be made in half an hour. There are many points of view and places of interest and the visitor can plan his itinerary

> according to the leisure time at his disposal. If time will permit, the cataract should be viewed from both sides of the river and trips should be made the length of the Gorge, either along the cliffs above or over the trolley road which runs close to the water's edge. Perhaps the most comprehensive near-views of the Falls are those obtained on the Canadian side of the Gorge, especially that from Falls View station. Here is a complete panorama, embracing the rushing and turbulent currents of the upper rapids and the whole sweep of the falling waters, reaching from end to end nearly four-fifths of a mile, with the great Horseshoe Fall in the foreground separated by Goat Island from the American Fall, which is 158 feet high, and 1,881 feet wide. In the river below plies the little steamer "The Maid of the Mist," carrying visitors close to the foot of the Falls at various points and affording splendid views of the descending waters. The State Reservation on the American side and Queen Victoria Park, across the river in Canada, are delight-

ful observation grounds, both open for the enjoyment of the public free of any charge. To the scientific visitor the electrical power development at the Falls will be especially interesting. On the American side there are two great corporations utilizing the current of the Niagara River for developing electric power used in many industries at the Falls. The power thus generated by one of these corporations is also transmitted to Buffalo, 25 miles distant, for use for the electric lighting of the city, for operating a great electric trolley car system and in many important manufacturing establishments. The power thus transmitted will likewise be extensively used for the purpose of the Exposition.

#### THE AGRICULTURAL BUILDING.

The agricultural industry will have a fitting setting at the Pan-American Exposition. A commodious and richly proportioned building will be devoted exclusively to the interests of

the farm. So wonderful has been the development of agriculture and so marvelously has the productivity of soils been increased by the application of scientific methods it is no exaggeration to say that, potentially, the cultivated acreage of the world has been doubled within a few years. Science has indeed made two blades of grass to grow where but one grew before. More than that, it has, by irrigation, made the deserts to blossom as the rose.

The Agricultural Building will stand opposite the Manufactures and Liberal Arts Building on the north side of the Mall, its longest facades looking to the north and south. On the east will be the live stock exhibit, to which about ten acres are devoted. Northward will be the Stadium covering another ten acres. On the west is the Grand Court with the Electric Tower, 348 feet high, and the Electricity Building just beyond. There are four broad entrances to the building. Opposite the north-

ern entrance is an artistic bridge crossing the Grand Canal. Vaulted loggias connect the east and west entrance with the main entrance on the south, and from these elevated promenades the people may view the throng of sightseers upon the Mall. The low tiled roof overhangs the walls eight feet, making a deep shadow over the richly decorated cornice. The lattice is fastened to the dome, ceiling and walls, then, on a background of blue, grapevines produce the effect of looking through to the open air. The southern entrance, 30 feet wide, is flanked on both sides by large groups of statuary. Above

the doors and following the lines of the arch, panels will be painted to represent the signs of the zodiac. On either side of the vestibule are large niches affording places of rest and retreat from the crowds. On either side of the south entrance at the intersection of the eaves of the loggia are large consoles surmounted by figures representing the "Sower" and "Reaper." The Agricultural Building is 150 by 500 feet, and contains exposition space to the amount of about 75,000 square feet.

#### PARIS LETTER.

(Special Correspondence of Electricity.)

### Elevators and Elevating Inclines at the Exposition.

There are twenty-seven inclined rolling elevators in operation at diverse places in the Exposition, twenty are to be found on the Champ de Mars and seven at the Invalides. The Plat Company has installed seventeen of the Hallé system in Paris at the Magazines du Louvre and five others have been placed by M. Jules Le Blanc, while a like number were put up by the old Cail establishment, which is, strictly speaking, the French Society of Mechanical Constructors. I will describe the details of their construction later. As to elevators, all systems are represented, only five of them are operated electrically on the Champ de Mars. Two were built by Stiegler, and one each By Messrs. Gallois, Rousseau-Lecoq and Mocomble.

#### Moving Sidewalk and Electric Railway.

The moving sidewalk, which has been adopted by the Exposition authorities, is the pro-

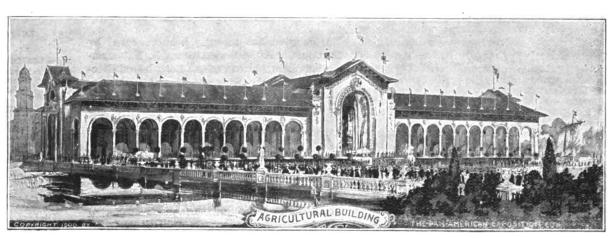

ject of Messrs. Blot, Guyenet and Mocomble, and was built by the Compagnie de Transports Electriques on the Exposition grounds. This firm also operates at the same time the electric railroad; the route is practically the same as that of the moving sidewalk. The latter is 3,400 meters long and starts from a point on the Bourdonnais avenue in the Exposition grounds. It follows this avenue through the Exposition grounds and passes outside via the Motte-Picquet avenue, as far as the Esplanade de Invalides. It moves along inside the latter enclosure of the Invalides and follows the Fabert road, passing near the railway station at the Invalides, and then follows the Quai d'Orsay as far as the Champ de Mars, returning to its starting point on the Bourdonnais avenue, thus making a continuous circuit but running in an opposite direction to the electric railway. These two routes form a closed circuit and there are nine stations along the

platform by means of a driving gear connected to the differential gears.

The electric energy for operating both the platforms and the electric railway is generated at the Moulineaux station of the General Traction Company, which contains three-phase alternating Westinghouse generators of 800 kilowatts each. These three-phase currents are of 3,000 volts and are carried by primary mains to a transformer station located on the Quaid Orsay at the corner of the Bourdonnais avenue. There are two groups of rotary transformers in this station, of 600 kilowatts capacity each, also commutating machines of like power.

The secondary system of distribution is in cable form and laid underground. The cable section is 100 square millimeters and it is fed from six copper bus bars of  $33 \times 8$  mils.

The electric railway is also a belt line and runs parallel to the moving platform, some-

THE AGRICULTURAL BUILDING, PAN-AMERICAN EXPOSITION.

routes of steel construction with stairways.

The moving platforms are composed of two moving sidewalks, each going in the same direction but at a differential rate of speed of four and eight kilometers. These two parallel sidewalks are supported by an iron framework rigidly supported on wooden timbers with their bases deeply embedded in a solid foundation. These supports are placed from 9 to 15 The distances vary with meters apart. the local conditions of the route, and they carry stringers composed of T-iron trellis work, joined by bridging cross beams fastened by means of bracket supports. Upon this framework is placed the integral part of the platform, which is composed of sections of covered four wheel trucks, boxed in and all joined together.

Motion is transmitted to the wheels of the moving platform through an axial shaft placed alongside of the axles of each truck and underneath the truck covering. Each of these axial shafts are connected to the preceding one on the next truck by a hinged joint connection to allow of perfect freedom in rounding curves.

The moving mechanism is composed of a series of wheels and axles operated by an electric motor placed between the rails of the fast moving platform. A coupling shaft with a universal joint is geared to the fast moving platform and directly operates the low speed platform. The diameter of the gear wheels on this coupling shaft are in proportion of two to one (0.70 and 0.35 meters in diameter). There are 175 electric motors of 5 hp. each, connected in series and operated by a continuous current of 500 to 525 volts at a speed of of 725 revolutions per minute, which operates the moving

times close to it and at other locations a little below. Near the Alma bridge the track runs underground and also passes under the bridge of the Invalides through a viaduct. The minimum radial curvature is 40 meters and the average grade is four millimeters per meter. The gauge is one meter and the rails weigh 27 kilograms per meter and are of the Vignole The current is taken from a lateral third rail of the same type as the track rails; it is supported on porcelain insulators placed near the extremities of the ties. The rail joints of the third rail are bonded by means of copper bonds fastened to the web by means of copper rivets. These bonds also subserve the purpose of fish plates. Each train is composed of a motor car with two trailers, and has a carrying capacity of 205 passengers, with seating capacity of 110 and standing capacity of 95. The total length of the train is 30 meters. Its weight empty is 18 tons. The motor cars are 12 meters long and the motive power is four Westinghouse generators of 31 hp. each. The motor cars have a carrying capacity of 82 passengers, 46 seated, 36 standing. The ordinary cars are 8.30 meters long with a seating capacity for 62. All of these cars are furnished with two sets of brakes, a common hand brake and a compressed air brake. The total equipment in service comprises seven trains with a total of twenty-one cars, seven being motor cars. The trains follow each other under a headway of 90 seconds, making forty trains an hour. The speed is 17 kilometers per hour and there are five stations along the route.

This electric railway has only been in service for a few days. The moving platfor:n has already had several interruptions in its service.

The circuits have had accidents happen to them, and once the trucks ran off the rails and it took several hours work to replace them. The principal danger that exists and which has been difficult to overcome is a short circuit that readily sets fire to the woodwork of the road and to the moving platforms. Let us hope that this accident will not occur again.

#### CANADIAN NOTES.

Considerable comment is said to have been caused in Montreal municipal circles by the application from the Montreal Terminal Railway (the old Belt Line) to continue its service through the city. The application was referred to the road committee of the city council, and will probably be resisted by the Electric Street Railway Company on the ground, frequently urged heretofore, that the granting of such permission as that requested, would be a violation of the contract between the company and the city. However, legal opinions have been given to the effect that under its contract, the Street Railway Company has no monopoly of the city streets. It appears that if the Terminal Company obtains the desired permission, it will construct one or two electric car lines from one end of the city of Montreal to the other, connecting with its suburban system in the east end of the island. Some time ago this company endeavored to make arrangements with the railway company to run Belt Line cars to the center of the city or to lease special cars of its own connecting the Belt Line suburban service with the center of the city. This being refused, the Terminal Company now seeks to build city lines of its own, as it is empowered to do under its character from the Dominion Parliament. The proposal meets with much favor as it will provide a useful competion in the other transmission. tion in the street car service.

The council for the town of Hespeler, Ont., has passed a by-law to raise \$10,000 by debentures for the purpose of taking over the Shantz electric light plant in operation in that town.

The Standard Electric Light Company has . been organized at Napance, Ont., and has taken over the electric light and power business of Mr. J. R. Scott of Napanee. It is understood that the extension of the plant is under consideration.

Messrs. Dean & Shibley, bankers, of Napanee, Ont., are negotiating for the purchase of the interests of the Trenton & Belleville Electric Water Power Company, the Belleville Gas Works, and the Belleville Electric Street Rail-way. If secured, it is the intention to extend the railway, and to make improvements to the lighting and power plants.

#### Proposals Invited.

The War Department, through the Corps of Engineers, is inviting sealed proposals until July 18, for furnishing a quantity of electrical supplies, such as C-S switches and switchboxes, porcelain cut-outs, iron armored conduit, and flexible iron conduit. Full information will be furnished upon application to Lieut. John S. Sewell, Washington, D. C.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended June 23:

Antwerp, 73 packages, \$2,974; Australia, 182 packages, \$7,347; 1 case, \$21: Barcelona, 2 cases, \$166; Brazil, 41 cases, \$4,124; Bristol, 13 cases, \$3,000; British Possessions in Africa, 109 packages, \$2,975; British West Indies, 19 cases, \$272; British Guiana, 6 cases; \$456; Central

America, 34 cases, \$540; Chili, 29 packages, \$1,049; 3 cases, \$17; Christiania, 105 packages electric motors, \$2,300; Cuba, 58 boxes, \$2,215; Dutch West Indies. 1 package, \$19; Glasgow, 3 packages, \$10,000; Hamburg, 83 packages, \$8,121; 7 cases electric instruments, \$10,100; Havre, 2 cases, \$215; 150 packages, \$5,842; 1 electric motor, \$500; 2 cases, locomotive parts, \$25,003; 4 cases automobiles, \$4,000; Hong Kong, 10 packages, \$291; 5 cases, \$318; Leeds, 1 package, \$125; Liverpool, 169 packages, \$27,956; London, 243 packages, \$13,424; 3 cases, \$55; Mexico, 51 packages, \$812; 2 automobiles, \$900; New Castle, 29 packages, \$2,800; 2 cases, \$115; Peru, 22 cases, \$973; Porto Rico, 40 cases, \$4,098; Rotterdam, 6 packages, \$174; Southampton, 6 packages, \$90; Stettin, 57 cases electric fans, \$2,193; St. Petersburg, 1 case, 503; 1 package, \$153; U.S. Colombia, 6 packages, \$193; 12 cases, \$2,146; Venezuela, 63 packages, \$190.

#### LEGAL NOTES.

A decision has recently been rendered by the Court of Appeals at Albany, N. Y., affirming judgment in favor of the Long Island Electric Railroad Company and the National Express Company against which Aaron De Grauw brought suit. The question decided in the affirmative involved the right of surface roads to operate freight and express cars over their tracks under their charters.

The Canadian Electropoise Company of Toronto is a party defendant in a suit for \$10,000 damages instituted in the Exchequer Court of Canada. The plaintiff is the Aminarium Company of New York, and the action is one in which the priority of a patent on an electrical cure-all appliance is at issue. The American company received the idea from Dr. Hercules Sanche, of Montreal, three years ago, and it is claimed that the Canadian company and another of the same name in New York have since applied it to their own electrica appli-

Vice-Chancellor Grey of Trenton, N. J., rendered his opinion a short time ago in the application for preliminary injunctions against the Camden & Trenton Railway Company, which were filed by Harry S. Ehret and Mary N. Baldwin, both of Beverly. The vice-Chancellor refused to grant the injunctions and dismissed the order to show cause.

#### PERSONAL MENTION.

Dr. Perrine of the Stanley Company and F. W. Roebling left Springfield, Mass., this week for a business trip to the West. It is said the object will be to effect an amalgamation of the Stanley and a Western Electric Company making direct current machinery.

Mr. McVay, city electrician of Wichita, Kan., writes that he will arrive in New York about the middle of July to join the representatives of the American Institute of Electrical Engineers who will visit the Paris Exposition.

#### INCORPORATIONS.

The Akron Electrical Company. Akron, O. Capital stock, \$48,000. Incorporators: Edwin E. Andrews, of Akron, and

The Pittsburg Electrical and Machine Works, Pittsburg, Pa. Capital stock, \$60,000.

The Electric Light & Heat Company, Old Forge. Pa-to furnish light, heat and power. Capital stock, \$10,000. Incorporators: T. B. Jones, T. Pickrell, J. Surber, all of Old Forge; I. F. Price of Moosic, Pa., and W. H. Nalor of Dur-

The United Storage Battery Company, Jersey City, N. J. -to supply electric motive power. Capital stock, \$500,000 Incorporators: Albert W. Stringham and Frank Miller, Brooklyn; P. Andrew Hohn, Hoboken; Alexis C. Fern and Owen T. Bugg, New York.

The Central Electric Company, Newark, N. J .- to furnish electric light, heat and power. Capital stock, \$100,000. Incorporators: P. H. Jackson, D. Farrand, V. H. McCarter. A. Riker and L. D. H. Gilmour, all of Newark.

The Bristol Electric Light Company, Midland, Mich. Capital stock, \$10,000.

The Ferris Electric Company, Farmington, Ill.-to operate us, steam, electric and telephone plants. Capital stock, \$10.000. Incorporators: W. J. Ferris, J. Scribner and T. Ferris all of Farmington.

#### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway. New York City, N. Y., or 659 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED JUNE 19, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

652,003. Electric Railway. William Kingsland, London, Eng. Filed Sept. 8, 1899.
 652,039. Trolley. George W. Perry, Peoria, Ill. Filed Feb. 6, 1900.

#### ELECTRIC LIGHTS AND APPLIANCES.

- ELECTRIC LIGHTS AND APPLIANCES.

  651,866. Incandescent Lamp. Isidor Kitsee, Philadelphia, Pa. Filed March 2, 1900.

  651,985. Electric-Arc Lamp. Allyn B. Walton, Lorain, O. assignor to the National Vapor Stove & Manufacturing Company, same place. Filed Dec. 21, 1899.

  652,194. Electrical Incandescent Lamp. Max von Recklinghausen and Adolf Vogt, London, Eng., assignors to the Nernst Electric Light, Limited, same place. Filed Nov. 6, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

- 651,909. Electric Motor. Henry O. White, Boston, Mass. Filed Oct. 18, 1899.
  651,945. Electric Motor. Clifton L. Bundy, Philadelphia, Pa. Filed June 6, 1898.
  652,116. Rheostat. Thomas F. Jordan, New York City. Filed March 20, 1900.
  652,151. Automatic Electric Switch. Phill S. Tirrill, Groveton, N. H., assignor of one-half to Fred W. McDonald, same place. Filed Sept. 23, 1899.

#### TELEPHONES AND TELEPHONE APPARATUS.

- 651,817. Telephone Toll Apparatus. John T. Belanger, Detroit, Mich., assignor of one-half to Frank H. Clarke, same place. Filed Nov. 20, 1899.
  652,084. Hotel Annunciator System. Clayton B. Clark, Sing Sing, N. Y., assignor to the Clark Electrical Company, same place. Filed June 20, 1899.

#### MISCELLANEOUS.

- 531,843. Phonograph. Emine C. Geneux, Jeanerette, La. Filed June 9, 1899.
  551,849. Electrolytic Apparatus. Max Haas, Aue, Germany. Filed May 26, 1899.
  651,850. Programme-Clock. William H. Hall, Chicago, Ill., assignor to Alvarado T. Benson, Harry J. Cassa Iay and Mattle A. Hall, same place. Filed Sept. 6, 1898.
  651,853. Machine for Making Electrodes for Storage Batteries. William W. Hanscom and Arthur Hough, San Francisco, Cal., assignors to James O'B. Gunn, same place. Filed April 6, 1899.
  651,908. Magnetic Chuck. Oakley S. Walker, Worcester, Mass. Filed Feb. 23, 1899.
  651,916. Furnace for Producing Calcium Carbid. John Zimmerman and Isedore S. Prenner, Chicago, Ill. Filed June 8, 1899.
- 8, 1899.
  936. Indicating-Key for Selective Signals. Charles R. Scribner, Chicago, and Frank R. McBerty, Evanston, Ill., assignors to the Western Electric Company, Chicago, Ill. Filed July 25, 1998.
  978. Electric Belt. William C. Fedwick, Des Moines. Ia., assignor to M. V. Sedwick, Grinnell, Ia. Filed April 5, 1899.

- 1a., assignor to M. V. Sedwick, Grinnell, Ia. Filed April 5, 1899.
  652,124. Controlling Electric Motors and Apparatus Therefor. Henry Leitner. London. Eng. Filed July 10, 1899.
  652,152. Phonographic Clock. Erwin Treitschke, Dresden-Blassewitz, Germany. Filed July 15, 1899.
  652,187. System of Electrical Distribution. Sigvald Krohn, Berlin, Germany. Filed Nov. 2, 1899.
  652,214. Apparatus for Measuring Consumption of Electric Currents. Cesar R. Loubery. Paris, France, assignor to himself, Emmanuel Francois and Henry Kunkelmann, same place. Filed Feb. 17, 1899.
  652,217. Electric Belt. Michael A. McLaughlin, Los Angeles, Cal. Filed Dec. 27, 1898.
  652,223. Electrical Warp Stop Motion for Looms. Henry I. Harriman, New York City. Filed June 14, 1899.
  652,223. Reception and Translation or Retransmission of Telegraphic Signals. Alexander Mulrhead, London, England. Filed March 15, 1900.
  652,230. Art of Reducing Attenuation of Electrical Waves and Apparatus Therefor. Michael I. Pupin, Yonkers, N. Y. Filed Dec. 14, 1899.
  652,231. Art of Reducing Attenuation of Electrical Waves. Michael I. Pupin, Yonkers, N. Y. Original application filed Dec. 14, 1899. Divided and this application filed Dec. 14, 1899. Divided and this application filed May 28, 1900.

### THE TELEPHONE WORLD.

Copenhagen, Denmark, Telephone Exchange.

One of the largest and finest telephone exchanges in North ern Europe is the one in Copenhagen, Denmark. The building was especially erected for the purpose, two large halls being reserved for the switchboard rooms. In 1896 the exchange was fitted up in the top hall, which is large enough to accommodate a board with a capacity of 10,000 subscribers. The number of subscribers was then 5,600, except the junction and long distance lines, and has since been largely extended. The room is splendidly decorated with busts and paintings, and the boards are placed in two straight lines; the ceiling, being glass framed, is arched across, thus giving a fine overhead light. The ventilation is especially cared for, the cold air being first forced through a fine sieve, which keeps out the dust, and is then kept at an even temperature by means of fans circulating it through the switchboard room, and finally it goes out at the other end of the room. In one end of the hall there is a balcony, from which visitors are allowed to watch the operation of the board, and they are thereby able to get an idea of the work done by the many times much abused operators. The board itself was designed by the company's own eminent engineer-in-chief, Mr. Jensen, and made by L. M. Ericsson & Co., of Stock-holm, Sweden. Each subscriber has his own drop, key and cord, so the answering is done simply by pressing down the key, and the wanted connection is given by the cord, which makes the service extremely rapid. The called subscriber's drop is automatically cut out during the conversation by a At the annual meeting of the stockholders of the Cleveland Telephone Company, recently held in Cleveland, it was decided to increase the capital stock \$1,000,000 in order to provide for contemplated improvements to the system. The capital stock of the company has been \$3,000,000, and it wa increased to \$4,000,000. The company contemplates nine additional branch exchanges, some of which are already in process of construction. The following board of directors was elected by the stockholders: Charles E. Adams, Charles J. Glidden, Lowell; John E. Hudson, Thomas Sherwin Boston; Frank F. Hickox, Alfred B. Hough, Lee McBride, William J. McKinnie, James P. McKinstry, Edward P. Williams, Edward P. Wright, all of Cleveland. The board of directors organized by the election of the following: President, Charles J. Glidden, Lowell, Mass; vice-president, J. P. McKinstry, Cleveland; treasurer, Charles A. Grant, Lowell, Mass.; secretary, George B. Perham, Lowell, Mass.

The Michigan Telephone Company (Erie system) successfully laid on June 2!, a cable 3½ miles long connecting the Island of Mackinac with St. Ignace. The cable has 8 copper metallic circuits equivalent in conductivity to No. 12 copper wire and 2 copper metallic circuits equivalent in conductivity to No. 8 copper wire of the same size as used on the Boston-Omaha Long Distance circuits. The following officials of the Michigan Telephone Company were present at the laying of the cable: Chas. J. Glidden, Chas. E. Adams, H. J. Pettingill, Jas. H. Mills, J. W. C. Pickering, John B. Stauffer, F. A. Cutting, George B. Perham, Chas S. Tuckerman. Telephone

The N. Y. "Commercial" publishes a dispatch from Minneapolis, Minn., which states that a deal is on by the terms of which the property of the Mississippi Valley Telephone Exchange, which has made a most plucky fight for three years against its great competitor, the Northwestern Telephone Exchange, a lessee of the Bell Company, is to be controlled by a company of local capitalists. The new company includes five or six bankers, business men of Minneapolis, and three St. Paul capitalists. They made a proposition to J. C. Hubinger, owner and general manager of the "Mississippi," who spent over \$600,000 in establishing telephone exchanges in Minneapolis and St. Paul. It is the intention of the new company to put in as much more money before the end of the year, to vastly increase the efficiency and scope of the present exchange. It now has in operation in Minneapolis about 2,800 telephones and over 4,500 subscribers; in St. Paul about 1,000 'phones and over 3,000 subscribers; in St. Paul about 1,000 'phones and over 3,000 subscribers;

The Pittsburg & Allegheny Telephone Company has purchased a site for the new Allegheny exchange at Parkway and East Diamond street, Allegheny, Pa, for \$25,000. A new brick exchange building costing \$25,000 will be started at once and completed within ninety days in order that the Allegheny subscribers for the independent instruments may early have the use of 'phones. The company has every pole in place in Allegheny and over 60 per cent. of the subways completed, although the ordinance granting privileges for the new system was only passed last March. The company now has 5,700 subscribers and is getting new ones at the rate of 125 every week.

The Northwestern Telephone Exchange Company has extended the minute service from Barnesville, Minn., and all stations on its lines to the Twin Cities.

The Citizens' Telephone Company of Grand Rapids, Mich., has bought the Peninsular system, comprising several exchanges and more than 100 miles of long distance wires in Southern Michigan.

The Interstate Telegraph and Telephone Company, chartered in New Jersey and Pennsylvania, is building a telephone line between Norristown and Trenton.

#### TELEPHONE INCORPORATIONS.

The City Telephone Company, Tabor, Iowa-to operate a telephone exchange. Capital stock, \$12,000. Incorporators: S. Lindsay, M. T. Davis F. Anthony, J. C. Rhode, L. McDaniel, A. A. Feiling, all of Tabor.

The Chamberlain Independent Telephone Company, Webster City, Iowa—to operate a telephone exchange. Capital stock. \$20,000. Incorporators: A. W. Chamberlain, J. W. Lee, E. L. Chamberlain, A. G. Bremer, all of Webster City.

The Kraft Combination Telephone Company, Chicago, Ill, Capital stock, \$375,000. Incorporators: Charles H. Kraft, William L. Rohrer, and I. M. Hamilton.

The Hamler Telephone Company, Hamler, O.—to construct and operate a telephone system. Capital stock, \$10,000. Incorporators: F. D. Quintis, W. S. Barhite, A. M. Jackson, J. I. Montgomery and O. Higgins.

The Louisa Telephone Company, Louisa, Va. Capital stock, \$25,000. Incorporators: J. J. Porter and F. W. Sims, both of Louisa.

The Independent Telephone Supply Company, Chicago, Ill.—to manufacture telephone supplies. Capital stock, \$2,500. Incorporators: F. B. Macomber, G. S. Whyte, A. F. Coles, all of Chicago.

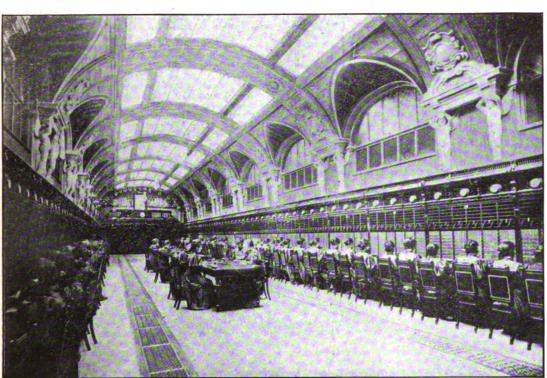

The Pioneer Telephone Company, Pioneer, O.—to construct and operate a telephone system. Capital stock, \$3,000. Incorporators: L. A. Beard, C. A. Kerr, W. F. Kessler, H. G. Young, F. J. Hadley, M. T. Hodson, A. E. Quidort and J. P. Hannan.

The New Union Telephone Company—to operate between Glens Falls, South Glens Falls, Sandy Hill, Fort Edward and the adjacent towns and to Albany and Troy, N. Y. 'Capital stock, \$100,000. Incorporators: B. B. Fowler, L. M. Brown and Arnold Wurtenberg, Glens Falls.

The Lewisburg Telephone Company, Lewisburg, O.—to construct and operate telephone lines. Capital stock, \$1,500. Incorporators: W. G. Brown, E. C. Priddy, D. E. Horn, T. L. Gregg and P. L. Coleman.

The Summit Telephone Construction Company, Akron, O. Capital stock, \$5,000. Incorporators: W. A. Green, F. S. Foltz, B. W. Green, G. A. Shaffer and T. W. Wakeman.

The Cortlandt Home Telephone Company, Cortlandt, N. Y.—to operate in Cortlandt and Homer. Capital stock-\$7,300. Incorporators: Charles D. Ver Nooy, Willard H. Jones, George J. Hager, William Martin and Herbert L. Smith.

MULTIPLE SWITCHBOARD IN THE COPENHAGEN EXCHANGE—CAPACITY 10,000 SUBSCRIBERS.

relay. The multiple jacks are made very small, eight inches in length, in order not to have the operator reach too far. When the top hall is filled up, another exchange of the same size and capacity will be installed on the next floor. The cross connection board is made large enough to take 12,000 subscribers, and the cables from the outside are partly brought from the permanent derrick (or tower) and partly from the underground cables, all passing through carbon lightning arresters, and as at present Copenhagen has no trolley lines, it is, consequently, not yet necessary to have any fusible coil arrangement. Additions made in Copenhagen within the past years are 8,000, of which is a new switchboard of 7,400 capacity for public call-stations exclusively. In the mainland of Denmark all the telephone companies have amalgamated into one large concern, which, within a few years, in the large centers, has put in complete exchanges with the L. M. Ericsson & Co.'s "standard" type multiple board.

The Highland Telephone Company has bought an interest in the telephone exchange at Monroe, N. Y., and will extend the same to Chester, Washingtonville, Highland Mills, Cornwall and all intermediate points.

The Colorado Telephone Company, Pueblo, Col., has increased its capitalization from \$1,500,000 to \$8,000,000.

communication was had with Boston, New York, St. Louis, Cleveland, Milwaukee, Chicago, Detroit and other long distance points.

The New York Telephone, Telegraph & Cable Company, which recently acquired control of the independent telephone lines in Westchester County, has given a contract to A. S. Deveaugh, of New York to rebuild and repair the entire system at a cost of about \$30,000. The company will also build exchanges in Yonkers, White Plains and a number of other places where it has franchises, and expects to have 125 miles of wire in operation in the county by December 1.

Advices from Rochester, N. Y., state that the striking Bell Telephone Company linemen have succeeded in making a great deal of trouble for the company. The wires inside the city line have been carefully watched, but this has not prevented the strikers from cutting many of the long distance wires and otherwise hurting the long distance service.

The Missouri-Kansas Telephone Company is rushing the work on the line between Wichita and Kansas City.

Tha Cumberland Telegraph & Telephone Company has extended their line from Ortella to Archer, Tenn.

#### GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Algonac, Mich. This town will expend \$20,000 in

Arlington, N. J.—A new electric light and power company has been formed in Kearny with W. Hanna of East Newark as president. The capital stock is \$150,000. A large plant will be erected on the Kearny shore of the Passaic River, and it is the company's purpose to furnish electric light in Hudson and Essex Counties.

Ashland, Ore.—Improvements to the amount of \$4,000 are to be added to the electric light plant at this

Blair, Neb - This town is agitating the question of owning its electric light plant

Binghamton, N Y.—John J. Irving is considering a scheme to construct an electric plant to light the court house, county clerk's (flice, jail, and possibly the armory and county house.

Bonham, Tex.—A short time ago the two electric light plants of this city were consolidated and now the question of erecting a municipal electric light plant is under consideration.

Brooklyn, N. Y.—The electric light plant at Ridge-wood Park was recently destroyed by fire.

Clyde, Ill. - A recent fire and explosion wrecked the plant of the Electric House Lighting Company. Loss, \$17,000.

Conemaugh, Pa.—Bids will soon be advertised for the erection of a new electric lighting plant at this place, for which \$12.500 in bonds have been voted.

Dothen, Ala.—It is an assured fact that an up to-date electric light plant is to be installed here soon. The proposed plant is to cost between \$10,000 and \$12,000.

Ducktown. Tenn. - The electric light question is being discussed here.

Elbs, Wash.—An electric plant to cost between \$150,-000 and \$200,000 will be erected at the Naqually Falls near this place, providing Tacema will make a contract for lighting.

Florence, Ala.-E. A. Schubert has been granted a franchise to erect an electric light plant.

Greensboro, N. C. — The aldermen have granted a franchise to the Guilford Power Company for an electric lighting plant. The franchise must be accepted within 6) days, and the work of constructing the plant begun within 6) days thereafter, or it becomes void.

Lawrenceburg, Ind.—This city will receive propositions until August 1 for the construction of an electric light plant for lighting the streets of Lawrenceburg and the adjoining town of Greendale. Address Jos. F.

Marshalltown, Ia. — The board of supervisors has decided to install a complete electric system to light all county buildings.

Milwaukes, Wis —Plans are being considered for the es a bishment of an electric lighting plant in the Chamber of Commerce and Mitchell tuildings.

Newberry, Mich. — This village will issue bonds for an electric light plant and waterworks.

New Iberia, La.—T. W. Nicol of Mobile, Ala., has been engaged as consulting engineer for the proposed electric light plant here.

North Amberst, O. — The citizens are contemplating the construction of an electric light plant.

Ontario, Ore —The city council has granted the petition of Messrs. J. J. Cortright and L. Adams for a franchise to erect an electric light, power and heating plant.

Osgood, Ind. - James B. Nelson of Indianapolis has been preparing the plaus and specifications for an elec-tric light plant for this place.

Pittsburg, Pa.—The Eichbaum building, which was o cupied by the Holmes Electric Protective Company of this city, was recently destroyed by fire, entailing a

Port G been, Miss. — The election for the issuing of \$12,000 worth of bonds to improve the waterworks and electric light plant was held recently and was carried in favor of the issuance.

Richmond, Ky.—Pursuant to the decree of Circuit Judge Scott, advertusements have appeared announcing the sale on July 12 of the Richmond electric light plant, just erected in this city.

Ruston, La—This city is about to issue \$25,000 in bonds for the construction of an electric light plant.

Siginaw, Mich —The citizens are agitating the ques-in of erecting an electric light plant to be owned by the city.

South Haven, Mich. — At a recent election held here it was voted to bond the town for \$10,000 to complete t ie electric light plant.

St. Louis, Mo — A reso'ution was recently adopted instructing the board of public improvements to furnish an estimate of the cost of putting in an electric light plant in the new city hall for turnishing light to the city institution. the city institutions.

Swampscott, Mass. — This town is making arrangements to secure its own electric lighting plant

Toronto, Can.—Tenders will be received until July 3 for a complete electric light plant for the village of E at Toronto. Address H. F. Strickland, engineer, East Toronto.

Two Harbors, Minn.—At a recent election it was voted to issue bonds for the purpose of enlarging the electric light plant. About \$20,000 will be expended on the improvements.

Wabash, Ind.—The First National Bank of New York City has purchased the Wabash electric light plant here and will operate it incorjunction with the Wabash waterworks which the bank owns. The capacity it is stated, will be doubled.

Walla Walla. Wash —This town is agitating the question of building an electric light plant.

Warrenton, Ga. — This town desires estimates on an electric light plant of 12 arc and 300 to 500 incandescent lights. Address B L. Battle.

Waynesboro, Va — The Waynesboro Electric Light Company will enlarge its plant.

Waynesville, O -The question of erecting an electric light plant here is being considered by the citizens

Webb City, Mo. — An ordinance has been adopted providing for the issuance of \$20,000 in bonds for erecting an electric light plant.

#### STREET RAILWAYS

Bristol, Pa.—Hugh B Eastburn, of Doylestown, was recently here in the interest of the New Jersey Trolley Company which desires to extend its line through this place to Emilie and Fallsington to Trenton.

Bronxville, N. Y.—The New York, Westches'er & Connecticut Traction Company, owned ly the P. H. Flynu syndicate of Brooklyn, has secured a franchise in this village that gives it the right to complete and operate a line over the White P ains road, connecting the proposed Tuckahoe line with the North Mt. Vernon electric road, which is now owned and operated by the syndicate

Columbus, O—The Urbana, Mechanicsburg & Columbus Electric Railway Company was lately granted a franchise in Franklin County by the commissioners. The company is to beg n work on the road October 1.

Edwardsburg, Mich.—A report is current here that there is strong probability of an electric railway being built from South Bend, Ind., to D. amond Lake, via this place and Esgle Lake.

Elwardsville, Ill.-The St Louis & Illinois Electric Railroad Company has been incorporated to build an electric street railway from East St. Louis to this place. F. Vorwald, C. N. Travous and W. M. Watnock are all interested.

Find ay, O.—A contract was recently entered into by Theodore Wentz, president of the Findlay, Fostoria & Toledo E ectric Bailroad, for the construction of the road between this point and Fostoria by October 1.

rosu between this point and rostoris by October I.

Ionis, Mich.—The common council will at its next
meeting be asked for a franchise for an electric railway
through this city. F. H. Taylor of Detroit, says work
will soon be commenced on an electric road along the
river road out to Saranac. Lowell, Ada and Grand
Rapids. It will cost \$500,000.

La Porte, Ind.-The La Porte & Michigan City Railway Company was recently incorporated with \$300,000 capital stock with headquarters in the city. J. A. Brett, of Chicago, is presuent of the company, which will operate an electric railway between here and Michigan City, a distance of about 14 miles.

Leechburg, Pa.—The village council has granted the right of way through this town to the Apoilo Vandergrift & Leechburg Electric Bailway Company, and the work of constituting the line will soon begin.

Marysville, ()—The Union Coun'y commissioners have granted a franchise to Judge John 8 Gill of Columbus for the turpose of building the Columbus, Dublin, Plain City, Mechanicsburg and Urbana electric line through here.

Napoleon, O—Cleveland capitalis's headed by ex-Mayor McKisson have been in this county promoting an electric railroad from Fremont to D flance touching

Bowling Green and this p ace on the way.

New York City.—It is stated that the American
Railway Company, of No. 6 Wall street, proposes to
build an electric road and make trips from this city to
Chicago by means of cigar-shaped cars in five hours.

The cars are to lun on a single rail.

Niagara Falls, N Y.—The Niagara Falls Street Railroad Company proposes to build a crosstown electric line. Construction will begin as soon as permission is granted by the railroad committee.

Pompei, Mich. - The electric road is a certainty for

Portsmouth, O-Parties from Huntington, Virgina., have recently been negotiating for terminal facilities at this place for an electric freight and passenger road from Ironton, running through Hanging Book, Franklin Furnace, Wheelersburg and Scioto-

Redding. Cal.—The McCloud River E'ectrical Power Company was lately granted a franchise by Shasta County supervisors. The company will operate an electric railroad between here and Copper City a distance of 30 miles. The route is via Keswick, Copley and Kennett to the Delamar copper mines.

San Bernardino, Cal.—J. L. Campbell is interested in a proposed electric railway for the place.

Sauquoit, N. Y.—Talk of building an electric road from Utics to this place via Willowvale is being revived. It is now stated that New York capitalists are interested and that the road will go through.

Slatington, Pa.—The Slatedale S:reet Railway Company has been chartered to operate a trolley street railway between here and Slatedale, Lehigh County. The length of the road is about four miles. Those interested are Francis J. Crilly, John L. Schwartz, Patrick F. Cannon, Francis A. Kreitz and Walter J. Sager, all of Allentown, Pa.

Ware, Mass.—The selectmen recently voted to grant a location to the Worcester & Hampshire Street Railroad Company for a trolley line which will go to Gilbertsville and West Brookfield, and connect there with the line to North Brookfield.

Weyauwegs, Wis.—The Hutchirson Electric Rail-way Company is a new corporation here, and contem-plates the construction of an electric line from New London to Berlin touching Royalton and this city.

Wheeling, W. Va.—The Ohio Valley E'ectric Com-pany has been organized to build a trolley road from this city to Wellsburg.

Woodmont, Conn — Express trolley cars for the benefit of the people of this place will be put in service July 1, and will make the run to Bridgeport in fity minutes.

#### MANUFACTURING.

B. ston, Mass. — The Choralcelo Manufacturing Company of this city was recently organized to manufacture and deal in electrical musical instruments on a capital of \$3,000,000. Among these interested in the concern are E M Crosby, W. L Flint, G. S. Heath, G. B. Sinclair, A. B Upham, all of Wakefield, Mass.

Jersey City, N. J.—A new concern, capitalised at \$3 000,000 and known as the Varley Duplex Magnet Company, will manufacture and deal in magnets, duplex electric motors, etc. Its principal effice is to be in

Trenton. N J.—The Pyro-Electric Company, with a capital of \$500,000, has lately been formed to manufacture electric machinery. The incorporators are W. E. Gilmore of O anne; E. L. Brown, G. G. Kolff, both of New York; H. Buil, attorney, of New York City.

#### COMPANY MATTERS.

Albany, N. Y.—At a recent meeting of the stock-holders of the United Traction Company held in this city the following directors were elected: Robert C. Pluyn, Francis N. Mann, Jr., Anthony N. Brady, William Kemp, A. Beecker Banks, Charles Cleminshaw, John G Myers, Edward Murphy, Jr., Simon W. Roseadale, William Shaw, John W. McNamara, James O'Neil, James H. Manning, William J. Walker and George P. Ida.

Manning, S. C.—F. P. Ervin has been elected manager of the Cotton Seed Oil Mill and Electric Illuminating Company, recently formed here with a capital of

\$3),000.

New York City. — The Western Electric Company of 463 West street will spend \$20,000 in alterations to the building at No. 149 Bank street. The company will use the building as part of its plant.

Portsmouth, N. H.—The annual meeting of the stockholders of the Portsmouth, Kittery & York Electric Street Railway Company was held this month. The following were elected directors: E. Burton Hart, Jr., and Theodore L. Peters of New York; F.E. Bowell, Horsce Mit hell and W. G. Meloon of Kittery; N. M. Walker of York, and M. I. Masson of Brunswick.

St. Elmo. Tann. — The Chattanoges Medicine Com-

St. Elmo, Tenn. — The Chattanooga Medicine Company has decided to dispense with steam power and operate its plant located here, by electricity.

#### POWER AND TRANSMISSION PLANTS.

Port Arthur, Can —An electric power plant to generate 6 10,000 horse power is to be erected to utilize the falls of the Kaministiqua River near this place and Port Williams. It is proposed to invest \$5,000,000 in the works.

York Haven, Pa .- Work will be commenced next month on the construction of a power plant on the Susquehanna River at this place. Engineers have estimated the cost of the work at from \$2,500,000 to \$5,000,000. The plant will be developed by the York Haven Power & Water Company.

#### AUTOMOBILES.

Newport, R. I. — The New England Electric Vehicle and Transportation Company arrived here a few months ago, and has been constantly enlarging its plants, having invested nearly \$200,000 in its business until now there are in the station nearly 100 automobile vehicles of different patterns, and many more will be added before the season closes.

St. Louis, Mo — Last week President Mahon left for Chicago. Detroit and Cleveland for the purpose of shipping to this city 450 regulation 'buses which the union his secured and to negotiate with the manufacturer in Cleveland, O, for the purchase of automobiles for use in the boycott against the Transit Company.

#### LECTRICA SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

#### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16; @16;c.; Lake, 16; @16; z.; casting, 16@16lc.

The Adventure Consolidated Copper Company has called an assessment of \$3 per share, payable in three equal installments.

The first semi-annual dividend of 3½ per cent. was recently declared on Easton (Pa.) Consolidated Electric stock, payable Ju'y 23.

The directors of the Amilgamated Copper Company have declared the regular quarterly dividend of 1½ per cent. and ½ per cent. extra.

The directors of the Thirteenth and Fifteenth Streets Passenger Railway Company of Philadelphia have declared a dividend of 86 per share, payable July 2.

The directors of the New England Electric Power Company have declared a regular semi-annual dividend of 3 per cent., payable July 16 to stock of record May gross earnings of the Pattsburg United Traction Company were \$169,278.

compared with \$15),448 the same month last year; net earnings, \$77,014, against \$83,(28 in 1899.

The Metropolitan Street Railway (New York) directors have declared the regular quarterly dividend of 12 per cent., payable July 16; books closed June 26 and reopen July 17.

The directors of the Cincinnati Street Railway have recommended an increase the capital stock from \$18,000,000 to \$23,000,000. Stockholders will vote upon the increase July 25.

The Boston Electric Light Company has declared a regular quarterly dividend of \$2 per share, pavable July 14 to stockholders of record June 3). Books close June 3) and reopen July 16.

Advices from St. Louis state that the St. Louis Transit Company will continue dividends in spite of the strike. The Uaton Railways Company will pay its regular quarterly dividend of 14 per cent. on July 10.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 13 a,15; New York Electric Vehicle Transportation, 6(66); New England Transportation, 34(6)37; Gramophone, 35(6)40.

The directors of the Central and South American Telegraph Company have declared the regular quarterly dividend of 1½ per cent, payable July 2 to stock of record June 25. Transfer books closed June 25 and reopened July 3.

The directors of the Eric Telegraph & Telephone Company have declared dividend No. 67, 1½ per cent., payable July 9, 1990, to stock of record June 30. The stock books will be closed from Saturday, June 33, to Monday, July 9, 1930.

The reorgan zation committee of the General Electric Autombile Company advises stockholders that unless 25,000 shares have been deposited on a certain day sale of the property will be made without regard to their (the stockholders') interests.

President Vreeland, of the Third Avenue Bailroad Company, filed a receip on June 20, in the U.S. Circuit Court for \$154,994 and two advertising claims aggregating \$4,390, thereby relieving Hugh J. Grant from the receivership of the com-

The New York, Westchester & Connecticut Traction Company, owned by the P. H. Flynn syndicate, of Brooklyn, has, after a long fight, secured its franchise in the village of Bronxville. The granting of this franchise gives the Traction Company a right of way to the town line of White Plains.

President Vreeland, of the Metropolitan Street Bailway Company states that on account of an iron-clad agreement between the Third Avenue and the Manhattan no transfers can be exchanged between the Third Avenue lines and others in the Metropolitan system for four years.

The American Telephone & Telegraph Company has declared a regular quarterly dividend of 1½ per cent, and an extra dividend of ½ per cent, payable July 16 to stock of record of June 3). Boks will be closed from July 2 to 14 inclusive. This is the first dividend for the stock since the absorption of the American Bell Telephone

A mortgage for \$500,000, te run forty years, given to the Morton Trust Company of New York, by the Plainfield G is and Electric Light Company, has been recorded in Elizabeth, N. J. The mortgage is given to cover the issue of 500 bonds of the denomination of \$1.000 each, payable in gold coin and bearing 5 per cent. interest, payable semi-annually. payable semi-annually.

The stockholders of the Consolidated Traction Company of Pittsburg, Pa., voted almost unanimously last week to lease the road to the Union Traction Company. It was charged at the meeting that the dividends paid were in excess of earnings by \$805 664. The excess was covered by a donation of 28,500 shares of common stock by the syndicate which controls the property.

The Baltimore County Water & Electric Company has recorded a 49-year 5 per cent. gold bond mortgage for \$1,000,000 to the Maryland Trust Company, tsustee. The company was formed to furnish electric current for lighting, heating and power for commercial and railway purposes in Baltimore County, and to supply water to Canton, Highlandtown and Catonsville, Md.

The Illinois Electric Vehicle Transportation Company is sending stockholders formal notice of special meeting of April 5 reducing the capital from \$25,000,000 (250,000 shares par \$100) to \$2,500,000 (250,000 shares \$10 par.) The stock is now \$5 paid and the balance of \$5 may be called in installments of \$1 per share or less at periods intervening of not less than 90 days each. The call for assessment Ju'y 1 has been withdrawn.

The Binghamton General Electric Company of Binghamton, N. Y., largely owned in Boston, has declared its regular semi-annual dividend of 2 per cent. payable July 2. The company is said to have been earning at the rate of about 6½ per cent on its \$28),000 share capital, above fixed charges. It is an electric lighting company also furnishing power for mercantile purposes. It is now adding new buildings and equipment to its plant at a cost of \$40,000 to be paid for out of surit 6½ per lighting plus earnings.

A circular has been issued by the General Electric Company announcing a special meeting of stockho'ders at Schenectady on July 17 to authorize the issue of \$4 415,000 of new common stock to redeem outstanding bonds at the rate of \$100 of par value of stock for every \$120 of par value of bonds. This is in conformity with the terms at issue of \$10,000,000 of 5 per cent. gold debenture bonds made in June, 1892, which were to be exchanged for non assessable full paid common stock at the discretion of the company. Of this amount there has already been canceled \$4,700,000 of bonds. Howing ettil outstanding \$2,900,000. 702,000 of bonds, leaving still outstanding \$5,298,000.

The stock holders of the Electric Vehicle Company at a special meeting held recently in Jersey City unanimously approved the recommendation of the board of directors that the capital stock of the company be increased from \$12,000,000 to \$18,000,000. The additional \$6,000,000, which is to be half common stock and half preferred, is to be issued for the purpose of taking over the Columbia Electric Vehicle Company, of Hartford, and the New Haven Carriage Company, which is controlled by the Columbia. The Electric Vehicle Company already owns one-half of the stock of the Columbia Electric Vehicle Company.

#### EDITORIAL NOTES.

The Summer Convention of the Northwestern E!ectrical Association.

The summer meeting of the Northwestern Electrical Association, the proceedings of which will be found elsewhere in this

issue, was not only of considerable importance from an engineering and technical standpoint, but proved a most enjoyable outing for those who were fortunate enough to be present. Probably no more charming spot than Waupaca could have been selected for the gathering, owing to the picturesqueness of the locality and the innumerable opportunities afforded the visitors for enjoyment.

As will be seen by a glance at the proceedings a number of instructive papers were presented which dealt with topics of interest to the electrical fraternity. It was to be regretted that Mr. Wait's paper on "Street Lighting" was not read, as it would undoubtedly have elicited an interesting discussion, as was the case with several of the other papers. The members, however, will not be deprived of the benefits of the paper itself as it will appear later in the proceedings of the Association.

The attendance was fairly large, there being some eighty delegates and visitors present, while the social and entertainment features were everything that could be desired, thanks to the efforts of the gentlemen having these matters in charge.

\* \* \*

A Municipal Ownership Experiment. Persons of socialistic tendency, who advocate municipal or governmental ownership, are still being heard from. Some want

the Government to obtain control of the various telegraph companies and operate them in conjunction with the postal system. Others in various localities are begging the local municipal government to construct and operate a telephone system—as is the case in Detroit—or to purchase the street railways, and operate them à la Glasgow. Incidentally, so far as New York City is concerned, the American Ice Company might almost be said to be a municipal enterprise. But to return to our muttons. The argument invariably advanced by municipal ownership enthusiasts is, that the enterprise whatever it may happen to be, could be

run so much better and more economically. In support of this, England, France or some other foreign country is pointed to. But if it comes to pointing, why not point to Boston, which happens to be an American settlement not so far away. Regarding the municipal ownership experiment, which was made during the administration of Mayor Quincy, a recent issue of "Harper's Weekly" has this to say:

"During the administration of Mayor Josiah Quincy, it was announced that he entered upon . a policy that would save the taxpayers of Boston thousands of dollars. Having become convinced of the wisdom of municipal ownership, the panacea of the socialists for most of the evils of the body politic, he proposed to cut off the individual and corporate leeches that supplied the city with various commodities. With this beneficent end in view, he had a municipal ice-plant and a municipal printing office established. For the care of the city's horses, a veterinary bureau was added to the municipal departments. For other work wheelwrights, blacksmiths, carpenters, painters, letterers and a whole army of other employes were hired.

"But in less than two years, the attractive theory upon which this change was based has been completely discredited. Instead of saving the city thousands of dollars, the new departments and bureaus have added thousands of dollars to the city's Indebtedness. Mayor Hart took office, he was called upon to sign vouchers for work that appeared to him to be needlessly expensive. Upon investigation he found that the city was paying for labor and materials far more than the current rates. For example, he found that the electrical equipment of a ferry-boat operated by the city, which should have cost only \$6,800, had cost \$10,200. The electrical work on a city building for nurses, which should have cost \$1,528, had cost \$4,754. For work on a city armory, which should have cost \$2,600 the city had to pay \$6,700.''

After citing numerous other cases of exorbitant charges, such as the above and that ice rose from \$3 to \$6 a ton, the article continues:

"If any one supposes that the increased cost of those new bureaus and departments was due to dishonesty in the ordinary sense of the word, we hasten to correct the error. It was due simply to the extravagence and inefficiency that appear to be inseparable from the municipal management of business matters. The new bureaus and departments were loaded

down with political appointees. In order to get money enough from the common council to carry on their work the chiefs had to appoint such men as the aldermen demanded. A striking example of the kind of pressure to which they were subjected comes from the printing office. When a notoriously unsatisfactory employe was dismissed he went to the alderman in his ward, and after an interview with him returned to the office and said: "Alderman Blank of South Boston says I'm to go back to work; but if you make any kick about it, I'm to have your place, and you go. See?" The superintendent of the office did see, and reinstated the worthless fellow. But what was true in this instance has proved true in numberless other instances. It is estimated that the removals that Mayor Hart has already made have saved the city from \$500,000 to \$600,-

The writer of the article in question goes on to state that civil service reform was no cure for this evil, owing to the many ways an in-·fluential politician can get a person appointed without its being necessary to undergo the ordeal of an examination. The article then concludes as follows:

"Of course the defenders of municipal ownership will say that under different conditions the result would have been different. But as human nature is virtually the same the world over, we may conclude that the same outcome would follow the same experiment in any other city in the United States."

This fiasco in Boston should furnish advocates of municipal ownership with food for thought. Unfortunately, a large majority of those who cry the loudest for the Government and municipalities to take over street railways, lighting plants and telephone exchanges, are not of the kind that are much given to deep meditation.

Fair Protection of Trade and Commerce many rabid measures Against Unfair Monopolies.

After taking time to reflect over the very that were introduced in Congress during the session recently

closed against trusts, monopolies, combinations in trade, etc., it is well to stop and consider just what steps could and should be taken to protect the public from all restraints and monopolies that may be unlawful, without detriment to trade as a whole.

It would seem in the first place, as though the most important legislative step should be directed against the cause of these evils in business, and not at business itself. For instance, when a bill is introduced which seeks to declare illegal any association or corporation engaged in production and the carrying on of any business for the purpose of controlling or monopolizing the manufacture or production of any article of commerce, as was the case during the session just ended, it goes a step too far, in that the prohibition would cover not only the unfair monopoly and unfair control that is obtained by unfair means, but also the fair control which any manufacturer, miner, or other producer may seek fairly, and perhaps obtain, by means of new machinery, processes or inventions; by his own trade secrets, or by ownership of natural facilities such as mines and water powers, or by any other conditions which may give him success in his particular business and also a practical control of the article that he produces.

To be reasonable and fair it would seem that

the prohibition as to production should be limited either to monopolies obtained by unfair means, or that it should be directed to unfair methods of sale, trade, transportation and commerce, by which it is claimed that certain unfair monopolies have been fostered and maintained. Claims are made, and in part substantiated, that special rates, special freight rates, special privileges as to cars, storage, switching, telegraphing, and prompt delivery of goods have been obtained by certain monopolies, without which they would not have been able to secure a permanent foothold, and by so doing crowd out competition.

All of these matters are clearly within the limits of the interstate commerce jurisdiction of the United States, and if that jurisdiction is not equipped with sufficient legislative power to cope with the situation as it exists, then the proper step would seem to be to have that legislative power extended in order that it may be in position to meet any emergency. and such a measure should receive concerted action by merchants and manufacturers during the interval between the sessions of Congress, so that when that body convenes again. it would be in a position to introduce a bill that would be liberal in its ideas, and yet comprehensive enough to cover the existing evils.

It would seem that much could be done in this direction by giving absolute publicity to all transportation contracts, liberal provisions for civil actions for the recovery of unlawful rebates, and suitable penalties from those who have obtained the benefit therefrom.

The measure thus to be introduced would be considered as too important to contain any provision that would attack any of the great productive energies of the country, but it should be framed so that it would seek to prohibit unfair business methods of sale, transportation and commerce, such as are well-known to be at the disposal of some producers to-day. should contain provisions that will meet the evils, the boycotting of rivals or of those who deal with rivals, the rebates by common carriers, special privileges and rates, and it should make it obligatory that there should be a necessary degree of publicity of the business of common carriers as will enable these evils to be detected, and allow each man who is injured to obtain full protection and redress in the courts

Such a measure can be framed; such a measure should be framed by those interested; and if it is framed and introduced at the next session of Congress it is fair to assume that it would receive the sanction and support of a sufficient number of the members of both branches of the legislative assembly to become a law, and thus secure the object hoped for; and this will never be the case with extreme measures such as have been introduced during the session just ended.

The transformation of the street railways of the country from horse power to electricity has been the work of scarcely a decade. The close of 1899 found in this country 871 roads with upwards of 19,000 miles, of which less than 500 miles were of the old-fashioned system. New England has reduced her mileage of horse railways to only eight miles. The total mileage of street and elevated railways at the close of 1899 was 19,213 miles; number of cars, 58,736. Capital stock, \$1,023,819,978; funded debt, \$777,-862,571: total, \$1,801,682,558. The increase of liabilities of 1899 over 1898 was \$198,682,899 for

b)th capital stock and debt, indicating a year of activity. New England's share in the above was 2,997 miles of railway, 10,652 cars, with capital stock and debt of \$123,673,000. Massachusetts occupies the commanding position in New England with 1,625 miles of railway, Connecticut has 492 miles, Maine 279 miles, Rhode Island 181 miles, Vermont 71 miles, and New Hampshire only 57.

#### UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

JOHN M. ROACH, president of the Union Traction Company of Chicago, has outlined to the street railway commission a plan for a gigantic subway to relieve street traffic in that city. Many millions of dollars will be necessary for the completion of the project. The plan involves an equal sharing of the expense by the two traction companies operating surface trains into the heart of the city.

THE latest application of electricity for use aboard ship is a patent inclinometer, designed to register the exact roll or list to port or starboard of a vessel at sea or in harbor. It is claimed that this instrument is extremely sensitive and absolutely unerring in its indica-

WE are in receipt of an attractive Fourth of July souvenir from the American Electrical Works, Providence, R. I. On the front cover is shown a very small boy, lighting a very large fire-cracker, accompanied by the appropriate inscription, "When things happen." On the third page appears the dome of the capitol with a flag-staff near it emerging from a thick grove. The latter serves to hide "old glory," which may be run up to the top of the staff by the simple process of tightening a string which passes through an eyelet at the top of the pole, and emerges at the back of the souvenir. In the sky the following command appears: "Run up 'Old Glory 'at 12.01 A.M., and don't take it down till 11.59 p.m., and make things hum all the time."

In a paper read before the British Dental Association recently, Mr. T. S. Carter described an electrical motor for drilling holes in the jawbones in order that wires may be used to keep a fracture in place. The motors could be constructed for use either with continuous or alternating current. He then described various operations for fractured jawbones in which the motor had been used, and stated that he considered that it might be used with very great advantage in trephining and other operations now done by hand.

News from Athens, Ga., states that the 1,000 horse-power electric plant at Tallahasse: Shoals will be completed in a short while. The power-house will be sold as soon as finished, and it is rumored that a large cotton mill will be erected there.

In a report recently forwarded to the State Department at Washington in regard to the use of electric power in Greece, United States Consul McGinley at Athens says: "From reliable sources, I have learned that the Athens & Piraeus Railway Company must, according to conditions in its franchise, adopt electricity as the motive power for its trains within the next

three years. This road extends from the quay in Piraeus to the business center of Athens, some five miles, three-fourths of a mile of the distance being through a tunnel under a portion of the city. A Belgian company which owns and operates a steam tramway between Athens and Piraeus, via Phaleron, also wishes to adopt electric power for its trains, but how soon it desires to make the change has not been learned. Each road has a very large passenger traffic, especially in the summer. A company of Athens has been trying to secure the contracts for fitting these roads with electric power. I have been informed that the president of the first-named company has gone to the Exposition at Paris to examine the electric contrivances on exhibition there, and to endeavor to secure the best possible equipment for his road,"

THE Magellan Straits will be connected by wireless telegraphy with the rest of the Chilian Republic.

It is stated that an electric locomotive in a Canadian coal mine, shows a saving over mules of \$2,528 in 200 days, and an electric pump in the same mine shows a saving over steam pumps of \$1,573 in 970 days.

GENERAL GREELY has been informed that the Signal Corps wireless telegraphy stations have been established and are in successful operation between Alcatraz Island, San Francisco Harbor and Fort Mason. It has been impossible to maintain cable communication between these points, owing to interruptions by shipping, incoming vessels dragging their anchors and injuring and misplacing the cables continually. This is the first system of wireless telegraphy established as a practical working system where other means have failed.

THE immense airship, built on the Lake of Constance, near Friedrichshäfen in Germany, and which was referred to in the issue of Electricity of November 15, 1899, has been completed, and was given a trial a few days ago. It traveled with five persons from Friedrichshäfen to Immenstadt, a distance of about fif teen miles.

A DISPATCH from Washington states that Supervising Inspector General Dumont has decided that automobiles operated by gasoline engines cannot be carried by freight or passenger steamships. This decision was made upon inquiry by the Jamestown & Newport Ferry Company. Mr. Dumont decides that section 4,472 of the Revised Statutes absolutely prohibits the ferriage of naphtha, benzine, etc., under any circumstances, on either freight or passenger steamships, which includes ferryboats, and therefore would prohibit gasoline automobiles when their tanks are supplied with gasoline.

A TELEPHONE system is in operation in Egypt, with headquarters at Cairo, and branches at Alexandria, Port Said, and other towns, says the London "Electrical Engineer." The company has a trunk line running from Cairo to within a few miles of Alexandria, but has been unable to complete it on account of Government opposition, which is based on the ground that the telephone line would diminish the State receipts from the telegraph system. The telephone company employs male operators only, and these are required to be expert

linguists, having to speak English, French, Italian, modern Greek, and Arabic. There is also in Cairo an electric lighting central station supplying the very respectable output of 35,000 10-cp. lamps. Brown-Boveri alternators, giving 2,000 volts at 40 cycles, are direct driven by Sulzer engines, and the distribution is through concentric cables. There are 90 transformer sub-stations, at which the current is stepped down from 2,000 to 100 volts.

The newest and most important underground electrical railroad, running from the Bank of England to the Western suburbs, beneath the central portion of London, was opened by the Prince of Wales on the afternoon of the 27th ult. in the presence of a distinguished gathering. The Prince greatly admired the handsome American cars, similar to those in use on the New York elevated railroads.

Information from Washington, D. C., states that Major G. W. S. Stevens, in command of the new signal corps post, is now experimenting with several automobiles with a view of establishing their practicability as balloon wagons and as substitutes for the other wheeled craft of his aeronaut division. Our adoption of an automobile balloon train would mark a distinct epoch in military aeronautics. The multiplicity of storage batteries on horseless wagons would supply ample electricity for balloon telegraphy and telephony.

THE British Administration advises that the Western Union telegraphic code and international cable directory (Universal Edition), 1900, having been deposited at Aden by the Japanese Government, and chosen by the Canadian and United States Governments, may now be generally used for telegrams to and from Zanzibar, Seychelles, Mauritius, Madagascar, British and German East Africa, Mozambique and Laurenzo Marques.

An electrical process for smelting iron ore has had a trial on an extended scale in Italy, no less than \$180,000 having been invested in a plant for the manufacture of 4,000 tons of iron a year. The works are at Camonica, in the north of Italy, where water power is very cheap, an electrical horse-power for a year, or 8,760 working hours, costing only about \$10.50 to generate. The iron ore is ground to a fine powder and intimately mixed with ground coke and limestone. The mixture is ground into small briquettes with a suitable binding material, such as tar, and heated by the electric current in suitably designed furnaces. A continuous output results, the slag and iron being drawn off from time to time. As compared with the old process, wherein the heat is supplied by burning coke in a blast furnace, the cost is reduced nearly \$12 a ton for the finished product, which is a high carbon manganese steel of great purity. Of course the figures given are based on the cost of coke, etc., in Italy. They would be much less in this

Growing interest in automobiles has led to close rivalry and great perfection in the construction of automobiles in France. This is true of all forms of automobiles, but particularly so of those using electric power. At present both the long distance and high speed records for electric automobiles are held by members of the Automobile Club de France. M. Krieger has covered 152 kilometers (94)

miles) on ordinary roads without recharging the batteries of his machine, the run being at an average speed of ten miles an hour. The high-speed record belongs to M. Jenatzy, who made a kilometer from a standing start in 47.3-5 seconds, and with a running start, in 34 seconds—a speed of sixty-five miles an hour.

A Portuguese paper gives details of an invention which is to greatly facilitate fox and badger hunting. The device consists of a small electric lamp fixed on to the collar of the dog who is to enter a burrow. The effect of this light, which is to be colored, is expected to have the effect of frightening the animal, which is used to living in a dark hole. It then tries to escape out of the burrow and the hunter bags him.

Officials of the Evanston Electric Street Railway of Chicago have decided upon the cause of the derailment of their cars of late. Bugs, they assert, are responsible for the accidents. Within the last few days several cars on that line have jumped the track. In each case it was in the immediate vicinity of an arc light. The derailment, it is claimed, was caused by hundreds of carcasses of bugs which have fallen dead on the tracks, after hovering about the arc light. This discovery was made by an employe of the road who has had experience with grasshoppers in Kansas.

# The Northwestern Electrical Association Summer Convention.

The delegates to the Northwestern Electrical Association Summer Convention began to gather at the Grand View Hotel, "Chain o' Lakes," Waupaca, Wis., on Monday afternoon and Tuesday morning, June 25-26, so that when President Norcross called the meeting to order at 11 A.M., June 26, a very respectable number of delegates were in attendance. The President then delivered the following address:

Ladies and Gentlemen-It was at our last annual Convention that the voice of our Lord persuaded us to build our summer tabernacle on the banks of the clear lakes and flowing streams near Waupaca. The eloquence of that persuasive voice still rings in our ears. We have eagerly looked forward to the day when we should be made to lie down in the green pastures, and be led beside the still waters of that fair Beulah Land so vividly described upon that occasion. The Lord's promise and our firm faith in its fulfillment have made the intervening days seem shorter and brighter. We are here. Nothing that was told to us compares with the beautiful reality. The lakes are clearer and more numerous than we imagined, the air is laden with the spicy perfume of wild flowers, the charming seclusion of "deep-tangled wild-wood" which we find on the lake banks, exceeds the picture which was presented to our admiring gaze at the Pfister Hotel. We have wandered over the hills and through the dales, and have been fascinated by the varied scenery, we have breathed the pure atmosphere, have quenched our thirst from the clear water of these gem-like lakes, until we are renewed by the zeal, vigor and spirit of eternal youth. I have no doubt but that the Indian brave wooed his dusky bride in the sweet, leafy retreats about these lovely akes, and I am equally certain that his im-

perial successor, the white man, in these same cool, shady, enticing bowers, has found courage to woo and win a fairer, sweeter maiden. (Applause.) It seems to me that the god of day wears a brighter smile of gladness as he brings a fresh morning to this enchanted valley, and I can easily believe that his departure over these western hills is accompanied by a benediction and a promise. Standing in the presence of so many beautiful and wonderful objects of nature's handiwork, we may truthfully unite with the poet in saying:

"Know ye the land of the cedar and vine,
Where the flowers ever blossom, the beams ever shine.
Where the tints of the earth and the hues of the sky,
In color though varied, in beauty may vie."

We are glad to be here. We are thankful for the opportunity to shake hands with the enterprising men who have discovered for us this charming spot of nature's grand domain. Wisconsin is justly famous for its beautiful summer resorts, but among all its beautiful places there is none fairer or better than the Chain of Lakes about Waupaca. (Applause.)

Mr. Gerhard M. Dahl, City Attorney of Waupaca, then delivered the address of welcome, as follows:

Ladies and Gentlemen-It would be a superfluous task for me to express to you the gratification which it affords me to come here to-day and greet you on behalf of this community. Press of work prevents the chief official of the city of Waupaca from appearing here in person, and consequently this pleasant task has been delegated to me. I am not going to detain you for a long time and am not going to make a speech. I simply wish, in behalf of the city and county of Waupaca, to greet you and to bid you welcome to this place. I know that you are going to have a good time-I can tell it from looking at you. In fact, while sitting on the porch a short while ago, I heard a lady remark, "I never saw such a jolly lot of men in all my life." I never saw so many fat men in all my life. (Laughter and applause). I do not know whether it is because of the peculiar connection which you have with electricity, or not, but whatever it may be, such appears to be the case. This souvenir emblem which you all wear to day is symbolical of the first dim breathings of electrical progress. When Benjamin Franklin experimented with the key he had but a very slight idea, I take it, of the wonderful strides which would be made in electrical progress within the next century. To you men who are daily engaged in electrical matters, I believe the wonderful strides do not appear so appalling as they do to us laymen. I will not undertake to describe any of these remarkable improvements which have been made. O course you are all more familiar with them than I am-in fact, I do not believe that I would know the difference between a Phoenix generator and a motor armature. Nevertheless we laymen take a great deal of interest in this work which you are doing. You men are now here together in convention assembled to discuss principles and questions which are pertinent to your work. You are peculiarly engaged in enterprises which are, if not entirely public, are quasi-public, because the public at large are interested in the particular matters which you discuss, such as electric railways, electric lighting, etc., because on their work to a large extent depends the comfort, welfare and interest of the public. Gentlemen, you have come to these beautiful Waupaca lakes to hold your Convention, and we greet you. We are glad

that you are here, and we welcome you in the name of allthe people of this county. We give you the freedom of the city and the county, and the key, do with it what you will. You have come and we are yours. (Great applause).

The President—Mr. City Attorney, on behalf of the ladies and of the gentlemen who compose the Northwestern Electrical Association in convention assembled, we thank you cordially for your welcome.

The journal of proceedings of the Eighth Annual Convention of the Association held at Milwaukee, Wis., January 17, 18 and 19, 1900, was duly adopted as the minutes of that Convention, and the reading of the minutes dispensed with

The President appointed as membership committee, Mr. F. A. Copeland of La Crosse, Mr. W. Worth Bean of St. Joseph, Mich., and Mr. E. L. Debell of Sheboygan, Wis.

The report of the Legislative Committee was deferred until later during the Convention.

The report of the Committee on Investigation of Correspondence Schools, was deferred until the next Convention.

The Secretary then made a report on behalf of the badge committee. He stated that a silver button badge had been selected, which could be obtained for 75 cents each.

Mr. Lord — The Waupaca Convention Committee has nothing to report further than what you see. The members present can make their own reports and I will take up no more of your time. The report made by Mr. Lord, as an evidence of appreciation of the work done by him and his committee, was unanimously adopted by a rising vote.

The Secretary—The minstrel performance will be given at the Waupaca Opera House to-morrow (Wednesday) evening at 7:30, and the ball will be held here in the Convention Hall Thursday evening. I wish to say that the greater part of the expense for our entertainment has been borne by the Chicago associate members. I think it is proper and just to state that here. (Applause.) We have also arranged for the services of the Waupaca Veterans' Home Band.

The meeting then adjourned.

Tuesday—Afternoon Session.

The Convention was called to order at 2 P.M. by the President.

A number of applications for membership were reported favorably by the Membership Committee, and the applicants duly elected members of the Association.

Mr. W. Worth Bean, of St. Joseph, Mich., then read a short paper entitled "Advantages of Recording Watt Meters on Switchboards," which elicited a lengthy discussion, in which Messrs. Baker, Copeland, Ferguson, Grover and others took part.

The next paper, "Wet Steam," was read by Mr. William H. Edgar. This was followed by an interesting discussion in which Messrs. Schott, Copeland and McMaster took part.

A vote of thanks was unanimously tendered to Mr. Bean and Mr. Edgar for their able, interesting and instructive addresses.

The meeting then adjourned.

WEDNESDAY-MORNING SESSION.

The Convention was called to order by President Norcross at 10 A. M.

Mr. W. Worth Bean acted as Secretary, owing to the unavoidable absence of the Secretary on business for the Association.

A telegram was received from Mr. W. H. Frund regretting his inability to be present.

Mr. H. II. Wait being absent his paper on "Street Lighting" was not read.

Mr. Louis A. Ferguson, of Chicago, presented a paper on "Storage Batteries for Small Stations," which brought forth a discussion in which the President, and Messrs. Copeland, Swenson and the author took part.

Prof. B. V. Swenson then read a paper written by himself and Prof. Richter on the subject of "Practical Testing of Small Lighting Plants,"

A unanimous vote of thanks was then extended to Profs. Swenson and Richter.

Mr. F. E. Hatch, president of the Hatch Electric Smelting Company of Green Bay, Wis., next addressed the Convention on the subject of his patented electric smelter, in which he said: "My process is one of roasting, burning or smelting by electric heat. I multiply my heat 42 times over what it is in the ordinary form of furnace."

The meeting then adjourned to meet the next day.

THURSDAY-MORNING SESSION.

The Convention was called to order by the President at 11:30 o'clock.

Prof. George D. Shepardson, who was absent, sent in his paper on the subject of "Why Some Municipal Plants Do Not Pay," and upon motion it was unanimously decided to print the paper in the transactions of the Association.

Mr. Copeland—I am under the impression that the Secretary-Treasurer's office will run a little bit short. The Secretary has done a vast amount of work this year and I know that the income of the office is really insufficient to cover the expenses, and I wish to offer this resolution:

Resolved, That the sum of \$200 be and hereby is appropriated for the use of the Secretary-Treasurer for the year 1900.

The resolution was unanimously adopted.

The Secretary—I think it is generally understood among the members that the office of the Secretary-Treasurer and the emoluments thereof hardly warrant any one feeling a large financial interest in the Association, and that the work has been, so far as I am concerned, purely a labor of love and interest in the Association. I feel of course gratified at your action in the matter, which I take as an indirect compliment to myself, and beg to assure you that up to fifteen minutes ago I had not the slightest idea that any such action was contemplated or any such resolution proposed to be offered. (Applause.)

Mr. Copeland—I did not consult Mr. Mercein, on this subject at all,

The Secretary—I move that there be spread upon the record a vote of thanks of this Association, its officers and members, to Mr. I. P. Lord and Mr. W. B. Baker, for their untiring courtesy connected with this Convention; also to Messrs. James Wolff, W. W. Low and George S. Whyte for their individual efforts to make this Convention a success, and finally to the ladies of Waupaca for the many courtesies that they have extended to the Association. The motion was carried.

The Convention then adjourned until January, 1901.

#### PERSONAL MENTION.

Mr. Albert C. Farrand, formerly of Oshkosh, Wis., was recently elected city electrician of Atlantic City, N. J.

Mr. Edgar W. Brown of Troy. N. Y., will sail from Cape Town, South Africa, July 11 for home. Mr. Brown, who was formerly with the General Electric Company of Schenectady, has been in South Africa for a year and a half, tilling the position of electrician for the company which operates the tramway system at Cape Town.

#### AUTOMOBILES AS A SOURCE OF REVE-NUE FOR CENTRAL STATIONS.\*

BY ELMER A. SPERRY.

(Concluded from page 390.)

In electric road traction the consideration of prime importance is the battery. What is its efficiency, its durability, and above all, at what cost will it produce a ton mile?

We will confine our attention in the following remarks to that class of storage battery known as the lead-lead element. These batteries are of two general kinds: the one having its active material formed or developed from metallic lead—Planté's process; the other having its active material mechanically applied—the Brush or Faure process.

A prominent German writer, giving results of recent tests, states that an average carriage with a Planté battery would run twenty miles per charge, the battery weighing 1,260 pounds, yielding 2.8 ampere hours per pound, 5.25 watt hours per pound, and requiring fifty-one pounds of battery per ton mile, whereas, with the Faure battery of the same capacity he found the weight to be 980 pounds, yielding 3.6 ampere hours per pound, 6.5 watt hours per pound, running the same carriages an average of twenty-nine miles requiring thirty pounds of battery per ton mile, showing a life of 3,000 and 4,000 ton miles. This simple report reveals the fact that batteries of different weights, though possessing the same capacity, will propel the same vehicle different distances, requiring a marked difference in the pounds of battery per ton mile. One of the highest engineering authorities on storage batteries recently stated:

"The advantage which would follow the introduction of a high-capacity cell would not be merely the extension of the radius of action of the electrical vehicle, but would be a lengthening in the life of the battery itself. This is brought about by the fact that it would almost entirely remove the most powerful cause for deterioration,—that of over-discharge. Present batteries have twenty to thirty miles capacity. In the case of a battery capable of propelling a vehicle sixty miles on one charge, only the most inexcusable carelessness could bring it to the state of complete discharge, for ninety per cent. of the discharges would be for distances of less than thirty miles. Under these circumstances the battery would be seldom discharged over fifty per cent. of its capacity, a condition of affairs which would insure a greatly increased life, probably between four and six times the life under present conditions.'

The importance of proper manipulation, also proper adjustment of the capacities to the work to be performed, is here emphasized. Not only will it be seen that the life of the battery is improved, but, what is more important, the cost per ton mile is also materially reduced. In this connection, it will be interesting to investigate the relation of the cost of operation per mile due to this factor, namely, the storage battery. Very little, if any, literature is available on this all-important subject, and, in fact, so little experience up to the present time has been available, and so little information has been given out, that it is not surprising that only meager records of this function exist.

Beginning with the supposition that the present heavy batteries, namely, those yielding about two and three-fourths amperes per

pound, are possessed of a given life, certain deductions will be made by introducing series of variables yielding results and data, the bearing and significance of which is of more than passing interest.

Before entering upon a more detailed discussion, it might be well to state the result of more general observations in this line. The desirability of the electrical system of traction, the extent of its adoption, and consequent extent of the demand of the central station for supply, will depend upon the earning capacity that can be demonstrated. The value and present cost of the same work are known factors. The question remains, what is its cost under the new conditions? Under practical conditions of operation, a battery having a life equal to 1,000 ton miles will drive a vehicle weighing a ton 1,000 miles, or a vehicle weighing two tons 500 miles. For purposes of illustration of the possible cost of this factor let us assume that this battery costs \$500. It will then be seen that each cab mile covered in the latter instance will cost one dollar, which would, of course, be prohibitive. Nevertheless, it is a fact that batteries have been made and marketed, and, what is still more serious, others have been so misused in practice as to have a life less than above assumed. Suppose the average life of the battery to be five times that assumed, the new cost per cab mile will be twenty cents.

In the early stages of any industry, conditions are often found to exist, the practical results of which, though startlingly disappointing, are finally met and overcome, and especially is this true where the result is an important one, and where capital and skill are available. This is most certainly true of the art under consideration, and within the past year advances have been made that are favorable in the extreme; advances that are destined to reverse the adverse verdict, and to place the art of electric road traction by batteries high above possible criticism.

Taking unity as a basis of the battery factor in the cost per mile, we will proceed to introduce the variables as to weight and cost, and to note the results. Suppose we assume that the heavy battery is about half the total weight carried. Engineer Maxim, in his Milwaukee paper, says forty-five per cent.; this is close enough to fifty per cent. for present purposes.

First, assuming a battery of same capacity to weigh one-half. It will at once be noted that the vehicles carrying battery of one-half the present weight can easily be made one-eighth lighter, giving a total reduction of weight of one fourth plus one-eighth or three-eighths. The capacity remaining the same, the lighter combination, or new carriage, will be propelled unity divided by 625, or 1.6 times its former mileage. This factor—1.6—represents the new mileage, yielding the new cost per mile of five-eighths, or .625. In the above calculation it has been assumed that the lighter battery costs the same as the heavier battery, or twice the cost per pound.

Light battery costing the same per pound as heavy battery. The cost is now reduced to one-half, but the battery is of the same capacity, and will propel the vehicle 1.6 times its former mileage. Introducing this factor, we have a new cost per mile of less than one-third (.31).

Important reductions in cost per pound of battery have been made during the past year. Let us now assume the following:

Light battery costing one-half per pound of the heavier battery, the cost becomes at once one-half of one-half, or one-fourth; but we must still introduce the mileage factor of 1.6, which yields 1.5, or a cost per mile of one-seventh (.155).

In the above calculations we have assumed only the original life of the batteries, with no renewals. It is found in practice that vehicle batteries with the renewals cost about one-half the first cost of battery, and the life by renewing is extended half the former period; a condition, it will be observed, that does not alter the cost factor per mile.

It has been found that a battery when exhausted weighs as much, and is possessed of its full quota of chemical Pb., and though heretofore it has been difficult to recover any portion of its original cost, at present, with the batteries of one maker at least, it is possible to recover and re-use the exhausted material over and over again at slight additional cost, the original total investment in lead being practically the only investment required.

Assuming, now, that these renewals be made at half original cost, and that the batteries be carried through only four such renewals, it is found that the whole battery cost and energy produced throughout its extended life is sixtenths of that during the first period, which alone has been considered above. Introducing this factor in the last result, we find a cost per mile of practically one-eleventh (.094).

Advances in the art have, however, gone further than reducing the weight of battery by one-half, and it is now possible to obtain on the market batteries of excellent life that have the original capacity with one-third the weight. With such a battery a vehicle required to carry one third weight of battery can easily be made one-sixth lighter, making a total reduction of the combined weight of one-third plus one-sixth, or one-half. This battery, having the same capacity, will push the lighter vehicle a distance of unity divided by one-half, or twice the mileage possible with the heavy battery, or at a rate of cost per mile of one-half (.5).

The last result assumes that the light battery (one-third weight) costs the same as the heavy battery.

Light battery costing same per pound as heavy battery, the weight being only one-third the cost will, therefore, at once be one-third. But it will still drive the carriage twice the mileage, yielding a total cost per mile of one-sixth (.166).

Light battery costing one-half per pound, there being one-third the weight, the cost will at once be one-sixth; the battery, still having the original capacity, will propel the carriage twice the mileage, as above, and will yield a total cost per mile of one-twelfth (.0833).

Carrying this battery through a course of four renewals under the conditions above stated with reference to renewals, we find that through the extended life of the battery the cost per mile has been  $(.0833 \times .6 = .5)$  equal to one-twentieth (.05).

The realization of these sweeping reductions in cost is all-important. The results are evidenced as follows: Vehicles with live load, total weight of one and one-third tons, have yielded 1,000 miles per discharge with batteries weighing less than 1,000 pounds. Partial realization of the desirable features yielding the results above given, will work economies that are proportionate. The above calculations are given not only as indicating the high point that has been attained in the development of traction batteries, but also as indicating the line in

<sup>\*</sup>Paper read at the Twenty-third Convention of the National Electric Light Association, Chicago, Ill., May 22-24, 1900.

which future effort should be directed for still further advancement.

As showing the position of this country in this most important work, and especially the recent developments and advances on this side, reference will be made to the competitive tests recently concluded in Berlin in connection with the International Motor Car Exhibition in that city, which were productive of important and valuable data regarding electric motor vehicles. Not the least interesting is the average weight of battery to the ton mile. This figure is named as twenty-eight pounds per ton mile, but recalculation shows it to be nearer thirty-pounds.

It will be seen in the test recorded from the German authority quoted earlier in the paper. that the values of thirty and fifty-one pounds per ton mile were assigned. Values in this country for vehicles most frequently range between twenty-eight and fifty pounds. As the result of experience, the author would state that this value should be held at or below ten, and vehicles that can easily show this value are in daily commercial service; which makes an extremely favorable showing. So light a battery lends itself readily to the duplication of batteries referred to as creating the necessary diversity factor. The results of the battery tests. so-called, made under the auspices of the Automobile Club of France, recently concluded, indicate that the best results may be expected from batteries in which the active material is retained with, or its retention in place upon the grid is materially aided by, the use of proper envelopes; this being especially true with traction batteries. Furthermore, every means should be employed to shield the battery and to insulate the same thoroughly, not only electrically, but especially against jar and vibration. It has been demonstrated that concussion and molecular vibration are factors tending most seriously to disintegrate the elements. A plan has been devised that seems destined to secure this result: it affords a cushion support for the individual plates by the simple device of rendering the cap of the plate supports within the receptacle elastic and yielding, thus allowing it to perform the function of a cush-

As a result of the past five years' observation of and close contact with this most engrossing work the author can assure station managers that the time has arrived when traction batteries, under conditions of vehicular traffic, are making excellent records and showing commercial results that are most satisfactory. At last this element of great mystery and uncertainty, and the one that has beclouded the electric vehicle world from the first, has cleared from the horizon, leaving only known factors, with which we may deal with certainty.

The success of the electric vehicle being thus assured, a steadily increasing demand for current is sure to follow, which will result in large business. This field belongs to the central station by right of discovery; but history repeats itself, and the opportunity will be lost if the territory is not occupied and its resources developed. The central-station organization and equipment is the proper guardian and natural source of expert service and attendance for both battery and machinery, and will naturally be looked to to foster the interests that it shares with the vehicle operators. It has not been demonstrated that central station owners should not be the principal operators themselves. Much can be said in favor of such a combination. In any event, they

should closely ally themselves with this important industry, and the earlier a practical experience is had by the station men themselves, the sooner will they understand the needs of the business, and the sooner will they be prepared to guide their patrons into a successful and widespread use of electric road-traction.

#### OUR DUTY TO EACH OTHER.\*

BY C. W. KLINE.

My text is our duty to each other, and I deem it proper to give a brief review of the telephone field in the United States from its inception down to the present.

A great many years ago the telephone was invented, but was very slow in coming into use because of the great expense attending its installation. It was a luxury that only the rich could indulge in, and the service was far from satisfactory. The threads were gradually but surely gathered together under one monster head, an absolute monarchy, and it thrived and lined the pockets of its owners with great wealth; it reached out in every direction and embraced every town of any importance in the United States. The monster monopoly, known as the American Bell Telephone Company, owned all the patents, or at least thought it did, by which a telephone could be manipulated, and tried to so shape its affairs that it could maintain this monopoly for a long time to come. It was autocratic in its terms and conditions and careless of all complaints made by the business world, to whom the telephone gradually grew to be a necessity; and the result in the telephone world is the same to-day as it always has been and always will be when corporations or individuals try to over-reach themselves and by reason of their monopoly compel exorbitant charges for inferior service. The business world begged for better terms, complained of the extortion, asked for fair treatment and lower rates, but the monopoly was so firmly established and controlled the field so absolutely that for the time being nothing could be done. Many of the men interested in the monopoly saw the handwriting on the wall and tried to adopt a more liberal, businesslike policy, tried to get better service and lower rates, but they were in the minority and were not able to accomplish anything. A few years ago some of the Bell patents expired, and very soon companies were organized, charters applied for, capital invested for the purpose of establishing independent plants and securing to the general public first-class service at rates the community could afford to pay. These operations have been going on over the length and breadth of our land, and very soon at the present rate of building lines in the whole country, in every city, town, hamlet, village and even farm will enjoy the blessing and privilege of telephone service at rates they all can afford to pay.

Now as to our duty to each other. Our first and paramount duty to each other is to stand together, united in favor of every interest that effects our cause, and as a means to bring about such a union, the Independent Telephone Association of America was organized some years ago from among the independent companies then established, and it has already done wonders to advance the independent telephone interests in the United States; and

our very first duty after securing our charter for an independent telephone company is, to apply for admission to membership in this great Association, pay our dues and sustain its board of control. We have a common business foe to oppose us in every step we take, an opponent with vast experience, who is perfectly familiar with the whole field, and who will take all the advantage possible in every weak point of our armor, an opponent that will at every step of our existence try to disorganize us and keep us disunited. Let me give you an illustration of their work. I am the president of a small independent telephone company at Hazleton, Pa., known as the Anthracite Telephone Company. We have about five hundred phones in lower Luzerne, Carbon and Schuylkill Counties, and among those 'phones we happened to get a few bridged instruments. The octopus with one of its tentacles found them, and at once asked the United States Court for an injunction against us for infringing the Carthy patent. The result of that contest is know to the whole telephone world. How was it brought about? I will tell you. (1) The American Electric Company and the Via duct Manufacturing Company, who sold us our instruments, stood by the letter and spirit of the contract with us, and united for defense, and over and above it was the powerful arm of the Independent Telephone Association of America, of which we were members, who employed counsel, secured testimony and presented to the court such a masterly defense that the enemy was completely routed. No one company, no one manufacturer, no not several of them joined together could possibly withstand the fight with the Bell. They can harass, annoy and drive us from the field, and our only remedy is to stand together, because our interests are in common; every independent telephone company in the land should stand by the Association. A small initiation fee, and a small per capita charge for each independent telephone in the United States will create a fund out of which it will be possibe to defend every point attacked. Whether the independent telephone company is rich or poor, we owe as a duty to ourselves to encourage and foster the erection of independent plants at every point in our land where service can be rendered. If you do not have the financial strength to give your neighbor service, then encourage him in striving to establish such service; give him the benefit of your advice and co-operation; help him to so build his lines that they will answer for the future as well as for the present. Too many of our independent telephone lines are built of cheap material with common returns, inferior switchboards and poor equipment. While this has often been the case in the past, it should never be the case hereafter. Let every plant be built in the most substantial manner, and of the best material. While the first cost will be greater, the efficiency will also be so much greater and our patrons will be so much better satisfied. Then it is a duty we owe to each other to build all our plants so that when toll lines that are now marching over the mountains and creeping over the vales are ready to connect with us efficient service will be rendered. I know there is quite a temptation to use cheaper material, when at the same time we can give fair local service. When iron can be bought for nearly one-fourth the price of copper, we are tempted to use iron, but sooner or later you will be sure to regret it. The very best is none too good. Anothe

<sup>\*</sup>Paper read at the Fourth Annual Convention of the Independent Telephone & sociation of the United States at Cleveland, O., June 12-14, 1900.

duty we owe to each other is not to infringe on each other's territory. Let each local company have the territory that properly belongs to them, and must not attempt to parallel their lines. If you do, it will in the end prove a useless waste of money, and I am sure with a little effort you can harmonize your difficulties and reach a result satisfactory to all interested. We must bear and forbear in the telephone world the same as in other business matters if we wish to succeed, and we must always remember that we have a strongly entrenched opponent to fight, and we cannot afford to carry on a guerrilla warfare among ourselves or fritter away our strength on little difficulties that can easily be harmonized. If you disagree with your neighbor, agree to refer the dispute to a competent referee, say the advisory board of the National Association, and agree to abide by their decision in the matter. Be neighborly, advise with each other, help each other in every manner possible. By so doing you will secure the greatest amount of efficiency at the least possible cost, and each of you will benefit by the experience of the other.

Another great duty we owe to ourselves is to give our patrons in the independent field long distance service at the earliest possible moment. Already giant strides have been made in this direction, and if we work in harmony soon the entire United States will be covered with toll lines such as the wildest telephone enthusiast has never dreamed of. Telephones are no longer a luxury, but are now an absolute necessity, and the business world can no longer do without them, and we, who would be the most successful purveyors of the public requirements along these lines, will be the most successful in advancing not only our own individual and financial interests, but the interests of the independent telephone companies throughout the United States and the world. The aggregated value of the independent plants in the United States already makes an immense showing, but it is nothing to what will be shown in the future under proper management. And along these lines the independent companies owe a duty to each other. Don't start too many long distance companies. No good can possibly come of any such attempt. It is far better to harmonize your interests, and let either one or two companies, I really think one is sufficient; and I would advise you to pool your interests in one company, and toll line a State or even two contiguous States. A toll system under one competent head will prove more satisfactory, and will be far better managed than half a dozen systems under as many different heads. Under the latter arrangements there are bound to be misunderstandings, clashes of authority, inefficient service and dissatisfaction. An old adage says that "Too many cooks spoil the broth." The State of Ohio and some of the other Western States have already shown us how efficient this service can be made if properly handled. Let the States that have not as yet built long distance lines profit by their example and follow in their footsteps. It may sometimes happen in a State that three or four long distance companies take out charters, get contracts with local companies, all with the same intention of giving long distance service. When such is the case, my advice to you all is to get together, turn all the grist into one mill, and be sure to select the mill that has the greatest and best grinding capacity.

It takes money to build toll lines. You can-

not do it on wind or paper contracts; and after all, what every independent company wants now that they have first-class local service, is long distance connections, the very best obtainable, and they want it as soon as possible; and the means that will reach this result are the best means for all of us, and should receive our united support. If we can for a while brush away the crumbs of selfishness that are gathering in our pathway, and remember there are others with equal claims to ours, we will soon be in proper mental condition to bring about the harmonious results, and the sooner we will be able to bring about first-class local and long distance service. The opportunity is ours if we but decide to approach the question in a spirit of fairness. Let us pool our issues, wipe out our disagreements, stand heart to heart, shoulder to shoulder in an onward and upward march to telephonic perfection. Let the spirit of our sires fully imbue us with that old truth, "United we stand, divided we fall."

### OPERATING ECONOMIES IN CENTRAL STATION PRACTICE.\*

BY W. L. ABBOTT.

In every central station there grow up characteristic systems of practices, good, bad or indifferent, due partially to peculiar environments and partially to the ability of the operating force. Through natural selection the best of these practices are gradually crystallized and become the unwritten code of rules for the direction of the internal affairs of the station. Some of these practices, while the very best for that station in which they originate, may prove very unsatisfactory when transplanted into other stations; yet it is largely due to the cordiality with which central station managers impart to and adopt on trial from each other new methods that the present rapid improvements in operating details are being made.

The saving with renovating of waste and oil is an ever present and variously handled question in all stations. Some simply use the waste until it is oil soaked and then burn it under the boilers; others go to the other extreme and use wiping towels, which are carefully saved, washed and used over again. We favor a middle course, using a good quality of waste, first on the finer parts of the machinery and then for coarser work, after which it is put through a washer consisting of a train of rolls, over which hot water is running. This extracts nearly all of the oil and much of the dirt.

The oil and water are caught in a receptacle, the oil separated and passed to the oil purifier and the waste is put into the drier. This drier consists of a sheet iron box 30 inches square and 6 feet high, filled with shelves, one above another, made of wire netting and spaced about ten inches apart, for the reception of waste to be dried. The case stands a few inches from the floor, and in the bottom, which is open, is a steam coil. A door occupies one full side, and to the top is connected an 8-inch galvanized pipe leading to the boiler breeching for the purpose of inducing a draft. whole thing is quite simple and inexpensive, yet it will thoroughly dry a charge of 200 pounds of damp waste in a few hours. This dry waste is somewhat harsh and knotty, but

has better absorbing qualities than new waste, and we use and wash it over and over again.

The oilers are allowed but ‡ pound of new waste on a shift to keep a 1,200 horse power engine clean, but they are allowed all of the washed waste they want. In separating oil from waste it is difficult to say which is the by-product and which the direct product, as from 100 pounds of oily waste we get 40 pounds each of oil and waste, and one product is about as valuable as the other.

The amount of engine oil used at our Harrison street station has been reduced to the lowest possible minimum I think, as it amounts to only about 50 gallons of new oil each month. This is obtained by catching and refining all the lubricating oil used on our machinery, which is quite readily possible on vertical engines. The drains from our crank pits are carried down into the oil refiners, and the oil from the waste is all saved and put through a process which makes it better than new oil. This may sound like an exaggerated statement, but I will explain later on why it is better than new oil. I have spoken of oil retiners and of refining the oil, instead of filters and filtering the oil, for the reason that we have no filters and do no filtering, but purify the oil by settling and boiling. Our refiners consist essentially, of three upright cylindrical tanks, the first of which receives the oil from the engines mixed with cylinder drips and water from journals, etc. In this tank, which is half full of water and half full of oil, the water and oil separate. The water goes to the bottom, where it is drawn off through a trap. The oil goes to the top and is drawn off through an overflow leading to the bottom of the second tank, in which is a steam coil under a pressure of about 100 pounds. This is for the purpose of heating the oil up to about 250°, at which temperature the water is driven off in the form of steam.

Owing to the surface tension of the oil around the small globules of water held in suspension, the water will not vaporize at a lower temperature. This tank is of such a capacity that the oil is about two days in passing through it, and it then goes to the bottom of the third tank, where it is allowed to stand about the same length of time and where any sediment it may contain will be deposited. From the top of the third tank the oil overflows into a large storage tank, where it is kept until drawn off to be used. Few of those who have not looked into the matter would realize how much water will be absorbed and held in suspension by oil which contains a small trace of animal matter and how difficult it is to break up the combination once it is formed. Those of you who operate oil filters may have sometimes wondered at the accumulation of grease in them, this grease being a soft, jelly-like substance of the consistency of warm lard, or perhaps even thicker. This grease is no more than a combination of mineral oil, a small trace of animal oil and about 40 % water. If it were placed in a vessel and heated to about 250°, the water would be driven off (perhaps with explosive force if heated too rapidly, but if the work is carefully done the water can be separated), and what is left would be the best kind of lubricating oil, containing a small trace of animal oil and in our case, all the cylinder oil from which the animal oil is derived. It is the mixture of the cylinder oil with the engine oil which gives it. its heavier body and better lubricating qualities. The oil which is expressed or washed out from the waste apparently contains more

<sup>\*</sup>Abstract of paper read at the National Electric Light Association Convention, Chicago, Ill., May 23, 1900.

cylinder oil than that which comes from the engine drains, and on this account those who throw away their waste, not only lose the waste, but the richest part of the oil which is contained in it. That this amount is considerable will be seen from the fact that from every 100 pounds of oily waste we get about 40 pounds of clean waste and 40 pounds of oil.

The question of cylinder lubrication was once a very perplexing one for us, but after studying and experimenting we settled the question in such a way that it has not been open for several years. We had great trouble with cylinder oil, and had difficulty in finding an oil which would lubricate all of the cylinders of our triple-expansion engines from one lubricator. We have not found such an oil and do not expect to. We could find an oil which would lubricate the high pressure cylinder, and we could find an oil that would lubricate the low pressure, but we could not find  $\boldsymbol{a}$ combination which would lubricate all of the cylinders perfectly. We have therefore, adopted an oil which will lubricate the high pressure cylinder excellently and the intermediate cylinder moderately well, while the low pressure shows only a slight trace of oil. As there is no cutting or scratching in the low pressure while it runs dry, and as the high pressure cylinder makes a prompt and vigorous protest if allowed to run dry for a few moments only. we have adopted the oil which will give the best results in the high and let the low be content with what it gets.

The results of our experiments have convinced us that the only oil to use in a nonjacketed cylinder, where it would come in contact with very wet steam, is one which is very highly compounded. It must also be an oil of a high fire test, and the reason why it does not lubricate the low pressure cylinder as well as the high is that the temperature of the steam in the low pressure cylinder is so low that the oil will not remain atomized in the steam, but washes down and combines with the water of condensation which has formed in the other two cylinders, and passes through the low pressure cylinder in an emulsion with the To prove this theory I have tried the water. plan of mixing a cylinder oil of a high grade and high flash test with a light oil of low flash test, and feeding it through one lubricator through all three of the cylinders. The result shows a fair trace of oil on the walls of the low pressure cylinder, and we ran our engine with this kind of cylinder lubrication for several months, but finally decided that the best results for the entire engine were obtained with the oil which gave the best lubrication in the first cylinder. We now use a heavily compounded high fire-test oil fed into the steampipe near the throttle. A gallon of oil so fed will give good lubrication for a 1,200 horse power engine for 12 hours. I have seen a compound engine of this capacity fed at the rate of nearly a gallon an hour without obtaining satisfactory lubrication, the whole trouble lying in the fact that the oil was not adapted to the particular conditions under which the engine was working, and I think this may account for the unmeasured praise or unstinted abuse which different brands of good oil receive from different engineers, and I think, furthermore, that the difference between a good oil and a poor oil made from high fire test stock lies almost wholly in the amount and kind of compounding.

In arranging an operating force and the payroll of the central station the superintend.

ent should aim to get the maximum of results with the least expenditure of money and still to keep everything harmonious. To do this he should carefully arrange his force so that he will at all times have men enough to take care of the amount of work on hand, and at no time have a surplus of help over what is required to take care of the work to be done. His scale of wages should also be carefully graded, so that the men doing the same class of work should receive the same pay, and that the rate of pay to the different classes of workmen should be in proportion to the skill, responsibility or manual labor required. Further than this, a considerable saving in money can be made by paying the men partially in hopes and promises. By this I mean to have a welldefined line of promotion, each man knowing his position in that line, and that his chances for promotion depend upon his ability, fidelity and length of time in the service. Any really good, ambitious young man is ready to begin work at the bottom of the ladder, and will work contentedly along on small wages if he is assured that the promotions to come will be awarded upon the above terms and not by favoritism. The most demoralizing and disorganizing practice that can be introduced into a central station is to put a new man, the relative of some official, or the friend of some politician, into a desirable position over the heads of equally good men who have borne the drudgery and hard work of inferior positions, hoping and expecting that when there was a vacancy in a better position they would have the preference.

In many stations the force is divided into a night gang and a day gang, but I never thought this well adapted to central station work. The hours are too long, and it does not give the best distribution of labor, the number of men in the station not varying according to the load. The practice which we instituted several years ago of bringing the men on one or more at a time an hour or so apart and letting them off in the same way can be made to exactly meet the requirements of an uneven load, and enables us to rotate the different men of the same class through all the different shifts during the course of one or two months, thus making the work and the hours of all exactly alike in the cycle. At the end of each week the schedule is made up for the week to come for each of the different classes of operatives interested, and this is posted on Saturday night, so that as the men go off work on the following Sunday it is known what shift each will have during the coming week. These schedules are altered from week to week, increased or diminished as regards the number of men and changed in form to conform to the varying conditions of the load curve.

To illustrate by a set of December schedules: The problem to be solved is to arrange the schedule so that there will be at any time enough men for the work without having too many men around at other times, and furthermore, to arrange the shifts so that none will be obliged to go home between the hours of 1 and 6 A.M. As we are not sure what the load will be from day to day, or a week ahead, we are obliged to provide men enough to take care of what we assume will be the reasonable maximum. With a little care and study, it is possible to arrange the schedule to very nearly meet the exact requirements. Take, for example, the firemen's schedule for the week commencing December 18, 1899. We start at midnight with five firemen; two of these are relieved at

1 A.M., by two other men, who come on at that time. As the load from midnight to 6 A.M. is quite irregular, owing to the variable amount of charge required by the battery from day to day, we have rather more firemen on during this period for the amount of work done than we have during other times of the day. At 6 A.M. the load begins to pick up, and has nearly reached its morning maximum by 9 A.M. To take care of this our force of firemen is increased by one man each at 6, 7 and 8 o'clock, there being by that time eight men on, and the force is held at that number until 1 P.M. During this time several men come on and others leave, but the number at work remains the same. The slight drop of the load at noon is not followed by a corresponding change in the number of men, but it is taken advantage of as a slight breathing spell and gives the men an opportunity to clean fires and eat their dinners. After the mid-day drop in the load there follows a gradual rise until 4 P.M., which we anticipate by bringing a man on at 1 and another at 2 P.M. At 4 P.M. the load rises abruptly to the maximum shortly before 5 P.M. We provide for this by bringing three men out at 3 P.M., to get their fires in good shape, ready for this hard pull, and, finally, at 4 P.M. the last man comes, which brings the total number of firemen on at this time of the day up to 14 men. After 5 P.M., the load gradually declines, until at midnight it is only about one-fourth as high. Owing to the way in which the men have been brought out their shifts are finished so that the force is automatically decreased in proportion as the load decreases, and we have during the day worked 21 firemen, who have altogether burned about 200 tons of coal, and have been so distributed that we have at all times had an excess of one or more men for the work, and none have been overworked.

The greatest possibilities for saving or wasting about a steam plant are undoubtedly in the coal pile, but the subject does not receive the consideration to which it is entitled. average ambitious englne man will spend much time and care on his engine to be sure that the indicator cards are perfectly symmetrical, that the points of cut-off are equal, that the release is in time, and that the compression rises to meet the admission in a smooth, rounded curve. This is proper and commendable; yet the same time spent in studying the conditions of combustion in his furnace might show him a way to make a saving in fuel fourfold greater than is possible in the final refinements of the indicator cards. A fireman whose wages amount to, say 20 cents an hour, will burn during that time fuel costing 10 and 15 times as much as his wages. It would not be possible by any sort of driving to save half of the wages, but it is readily possible, by properly watching and instructing the firemen to save double his wages in coal. In the first place, great care should be exercised in the selection of the coal to be used. I believe that the cheapest coal is that kind which has the greatest amount of combustible for the least amount of money, provided the furnaces are of the proper kind and ample in capacity to make the required amout of steam from them. The very cheapest kind of Illinois screenings, costing less than \$1.50 a ton, will not have less than 10,000 British thermal units a pound, and the very best of Eastern lump, costing \$4 a ton will not have more than 14,000 British thermal units a pound. This means, then, that for equivalent heating qualities the cheapest

screenings cost about half as much as the high grade coal.

Having selected the coal, the next problem is how to burn it properly. It is commonly understood that 12 pounds of air are needed to properly burn 1 pound of coal. It is also commonly supposed that in practice about twice this amount of air passes through the fire, but just how much actually passes, and under what conditions are the best results obtained are impossible to determine without making analyses of the flue gases. Fortunately, this has now become a very simple operation, and one which can be performed and understood by anyone competent to take charge of a large boiler room. These tests often show the most surprising and disappointing results. The analyses are made to determine the percentage of carbon dioxide in the flue gases. Under perfect conditions it can run as high as 20 per cent., but it is not unusual to find samples running as low as 2 per cent. of dioxide. This brings down the economy for two reasons: (1), the gas in the firebox is diluted with an excess of cold air and cooled down, and (2), the amount of gas being increased in volume passes the boiler more rapidly and does not give up so much of its heat. It is almost a paradox that within reasonable limits the more the gases are cooled down in the furnace by the admission of excess of air the botter they will pass away from the boiler. The two causes of excess of air in the flue gases are running boilers on too light loads and careless firing.

In a station where the load is much higher for a few hours than during the rest of the day the tendency is to have too many boilers in service during the period of light load. The natural result is that the fires are run thin, the grates get bare in places, a great volume of air is drawn in and only a small portion of it comes in contact with the fuel. Careless firing is always a flagrant waste of fuel. An engine man may be aware that he is not getting the results which his tests lead him to believe he should have, and yet in a boiler room where several men are working it is exceedingly difficult to fasten the blame on any one of them unless one tests the flue gases.

To follow intelligently the work of the individual fireman we have installed in our boiler room a device called the econometer, through which is induced a small current of gas from a boiler breeching. The weight of this gas changing with its composition, moves a pointer across a dial; thereby indicating continuously the varying percentage of carbon dioxide in the flue gas. From this device are run individual pipes to the breeching of each boiler, and all is so arranged that samples may be drawn from several boilers and tested in a few minutes, or a continuous test may be made of the performance of any one boiler. Readings taken from this instrument at regular and short intervals, when plotted, form a curve which is a very comprehensive record of the conditions of combustion during the time of observation.

#### Wireless Telegraphy with Balloons

Messrs. J. Vallot and J. and L. Lecarme have contributed to the "Moniteur Industriel" a note on their experiences with wireless telegraphy in a balloon. They state, says the "Electrical Engineer," London, that the object of the experiments was to discover whether it was possible to communicate by Hertzian waves between the earth and a free balloon at a great distance, and without a conductor connecting the receiver to the earth. The trans

mission post was at Landy, and was composed of a battery of 10 accumulators, a key, an interrupter, and a coil and oscillator. One of the poles of the coil was connected with the earth, and the other with a receiving apparatus composed of an insulated copper wire suspended from a small captive balloon. The receiver was placed in the balloon, which rose at first vertically. The signals were heard very distinctly in the balloon at an altitude of about 600 yards, the horizontal distance being about three miles. They were still noticeable at an altitude of 900 yards and a distance of nearly four miles, but it was necessary to increase the sensibility of the apparatus. Owing to the direction of the wind, the gasometers at Landy were after a time interposed between the receiving wire and balloon, and the experiments were discontinued after 10 hours, at which time the signals could not be distinguished. The authors conclude that a wire to earth is not indispensable for transmission to a long distance, and that when the balloon at first rises vertically to a great height the signals could be clearly heard, although the two antenna were a prolongation of each other, and that the normal planes of their extremities were parallel and separated by a great distance. In concordance with the results obtained at Mont Blanc, the difference n potential between the two posts did not seem to affect the working of the apparatus.

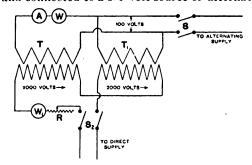

#### CURRENT-RUSHES INTO TRANSFORM-ERS.\*

#### BY R. C. CLINKER.

It is a well-known fact that at the instant of switching a transformer or a group of transformers on to a live circuit, a momentary rush of current often takes place through the primary winding. This manifests itself usually by a kick of the ammeter, if one happens to be in circuit, or by a loud hum which dies away to the normal sound within the first few seconds. The explanation of the effect is probably this: The magnetic condition of the iron before the transformer is switched on demands upon that point in the cycle at which the switch was last opened. The magnetic circuit being a closed one the iron has no poles which tend to demagnetize, hence the induction in the core may have a maximum, zero, or intermediate value, depending upon the instantaneous value of the magnetizing current when the voltage was removed from its terminals. If now voltage be suddenly reapplied to the primary in such a direction that to produce the necessary back E.M.F. a change of induction is required in the direction in which the iron is already highly magnetized, the permeability of the iron is so low in this direction that a large rush of current is necessary to produce the required change of flux. During the next few seconds the magnetic cycle in the iron does not take place around the zero point. Indeed, the direction of magnetization may not even reverse in sign during the first few cycles. The tendency which exists in the iron, however, towards zero magnetization asserts itself, and the magnetic cycle slowly descends from higher values of induction until it takes place around the zero point. One or two interesting experiments which the author made on this point some months ago make this action more apparent. In one a direct current ammeter with well-damped needle (such as a Weston instru-

ment) is included in the circuit when switching on. If this ammeter be of fairly small range, a direct current will be seen to p: ss through the transformer for a considerable time after the circuit is closed. Thus, in the author's test, a 10 kw. transformer was experimented upon, a 5 ampere Weston ammeter being placed in circuit with the 100 volt terminals, which could be switched on to a 100 cycle supply. The normal alternating no-load current was about 1.5 amperes, but a kick of fully 5 amperes could often be obtained upon the Weston ammeter, the direction being of course either positive or negative. After the first kick the needle slowly sank to zero, but in some cases a small direct current flowed through the transformer for fully one minute ofter the closing of the switch. It is evident that this direct current means a continuous change of the total induction linked with the circuit, going on quite independently of the cycle or range of induction-value necessary to supply the back E.M.F.

The effect may be produced more artificially by magnetizing the core in one direction with a direct current, while the alternating voltage is still applied to the terminals. To neutralize the induced voltage in the magnetizing coil, the author used two transformers connected as in the diagram. T and T<sub>1</sub> were two 50 kw. transformers, both of 20:1 ratio. Their low pressure windings were paralleled and connected to a 100 volt source of alternat-

ing supply, two ammeters, one an alternatingcurrent instrument (A) and the other a direct current Weston (W) being included in the circuit. The high pressure windings were connected so that their E.M.F.'s opposed, and a direct-current circuit with resistance and ammeter  $(W_1)$  was introduced in series with them. A direct current could thus be made to flow in both primaries quite independently of any induced voltage.

On closing switch  $S_1$  the ammeter  $\Lambda$  read, of course, the no-load current of T., while no permanent deflection was produced on W, the pointer merely vibrating over the zero. As A was a 60-ampere instrument, this small current produced very little deflection. On closing S2 and allowing current to flow through the highpressure coils, a momentary direct current was, of course, indicated by W, while the no-load current read on A was increased, owing to the lower average permeability of the iron at the higher inductions through which the magnetic cycle was taking place. By reducing R sufficiently, this no-load current could be increased to 60 amperes, the scale limit of ammeter  $\Lambda$ . The interesting point of experiment, however, lay in the effect of suddenly opening switch S<sub>s</sub>. The magnetic cycle, having no resultant magnetizing force left to support it at so high an induction, gradually descended to its normal position, occupying in its descent an interval of at least one minute. For that space of time a direct current could be observed flowing through W. The immediate effect of opening

<sup>•</sup> From the "Electrician," London.

 $S_a$  upon the reading of  $\Lambda$  was to reduce it about one-third, from which value it slowly crept down to the normal magnetizing current. One effect of working at this high induction was to cause the transformers to hum loudly.

The method of connection used in this experiment may also be used to show that the hysteresis loss in the cores is dependent only upon the total range through which the induction passes, and not upon the actual value of that induction, a wattmeter being placed in circuit to measure this in the usual way.

#### LEGAL NOTES.

In the United States District Court of Boston, Mass., a short time ago, Judge Colt gave a hearing in the case of the Thomson-Houston Electric Company and the General Electric Automobile Company against the Exeter, Hampton & Amesbury Street Railway Company, which is a proceeding growing out of the alleged infringement of the complainants' patent, No. 393,323, relating to certain improvements in switches for electric motors. The case came up on a motion for a preliminary injunction to restrain the defendant from making, using or vending or causing to be made, used or sold any apparatus embodying the improvement or invention in question.

On June 29 Justice Scott in the New York Supreme Court set aside a verdict obtained by Paul Hertzog against the Municipal Electric Light Company of Brooklyn for alleged negligence in wiring his furniture store, on Broadway, improperly. The lights were put in in 1892 and a short time afterward the store was burned down. He alleges that defective insulation was the cause of the fire. Justice Scott says the evidence did not prove that the defendant company was unskillful in stringing its wires.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended June 30:

Antwerp, 16 packages, \$1,875; Argentine Republic, 370 packages, \$20,197; Australia, 1 package, \$30; Bahia, 1 package, \$100; Berlin, 1 package, \$15; British Guiana, 1 case, \$7; British East Indies, 81 packages, \$2,490; 20 cases, \$4,-259; British Possessions in Africa, 2 cases automobiles, \$850; 20 packages, \$562; British West Indies, 10 packages, \$144; Brindisi, 10 cases, \$2,150; Brazil, 269 packages, \$8,327; Cairo, 6 packages, \$105, Central America, 102 pounds, \$4,728; Chili, 5 cases, \$161; Cuba, 60 packages, \$1,588; Ecuador, 67 boxes, \$396; Florence, 1 case, \$22; Genoa, 40 cases, \$2,664; Glasgow, 95 automobiles, \$40,000; 16 cases, \$859; Gothenburg, 6 cases, \$230; Hamburg, 45 packages \$4,088; 20 cases, \$5,300; 2 boxes, \$30; Havre, 32 boxes \$5,490: 9 automobiles, \$4,330: 9 boxes, \$650; Hull, 2 cases, \$250; Liecester, 1 case, \$3; Liverpool, 88 packages \$3,754; 4 cases \$40; London, 137 packages, \$9,118; 63 electrical cable reels, \$15,301; 13 cases, \$112; 4 cases automobiles, \$1,700; Manchester, 4 cases, \$650; Mexico, 123 cases, \$2,673; Milan, 1 case, \$5; 5 packages, \$168; Moscow, 4 cases, \$57; Naples, 47 packages, \$10,935; New Foundland, 36 cases, \$1,143. Nova Scotia, 4 cases, \$118: Peru, 9 cases, \$386; Porto Rico, 112 packages, \$11,565; Rome, 1 case, \$8; 3 packages, \$155; Rotterdam, 2 cases, \$18; Santo Domingo, 2 cases, \$20; Southampton, 100 packages, \$3,546; U.S. Colombia, 119 packages, \$2,263; Vienna, 7 cases, \$181.

#### INCORPORATIONS.

The Blair County Light, Heat & Power Company, Altoona, Pa. Capital stock, \$50,000.

The City Light Company, Peru, Ind.-to operate an electric light plant. Capital stock, \$25,000. Incorporators: S. V. Perrott, H. C. Uhlen and A. G. Perrott. all of Peru.

The Colorado City Electric Light & Power Company, Colorado City, Col.-to furnish electric light. Capital stock, \$10,000. Incorporators: C. M. Sherman, C. L. Cunningham C. E. Corcoran, M. Drake and J. R. Watt, all of Colorado City,

The Cementon Electric Light & Power Company, Cementon, Pa. Capital stock, \$10,000. Incorporators: J. S. Wentz of Mauch Chunk; G. D. M. Creary, W. B. Whitney. both of Philadelphia; A. C. Leiseming, of Upper Lehigh, and T. M. Righter, of Mt. Carmel.

The Neversink Light & Power Company, Middletown, N.Y. to manufacture electricity and gas. Capital stock, \$100,000. Directors: Philip A Rorty, William J. Burk and N. C. Mc-Brair, all of Middletown.

The Galaxy Car Company, Poughkeepsie, N. Y.-to manufacture and lease passenger and freight cars used on electric railroads. Capital stock, \$5,000. Directors: E. C. M, Rand, New York City; James L. Williams and Frank Hasbrouck, Poughkeepsie.

The Dutchess Light, Heat & Power Company, Rhinebeck, N. Y.-to manufacture electricity. Capital stock, \$20,000. Directors: George N. Miller, Thaddeus A. Traver and Frank Herrick, all of Rhinebeck.

The Lebanon City Electric Light, Heat & Power Company. Lebanon, Pa.—to supply light, heat and power. Capital stock, \$25,000. Incorporators: D. D. Coleman, E. K. Coleman, A. Brock, H. Brock, all of North Lebanon Township, and J. P. S. Gobin, of Lebanon.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS. at 302 and 304 Broadway (Room 1204), New York City, also at 659 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents, Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon pay ment of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED JUNE 26, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

ELECTRIC RATEWAYS AND APPLIANCES.
652,266. Electromagnetic Brake. Edwin M. Herr, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, same place. Filed Nov. 18, 1899.
652,48. Electric Railway System. Lowell M. Maxham, Boston, Mass., assignor, by mesue assignments, to the Bay State Traction Company of West Virginia. Filed Sept. 20, 1809.

### THE TELEPHONE WORLD.

#### Bell Company Out-Manœuvred.

In the telephone world each new move against the Bell monopoly is watched with eager interest, and success or failure is attended with alarm or pleasure, according to the standpoint of the observer's interest, says the N.Y."Commercial." The opposition to the Bell Company gathers strength as it moves, and has now assumed proportions of consequence.

Its impetus has been increased by the knowledge that the Bell Company has been caught napping on several occasions. It now finds important positions slipping from its grasp.

The opposition has been working very quietly but persever ingly, and three of the most important sub-companies of the Bell Company have passed under other control. The largest of these is the Erie, a majority of the stock of which is now held by the Knickerbocker Telephone Company of New York.

The identity of the other two has not yet been made known owing to the secrecy with which the various moves in the game have been surrounded.

It is understood that the Telephone, Telegraph & Cable Company of America is behind the Knickerbocker in its undertaking to wrest control of the Eastern field from Bell interests. In fact, it is expected that final success in this direction will be followed by the revelation that the Knickerbocker Company and the Telephone, Telegraph & Cable Company are very nearly identical.

The point is that the Knickerbocker Company can accom-

The point is that the Knickerbocker Company can accomplish things impossible to the larger company, for the reason that it has not yet become generally identified beyond the East as a dangerous rival of the Bell.

Three representatives of the Knickerbocker Company are now in the South trying to secure a controlling interest in the stock of the Southern Bell Company, a sub-company of the Bell Company.

This seems a close approach to the impossible, as the Bell Company's policy is to hold 51 per cent. of the stock of its constituent companies, but the same was also true of the Erie, yet the Knickerbocker people succeeded in getting control of the latter.

The Knickerbocker Company has thus far out-manœuvred the Bell at almost every point. Its resources seem to be enormous, and although generally regarded as merely the instrument of the Telephone, Telegraph & Cable Company, it is nevertheless strong on its own account.

The impending telephone war is expected to break within the year, and it will involve the telegraph companies. Both the Postal and the Western Union have been looking for an available system for the last two years, and it is very evident that they each appreciate the fact that their future depends upon their getting into the telephone business.

Experts estimate that the telephone has cost the telegraph companies at least 50 per cent, of their local business, and the long distance telephone has played havoc with their private wire business.

The Western Union has openly avowed its intentions in that direction, but the other telegraph companies have held their plans in secret.

With the big telegraph companies preparing to go into the field, while the Bell is at war with a rival almost as powerfu as itself and supplemented by the Knickerbocker, there is every reason to believe that the public will soon have telephone service, long distance and local, at about half its present cost.

At the annual meeting of the Michigan Telephone Company the following board of managers was elected: Charles E. Adams and Charles J. Glidden, Lowell, Mass.; Frederick A. Farre, Charles S. Tuckerman and Thomas Sherwin, Boston, Mass.; Frederick A. Forbes and Hugh McMillan, Detroit, Mich.; William J. Latta, Philadelphia, Pa.; Martin Maloney, New York, and Dudley E. Waters, Grand Rapids, Mich. The board elected Charles J. Glidden, president of the Erie Telephone system, president; Charles E. Adams and H. J. Pettingill, vice-presidents; George B. Perham, secretary; Charles A. Garnt, treasurer. The treasurer's report showed gross earnings for the year of \$783,300; net earnings, \$148,250. Five per cent. in dividends have been declared.

The People's Home Telephone Company, which will build a system in Birmingham, Ala., and the surrounding little towns, has commenced work on its plant. The order has been given for its conduits, wires, poles. instruments and other materials. A building permit has been issued the company by the city for the construction of a four-story brick and steel building almost in the heart of the city, which will be used as the exchange.

The stockholders of the Virginia Long Distance Telephone Company met recently in Staunton, Va., for purposes of organization. A charter will be secured and the work of connecting all parts of Virginia and West Virginia will be begun The company is independent of the Bell interests.

The sale of the Fulton Chain (N.Y.) Telephone Company's lines, which was recently reported, has been declared off. D. B. Sperry, the general manager of the company, says that the proposed deal is off, and that there will be no change in the management of the company. Arrangements have been made with the Central New York Telephone & Telegraph Company for a "through" long distance circuit between Utica and Old Forge. The Fulton Chain Company will build a new copper line from Old Forge to Boonville and the Central New York Company will extend its circuit over its line direct to Utica. This will insure prompt and reliable telephone service to all Fulton Chain points.

Carrying out the terms of an agreement, the Erie Telegraph & Telephone Company deposited last week with the Old Colony Trust Company of Boston, Mass., stocks in the five subsidiary companies controlled by the Erie to the par value of \$5,000,000 and estimated market value \$6,500,000 to secure \$1,000,000 Erie debenture bonds due in 1928, already issued and sold. The entire Erie bond issue of \$10,000,000 is now collateral trust bonds, being secured by stocks of the subsidiary companies. The aggregate par value of the subsidiary companies stocks of the Erie system is \$23,000,000 and the estimated market value, based on present prices of telephone securities. is \$30,000,000.

An independent telephone company is being organized in Oakland County, Mich., to give toll rates to every point in the county for 5 cents where now in some cases they are as high as 30 cents. By December the company expects to have every town and hamlet in the county connected. The organizers think this is the solution of the telephone question—each county to organize its own company. The old company recently advanced the Detroit-Pontiac rate from 10 to 35 cents.

Marshfield, Wis., will soon be the telephone hub of Wisconsin, as it is now the railroad center. Lines will at once be built to connect Marshfield with all of the surrounding towns, two independent companies having been organized for this purpose recently. The system will include Wausau, Grand Rapids, Marathon City, Edgar, Fenwood, Stratford, Mosinee, Athens, Pittsville, Bethel, Vesper, Arpin and several other less important points.

The Bell Telephone Company is hard at work establishing its new plant in Columbia, S. C. The new exchange will be on the ground floor of the Kendall building. Owing to the amount of work to be done it is feared that it will be impossible to get the plant in operation before September 1. The new work, it is said, will mean an outlay of some \$20,000, and the employment of a considerably larger office force. The lines will also be extended.

Superintendent Pease of Huntsville, Tenn., has finished the work of equipping the local exchange of the Bell Telephone Company with metallic circuits. Every telephone in the system is now connected with two wires, and the service is much improved.

Notwithstanding the wonderful development, Stockholm Allamanna Telefonaktiebolag (Telephone System) made a net gain of 3,000 subscribers for the fiscal year just closing. Under the able management of its president, Mr. H. T. Cedergren, Stockholm has the largest number of telephones in ratio to population in the world.

The New York Telephone Company is applying to village authorities throughout New York County for permission to put their wires under ground and work has already begun on changing the wires from poles to subways in the western part of the county.

The People's Telephone & Telegraph Company has begun the construction of a telephone line between New Market and Morristown, Tenn. The poles have been distributed Work will be pushed on the line, and it will be completed in thirty days.

At a meeting of the Kearsarge Telephone Company (f Salisbury Heights, N. H., it was voted to increase the calital stock from \$4,000 to \$7,000; also to extend its wires to Andover N. H.

The New England Telephone & Telegraph Company is to string its lines from Rochdale to Worcester, Mass., by way of Auburn, instead of through Cherry Valley and Leicester. The work will begin at once.

The Central New York Telephone & Telegraph Company has a large number of men at work in Rome, N. Y., setting new poles and improving their line in every way.

Telephone communication has been established between Bryan and Rogers Prairie, Madison County, Texas.

### Growth of the Independent Telephone Company.

The rapid growth of the Telephone, Telegraph & Cable Company of America is shown in a circular just issued by the company to its stockholders. Although the new rival of the Bell Telephone Company is less than a year old, it already owns 362 exchanges in twelve States and three large cities, has 128,000 telephones in use, and 17,000 more awaiting connection.

It owns 204,000 miles of wire, 20,000 miles of poles, and there are 65,000 telephone franchises secured and awaiting organization and construction in various towns and cities.

The company has also secured by absolute purchase patents on telephone, telegraph, cable machinery and wireless telegraphy which are considered valuable. It is announced to the stockholders that the company will not pursue the policy of purchasing independent plants, especially those in isolated positions. The board of directors is considering the idea of terminating the assessable feature of the shares under conditions which are regarded as favorable to the stockholders.

Advices from Waterville, Me., state that within the course of a few days there will be organized in that city a telephone company with millions back of it, in which men both in Maine and out will have an interest, the object of the company being to introduce a service into that State far reaching in character. For several months now parties interested in the move have been looking the field over carefully, getting some idea of the cost, the towns to be reached, and taking into consideration details needful for perfecting the plan. The matter has been kept very quiet, and that too with a purpose. It was necessary for the company, in order to nake of the line what was desired to get connections out of the State. It is asserted that arrangements have now been completed whereby connections will be made with the Massachusetts Telephone Company, the Erie Company, and the Telephone, Telegraph & Cable Company of New York. All these organizations will enter into the deal, and by so doing, New England and New York is expected to be well-covered and a splendid system provided for long distance use.

At a meeting of the stockholders of the New England Telephone Company on May 7, it was voted to increase the capital stock from \$15,000,000 to \$20,000,000. The issued capital now amounts to \$13,759,100. The constant increase in the number of subscribers, due in part to the low rates at which the party line and measured service is furnished, has demanded a more rapid enlargement of the company's facilities than ever before, and extensive additions to the property are still required. The directors now order that 17,200 shares be offered to stockholders at par. Each stockholder of record July 9 will be entitled to one share for every eight then held. The right to subscribe will expire at 1 o'clock Saturday, July 28. The company will neither buy nor sell rights. Payment for one-half of the amount sub scribed for is to be made August 16, and the remainder November 16. No interest will be allowed on sums paid in advance.

It is estimated that it would cost \$300,000 to build a municipal telephone system in Detroit, Mich., such as has been suggested.

#### TELEPHONE INCORPORATIONS.

The Gauley Bridge, Summersville & Camden Telephone Company, Summersville, W. Va. Capital stock, \$25,000. Incorporators: E. L. Alderson, A. F. Rader, Dr. J. L. Rader, G. Harlow, A. J. Horaw, all of Summersville.

The Rio & Romney Telephone Company, Romney, W. Va. Capital stock \$2,000. Incorporators: J. L. Shanhaltzer of Stony; R. S. Davis, B. H. Holt, both of Kirby; N. Maphis of Rio; E. L. Blan of Rock Oak.

The North Salem Telephone Company, North Salem, N. Y. Capital stock, \$500. Incorporators: H. Hobart Keeler, Earle C. Bacon, Alfred Howe and David P. Vail.

The Decatur County Telephone Company, Greensburg, Ind. Capital stock \$30,000. Incorporators: J. Shanks, M. Spilman, J. G. Dormill, W. E. Jackson, J. S. Shaw, all of Greensburg.

The Menden Centre Telephone Company — to operate in Menden Centre, Rochester unction and Honeoye Falls, N.Y. Capital stock \$900. Incorporators: Edward P. White, B. H. Cole and Albert A. Lord, Menden Centre.

The Houston County Telephone Company. Houston County, Tenn. Capital stock, \$2,500. Incorporators: J. M. Cooley, J. W. Broadus, W. R. Boon, W.W. Patterson and H. N. Dunbar.

The Co-operative Telephone Company, Coldwater, O. Capital stock, \$2,000. Incorporators: C. F. Morvilus, J. B. Haslinger, J. M. Willhoff, A. Rathweg, P. F. Wearner.

The Kent Home Telephone Company, Kent, O. Capital stock, \$50,000. Incorporators: M. Kent, J. G. Getz, F. L. Allen, G. E. Hinds, W. H. Rutler.

#### GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Bay City, Mich.—This city will soon increase the capacity of its electric light plant.

Bridgepore, W. Va.—The Wheeling Electric Light Company of Wheeling, W. Va., has purchased and will rebuild the Bridgeport electric light plant.

Brookhaven, Miss. — This city will spend \$10,000 in improving the water and electric light plants.

Brown's Valley, Minn.-This village recently voted bonds for an electric light plant and waterworks

Cnattanooga, Teun. — The Cnattanooga Light & Power Company will repair that part of 11s plant recently damaged by fire. D J O'Conneil, manager.

Dickson, Tenn. — An election will be held here on a proposition to vote \$25,000 for an electric light and waterworks plant.

Florence, Col.—The Dorcas Mining and Milling Company will install a complete electric light and power plant in its new mill here. The plant will be completed by the middle of Soptember.

Hillsboro, Tex. - On July 24 the voters will determine whether the city is to erect an electric light plant. Holyoke, Mass.-Municipal ownership of the electric

light plant is being considered by the people here.

Indianapolis, Ind.—The Princeton Light & Power Company has increased its capital stock to \$75,000, and the plant will be enlarged and improved.

Lake Olessa, Mich - The village trustees are considering the advisability of obtaining an electric light

Los Angeles, Cal.—The city trustees have published advertisements calling for bids for furnishing the city with an electric light plant, the engine and other machinery to be capable of developing 500 horse power. The bids will be opened July 17.

Lowell, Mich. — At a recent meeting of the stock-holders of the Lowell Water & Light Company, funds were voted for making improvements to the electric piant.

Lyons, Mich. - The Lyons electric light plant has proven too small and the village board wants to build a new plant where more water power can be obtained.

Marion, Ind.—Contracts have been let by the administration of the Suidiers' Home for an electric light plant.

Marshfield, Ore.—The town board is taking steps to put in an electric light plant to be owned by the public.

Mattoon, I.l.—The electric light committee contemplaces the purchase of a 100-light dynamo.

McGregor, Tex.—Walker H. Freeman of this place will put up an electric light plant in the near future.

Newark, N. J -Newark's Free Library trustees will put an electric light plant in the new Library Building, in Washington street, at the head of Washington Park.

New York City.—The purchase of the Edison Electric I. unminsting Company and the Jamaics Electric Ii.ght Company by the New York and Qieens Gas & Electric Company was announced on the 28.n ult.

Niles, O.—Ine Niles Electric Company's lighting plant was lately sold at puolic auction by William T. Hariburt, receiver, to E. A. Wilson for \$7,500.

Ocion, Id.—R. J. Fullerton, T. Holland and C. A. Aspluad have been appointed a special committee to secure estimates, plans, etc., for erecting the proposed municipal electric lighting plant.

Philadelphia, Pa.—In all probability the Hammonton Water Company will make application at the next meeting of the council for an electric light franchise.

Ponca, Neb —It is expected that this place will have

electric lights before the summer is over

Richmond, Ltd. — W. W. Zimmerman, mayor, announces that bids will now be received for plans for an electric light plant to cost about \$100,000.

Saginaw, Mich.—The common council has recently approved the city engineer's plans for a municipal lighting plant and authorized the advertising of bids for the construction of the same at an estimated cost of \$71,820.

Springfield, Ky.-An electric light plant will soon be erected at this place, the necessary funds for that purpose having been subscribed.

Springfield, Mo.-O. Ford and B. M. Shaw, of St. Louis, contemplate the erection of an electric light plant here.

Suffield, Conn.—The Suffield Electric Light Company sameia, conn.—In a sumeid Electric Light Company lately voted to put in meters for their patrons. The officers decided that this is the only fair way, as each consumer will then pay for what he uses.

Valisburg, N. J. — The lighting committee will soon ask for bids for lighting this town.

Vanceburg, Ky. — J W. Mathewson and E. A. Dodge are interested in a new company formed here known as the Vanceburg Electric Light & Power Company.

Wilbraham, Mass.—Rich Hall at Wesleyan Academy is to be renovated this vacation and improvements will be made which will include a new electrical lighting

#### STREET RAILWAYS.

Albert Lea, Minn.—The Albert Lea & Geneva Bailway Company is being organized here to build an electric line from this city to the village of Geneva, a distance of about sixteen miles, and passing through a rich farming

Asheville, N. C.—The Asheville Street Railway Company is considering the extension of its electric line to Biltmore.

Augusta, Me.—The Gardiner & South Gardiner Electric Railway Company has filed with the Railroad Commission a petition for location. It is proposed to connect the city of Gardiner with the village of South Gardiner. The road will form one of the connecting links in the projected system of electric roads between this city and Portland.

Bowling Green, O—A. M. Jordan will confer with the citizers in regard to a line which he proposes building from Oak Harbor to Napoleon. The proposed line passes through this city, Pemberville, Weston and Grand Rapids.

Boyertown, Pa.—Engineers have surveyed the route of the proposed troiley line between this place and Reading. The fact that Samuel A. Bigg went over the route has led to the belief that the Reading Traction Company is interested in the line.

Bristol, Tenn—The Bristol Belt Line Railway Company has secured a franchise to build its proposed electric line G. I. Carter is interested.

Caldwell, N. Y.—It is stated that the proposed trolley road between here and Warrensburg will be under course of construction this month.

Chattanooga, Tenn.—The Chattanooga Electric Railway Company contemplates a number of improvements in its system.

ments in its system.

Columbus, O.—A consolidation of northern Ohio electric railway interests was recorded in the effice of the Secretary of State lately, the Cleveland, Elyria and Western Bailway Company being formed by the consolidation of the Cleveland, Beres, Elyria and Oberlin Railway Company, the Lorain County Railway Company, and Oberlin and Wellington Railway Company. The capital stock of the combined company is fixed at \$2,000,000.

Elyten Md.—Philodolphia capitalists —'Il haild the

Elkton, Md.—Philadelphia capitalists will build the Cherry Hill, Elkton & Cheapeake City Electric Rail-way. The State has made an appropriation of \$58,000 may. Ine State has made an appropriation of \$58,000 towards constructing this road.

Flushing, Mich.—Business men and citizens are in favor of granting a franchise for an electric railroad through this village.

Ft. Wayne, Ind.—The county commissioners have granted a franchise for the electric road from New Haven to this city. Work is to be started within six months. C. W. Orr, W. S. O'Rourke and L. S. Mills are interested.

Ft. Worth, Tex. — Preliminary arrangements have been completed for the erection of the proposed electric railway between this city and Dallas. H. C. Edrington is interested.

Kansas City, Mo.—The stockholders of the Metropolitan Street Railway will hold a meeting on August 6 for the purpose of raising \$2,800,000 for the change of motive power from cable to electric, and for the construction of new lines and extensions of old ones recently authorized by the council. W. H. Holmes is precident. president.

Keene, N. H.—The stockholders of the Keene Electric Railway Company have lately voted to increase the capital stock from \$10,000 to \$80,000.

Mt. Vernon, N. Y.—Steps were taker last week by the New York, Westchester & Connecticut Traction Company to build trolley lines from West Farms to the Bronx, as far east as Bridgeport, Conn., fifty miles

New Haven, Conn.—It is stated officially that the plans have been made by the New Haven Railroad Company for the installation of the suburban electric service in connection with the Union station at Boston. third-rail system of an entirely new

Niles, O.—Elmer Wilson, who with Cleveland parties recently bought out the Niles Electric Light Company, has obtained the right of way for a street railway line from here to the famous Salt Springs, where Philadelphia parties intend building a hotel.

Oakland, Cal.—The application of W. G Henshaw and A. S. Macdonald of this city, for an electric railroad franchise from the line between Alameda and Contra Costa Counties to Point Richmond was discussed by the board of supervisors recently, and it was decided to advertise for bids for the proposed franchise.

Palmer, Mass.—The plans for an electric road from here to Indian Orchard are assuming definite form, and steps are being taken to carry them out.

Stamford, Conn —The application made to the Stamford council for the extension of the trolley line to the Greenwich line has been granted.

Wabash, Ind.—There are encouraging prospects for the construction of an electric interurban line between here and Huatington, this year. F. C. Boyd is the promoter.

West Point, Miss.-T. C. Kimbrough, secretary of the board of trade, is in receipt of a letter from Eastern capitalists wanting to build an electric car line connecting this place and Columbus.

#### MANUFACTURING.

Syracuse, N. Y.-The Myers Break Finder Company of this city was recently incorporated to manufac-ture electrical appliances. The capital stock is \$100,000, and the directors are: Matthew J. Myers, M. Jarvis Myers, Augustus C. Stevens, Francis Myers and John F. Nash, all of Syracuse.

Utica, N. Y.—The Utica Fixture Company is a new concern formed here to manufacture gas and electric light fixtures with a capital of \$12,000. E J Milspaugh, A C. Sieboth and Joseph Rudd of Utica are all interested.

Washington, D. C.—The Cahill Writing Machine Manufacturing Company, which has for years employed a large force of workmen in perfecting its electrical typewriters, is increasing its plant. It is importing additional machinery and workmen to advance the manufacture of its machines.

#### COMPANY MATTERS.

Fairmont, W. Va.—The Fairmont Electric Light Company and the Fairmont Street Railway recently merged into one company. The officers are: President, B. K. McMechen of Wheeling; S. L. Watson, Fairmont, vice-president; J. M. Bailey, John A. Howard, Jere A. Miller, L. C. and C. Powell are the directors.

New York City.—At a meeting of the executive committee of the Manhattan Elevated Railway Company last week, the contract was awarded for the mason work on the company's central electrical power house at 74th street and the East River to M Reed & Co. The amount of the contract is about \$500,000.

Niagara Fall, N. Y. — The Ampere Electro Chemical Company recently leased the old plant of the Union Carbide Company and will soon begin operations in

Pitteburg, Pa.—The American Electrical Works of Providence, B. I., has a contract to supply the Consolidated Traction Company of this place with 42 miles of weather-proof feed cable. The contract amounts to more than 869,000 pounds, and involves a cost of \$100,000

Wilmington, Del.—The adjourned annual meeting of the stockholders of the Wilmington and Newcastle Electric Bailway Company will be held July 9.

York, Pa.—The consolidation of all the electric light and atreet railway companies of this city, under the title of the York County Traction Company, has recently been effected.

#### POWER AND TRANSMISSION PLANTS.

Salt Lake City. Utah. — If the present plans are approved, the Bio Grande Western may build an electric power plant here to furnish power and light to the shop and station buildings and yards.

warwick, Pa.—A syndicate of Philadelphians has purchased the Falls of the French Creek, in Chester County for \$35,000. The object of the new owners is to convert power from the waterfall into electricity, and transmit water and electricity to the towns and villages in that locality. The electricity will be used for supplying heat, light and power to patrons at a distance. Contracts have been secured in Pottstown and Phonixville, and it is expected that business can be done in Norristown. be done in Norristown.

#### MINES.

Cripple Creek, Col.—The Rio Grande sampler will install new machinery soon, including a twenty-five horse-power electric motor, which will give a total capacity of 500 tons per day.—The Gold Coin mine in Poverty Gulch is installing a new electric plant on the heavier hoist.

#### AUTOMOBILES.

Buffalo. N. Y.—A local company was lately organized here with a capital stock of \$600,000, and will start at once to manufacture automobiles. Herbert P. Bissell. William J. Knowles, Charles G Shepard, James A. Roberts, Hiram C. Martin, John J. Gibson and George C. Riley are those interested.

Ft. Dodge, Is.—The business people of this place are rejoicing over the prospect of securing the location of an automobile factory, which will be capitalized at a large figure, and will employ from three to five hundred skilled mechanics. New York capitalists are interested in the matter.

New Orleans, La — Mayor Capdevielle lately received a letter from W. K. Freeman, asking if a site was available in this city for the erection of an automobile factory. He desired he said, to build one that would give employment to 500 hands.

Portland, Me.—The Massachusetts Electric Cab Company is a newly-formed concern in this city with a capitalization of \$470,000, to deal in automobiles. Among those interested are D. H. Jones, J. H. Colby, both of Boston, Mass., and R. Webb of Portland.

St. Louis, Mo.—An automobile company, with head-quarters in New York, is arranging through its repre-sentative, Charles Decker, to piece 500 horseless vehi-cles on the streets of this city. The capacity of these vehicles will be 30 passengers. The cost is estimated at \$2,000 each.

#### ECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources The support are is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem if a favor to have brought to their attention any inaccuracies readers may discover in these columns.

#### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16;@16;c.; Lake, 16;@16;c.; casting, 16@16;c.

Books of the Pittsburg Consolidate 1 Traction Co. closed June 30 for dividend purposes; they will be opened July 15.

The New York, Westchester and Connecticut Traction Company has filed a mortgage for \$2.540,000 for construction purposes.

A mortgage for \$7,000,000, covering all property of the Welsbach Light Company, has been recorded to secure the new issue of bon s.

Boston capitalists have secured franchises for five street railways in Terre Haute, Ind., and have incorporated a company with \$50,000 capital.

A dividend of 1 per cent will be paid on the stock of the Consolidated Traction Company of New Jersey on July 16. Books closed June 3) and reopen July 17,

The Telephone, Telegraph & Cable Company of America has called an assessment of \$2 50 a share, payable July 30. Books close July 25 and reopen August 2.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 11(2,13; New York Electric Vehicle Transportation, 6(3,6); New England Transportation, 3(3,3); Gramophone, 35(4,4).

Gao. W. Stern, of New York, claiming to own 500 shares of Pittsburg Consolidated Traction Company stock, has brought two suits in an effort to prevent the proposed lease to the United Traction Company authorized by special vote of stockholders.

The Central Electric Company of New Jersey has obtained control of the electric light companies of New Brunswicz, Porth Amboy, Rahway, Metuchen and Brund Brook, and will operate them under one management. The company is capitalized at \$100,000.

The Boston "News Bureau" says: We understand that the Massachusetts Electric Companies is making a very good showing of earnings and that it will shortly issue a statement which will show about a 14 per cent increase in gross earnings and but a 3 per cent, increase in expenses for a series of months.

The Chicago Union Traction Company has declared a dividend of 1½ per cent, on its preferred stock, payable July 2). Books closed June 3) and reopen July 25. An authority says that earnings for the first week of June decreased at the rate of from \$1,000 to \$1,500 per day. During last week the loss was about \$400 per day.

The directors of the Electric Vehicle Company met and took no action on the dividend. The company is not likely to pay dividends in the immediate luture. Two new directors have been elected, Colonel Albert A. Pope and Herbert Lioyd. Mr. L'oyt is the vice-president and general manager of the Electric S.orage Battery Company.

It is stated that Wilson and S evens of New York, representing the New York and Queens Gas and Electric Company, have purchased the Long I land City & Jamaica Company, controlling the Elison Electric Lluminating Company of Long Island City and the Jamaica Electric Light Company. The Elison Company is capitalized at \$500,000, with \$500,000 bonds, and the Jamaica Company at \$200,000, with \$100,000 bonds.

The matter of equipment of the elevated lines of the Boston Elevated Railway Company has been definitely settled. The contract for the multiple unit system will go to the Sprague Electric Company and the contract for the motors will go to the Westinghouse Electric Company. The contracts cover the equipment of 60 cars and involves the expenditure of about \$100,000 and \$200,000 respectively. The contracts for the car bodies, trucks and air brakes have not been placed as yet.

Directors of the United Power & Transportation Company of Philadelphia have declared a semi-annual dividend of 50 cents per share; in addition, 16 cents was declared on the second installment. This is at the same rate on the \$20 paid in as the 50 cents declared last December on the \$10 per share then paid in on the stock, the 16 cents representing the proportional dividend since the payment on the second call.

The General Electric Company and the Thomson-Houston Company have entered three suits against the Boston Elevated Railway Company in the United States Circuit Court, alleging infringement of patents in connection with motor controllers now generally in use on the defendant company's cars. While the Boston Elevated Company is made the defendant in the suits, the real parties concerned are the General Electric Company and the Sprague Electric Company, makers of the controllers.

Application for the appointment of a receiver for the Chicago Consolidated Traction Company has been made in the Circuit Court by Sutro Bros. & Company of New York, bankers and stockholders. Stockholders in the Consolidated Traction Company have objected to the control of the corporation by the Union Traction Company, which was practically brought about several months ago by the transfer of the stock of the Consolidated Company for morigage bonds of the Union Traction Company, and for this reason the appointment of a receiver is urged.

Judge Lacombe, in the United States Circuit Court, on June 29, appointed William Jay receiver of the Forty-second street, Manhattanville & St. Nicholas Avenue Railroad Company to succeed Hugh J Grant, who resigned. Mr. Jay's bond is fixed at \$100,000 In his petition, Mr. Grant calls attention to the fact that the interest of the stockholders demand that the Forty second Street road shall be operated in conjunction with the Third Avenue Railroad. This indicates that the receivership of the Forty-second Street road will be prolonged. It was thought that the receivership would terminate shortly after the termination of the receivership of the Third Avenue Railroad.

or the Third Avenue Railroad.

The Philadelphia "Stockholder" says: "Friends of Philadelphia Electric and Electric Company of America stocks assert that present prices will look remarkably cheap a few weeks hence. Both companies are reported to be doing a very heavy businesse. As regards Philadelphia Electric, it is stated that earnings are running at a rate which not only eliminates the necessity for a call on the stock, but warrants payment of a dividend before long. Coincidental with action of this character there would naturally be heavy buying of the stock and as a consequence higher prices would doubtless prevail. According to semi-official authority, the Long Island plant of the Electric Company of America has been sold and the purchase money turned over."

A consolidation of all the electric light and street million.

A consolidation of all the electric light and street railway companies in the city of York, Pa., under the title of the York County Traction Company, has been effected. The concerns included in this combination are the York Street Ediway Company, Edison Electric Light Company, York Steam Heating Company, York Light, Heat & Power Company, Westinghouse Leght, Heat & Power Company, York & Dallastown Electric Railway Company, York & Manchester Electric Railway Company and the York & Wrightsville Electric Railway Company. Edward C. Jones & Co, bankers, of New York & Ponladelphia, have purchased from the new corporation an issue of \$1,500,000 of fifty-year 5 per cent. gold bonds. Of the proceeds of this sale \$1,000,000 will be used for the acquisition of part of the above-mentioned properties and for extensions, the balance being retained for future improvements and betterments.

#### DEPARTMENT OF THE INTERIOR, WASHINGTON. DEAR SIR: I have received yours of Nov. 29, and have in reply to state that your resignation as Principal Examiner in charge of electricity in the United States Patent Office took effect on April 1, 1887. You were for three years the Electrical Expert in charge of the class of electricity in that office. From the best of my knowledge and belief you were competent to pass fully and intelligently upon all matters requiring electrical expert knowledge concerning inventions, etc. Your reputation in this respect was high, not only in the Department, but outside. I wish you success in your new business. With kind feeling, I have the December 2d, 1887. With kind feeling, I have the honor to remain, DR. I. KITSEE, Very truly yours, ANALYTICAL CHÉMIST, L. Q. C. LAMAR. (Graduate Vienna) Sec'y Interior. ELECTRICAL EXPERT. No. 806 STOCK EXCHANGE PLACE. Mr. CHAS. J. KINTNER, 265 Broadway, Philadelphia, May 20, 1896. New York City. CHAS. J. KINTNEB, Esq., 45 Broadway, N. Y. Dear Sir:-Your favor dated 18th inst., with enclosed notice of allowance and copy of claims as allowed received. It gives me great pleasure to be able to acknowledge not only the conscientiousness of your work, but also the great ingenuity displayed in the wording of the claims. In about two or three weeks I will be able to notify you in what foreign countries. patents should be applied for. Till then I beg to remain, yours very truly, Dr. I. KITSEE. CHAS. J. KINTNER, Solicitor of Domestic and Foreign Patents, 45 Broadway, New York.

#### CONTENTS.

Introductory—Generators—Generators, Concluded—Induction Motors—Synchronous Motors—Rotary Converters—Static Transformers—Station Equipment and General Apparatus—Two phase System—Three-phase System—Monocylic System—Frequency—Relative Weights of Copper—Calculation of Transmission Line.

#### PARTIAL LIST OF DIAGRAMS.

- The connections of a three-phase generator with composite field windings
  - Shows the connections and station instruments required for the process of throwing generators in parallel, and operating them continuously, as used extensively in this country.

    Temporary transformers connected to a different phase of the cir-

cuit than that in which are the permanent lamps.

Arrangement of generators at 500-KW. capacity and above, with bed-plate shaft and two bearings, designed for water-wheel connection.

42. Generator for direct connection to engine without bed-plate, shaft or bearings.

- Connections of a two-phase motor and starting device.

  The connections of a starting device arranged to give a number of different conditions of starting-voltages to suit the conditions of
- The connections of a starting compensator for a three-phase motor. The connections of a three-phase motor and of a rheostatic controller for variable speeds.

  The condensers and connection of a two-phase motor.

The connections of a self-starting, single-phase motor. Single-phase arrangement of connections. Connections for three-phase rotary converters.

- Usual method of making connections for a two-phase rotary con-
- " verter. 74.
- The connections of a four-pole single-phase rotary.

  A three-phase arrangement of six collector rings.

  The installation and connections of air-blast transformers in a long-
- "
- distance power transmission.

  Diagrammatical illustration of the apparatus and connections of one of the standard forms of a three-phase generator panel.

  The connections in a generating station of a large power transmission plant, consisting of four 1,000-HP. generator units, one of which is held as a spare.

  Diagrammatic illustration of the connections and instruments in the generator station and sub-etation of a two unit transmissions.
- the generating station and sub-station of a two-unit transmission plant.
- 102. The connections and method of installing an arrester for 10,000volt circuits. 107.
- The arrangement and connections of one form of regulator for

- varying the pressure of an alternating current circuit.
  Connections of a 2,000-volt generator.
  Connections commonly used for lighting and transmission of power.
  Transformer connections for changing two-phase to three-phase and " 121. back again.
- Connection of both primary and secondary terminals of transformers having a ratio 10 to 1.

  Three transformers Y connected in both windings.

  A combination  $\triangle$  and Y connections.

  Primary transformers are connected Y, the secondaries  $\triangle$ . 125.

- The  $\triangle$  connection is sometimes made up of two transformers instead of three. 129.
- 130. Motors connected to the secondaries of three transformers in a
- three-phase system.
  Connections of three transformers for a low tension distribution system, by the three-phase four-wire system.
  Connections of three-phase recording wattmeters for low and for 133-4
- high voltage circuits.

  Method of installing and connections for a wattmeter transformer.

  Connections and detail of the monocyclic generator armature.

  6. Various methods in detail of connecting transformers to monocyclic circuits and the resultant voltages
- A third method of obtaining the proper phase relationship for motor
- A recording wattmeter connected to measure the power delivered

The Readers
We have—
We hold!

This is an age of education. No other nation on the face of the globe is so intelligent as ours, and intelligence makes a nation prosperous and happy. Education gives a young man the best chance in life. The easiest and cheapest way to educate yourself and your children, irrespective of the schools and colleges, is by having the best current reading in your house.

THE GREATEST FAMILY NEWSPAPER IS

### Leslie's Illustrated Weekly.

It tells the story of contemporaneous events and illustrates it with the most artistic pictures. He who reads it every week learns to recognize the counte-

nances of the noblest men and women in public and in private life; the appearance of the world's most famous places, and the scenes of the greatest historic interest.

LESLIE'S WEEKLY is a paper to keep on the library table, and to read and reread, and to file away for useful reference. It is read by more families of culture and refinement among the masses than any other paper of its class in the world. It is the greatest, best, most attractive and cheapest of all American educators.

It is for sale everywhere—on the stands, in the bookstores, on all trains, at 10 cents per copy.

LESLIE'S WEEKLY, 110 Fifth Avenue, New York.

### GRAPHITE RESISTANCE.

Graphite resistance in rods, tubes or otherwise. Any resistance wanted—one ohm to one million ohms. Write for particulars IOS. DIXON CRUCIBLE CO., Jersey City, N. ]

### FERRO-NICKEL MANGANESE

is adopted by four National Governments, twenty-eight Railroad Companies, and meet ll up to date progressive foundries in Europe as well as in the United States. Several Arsenals have given Ferro-Nickel Manganese a hearty endorsement because it is manufactured entirely on scientific principles and claimed to be ABSOLUTELY THE BEST FLUX for fluidity and the foremost in the market for giving purity, duetility and softness to the metal. Price 10 cents per pound, U.S. currency.

Beware of imitations or alloys sold at double or triple their price. Apply for directions, catalogue and testimonials to

#### DEPARTMENT OF THE INTERIOR, COPY. WASHINGTON. DEAR SIR: December 2d, 1887. I have received yours of Nov. 29, and have in reply to state that your resignation as Principal Examiner in charge of electricity in the United States Patent

of charge of electricity in the United States Patent Office took effect on April 1, 1887. You were for three years the Electrical Expert in charge of the class of electricity in that office. From the best of my knowledge and belief you were competent to pass fully and intelligently upon all matters requiring electrical expert knowledge concerning inventions, etc. Your reputation in this respect was high, not only in the Department, but outside. I wish you success in your new business.

With bind faciling, I have the

With kind feeling, I have the honor to remain,

Sec'y Interior.

New York City.

Mr. Chas. J. Kintner, 265 Broadway,

DR. I. KITSEE, Very truly yours, L. Q. C. LAMAR,

ANALYTICAL CHÉMIST, (Graduate Vienna) ELECTRICAL EXPERT,

NO. 306 STOCK EXCHANGE PLACE.

Philadelphia, May 20, 1896. CHAS. J. KINTNER, Esq., 45 Broadway, N. Y.

Dear Sir:-Your favor dated 18th inst., with enclosed notice of allowance and copy of claims as allowed received. It gives me great pleasure to be able to acknowledge not only the con-scientiousness of your work, but also the great ingenuity displayed in the wording of the claims. In about two or three weeks I will be able to notify you in what foreign countries patents should be applied for.

Till then I beg to remain, yours very truly, DR. I. KITSEE,

CHAS. J. KINTNER, Solicitor of Domestic and Foreign Patents, 45 Broadway, New York.

### THE PAN AMERICAN MAGAZINE,

A Pictorial and Literary History and Periodical record of the

PAN AMERICAN EXPOSITION, to be held on the Niagara Frontier in 1901. THE original EXPOSITION JOURNAL.

Best advertising medium for Exposition business.

Address for particulars and samples
PAN AMERICAN MAGAZINE,

532-534 Ellicott\_Sq., Buffalo, N Y.

The Readers
We have—
We hold!

This is an age of education. No other nation on the face of the globe is so intelligent as ours, and intelligence makes a nation prosperous and happy. Education gives a young man the best chance in life. The easiest and cheapest way to educate yourself and your children, irrespective of the schools and colleges, is by having the best current reading in your house.

THE GREATEST FAMILY NEWSPAPER IS

### Leslie's Illustrated Weekly.

It tells the story of contemporaneous events and illustrates it with the most artistic pictures. He who reads it every week learns to recognize the countenances of the noblest men and women in public and

in private life; the appearance of the world's most famous places, and the scenes of the greatest historic interest.

LESLIE'S WEEKLY is a paper to keep on the library table, and to read and reread, and to file away for useful reference. It is read by more families of culture and refinement among the masses than any other paper of its class in the world. It is the greatest, best, most attractive and cheapest of all American educators.

It is for sale everywhere—on the stands, in the bookstores, on all trains, at 10 cents per copy.

LESLIE'S WEEKLY, 110 Fifth Avenue, New York.

### GRAPHITE RESISTANCE

Graphite resistance in rods, tubes or otherwise. Any resistance wanted—one ohm to one million ohms. Write for particulars JOS. DIXON CRUCIBLE CO., Jorsey City, N. J.

### FERRO-NICKEL MANGANESE

is adopted by four National Governments, twenty-eight Railroad Companies, and most ll up to date progressive foundries in Europe as well as in the United States. Several Arsenals have given Ferro-Nickel Manganese a hearty endorsement because it is manufactured entirely on scientific principles and claimed to be ABSOLUTELY THE BEST FLUX for fluidity and the foremost in the market for giving purity, ductility and softness to the metal. Price 10 cents per pound, U.S. currency.

Beware of imitations or alloys sold at double or triple their price. Apply for directions, catalogue and testimonials to

DEPARTMENT OF THE INTERIOR, WASHINGTON.

December 2d, 1887. I have received yours of Nov. 29, and have in reply to state that your resignation as Principal Examiner in charge of electricity in the United States Patent

In charge of electricity in the United States Patent Office took effect on April 1, 1887. You were for three years the Electrical Expert in charge of the class of electricity in that office. From the best of my knowledge and belief you were competent to pass fully and intelligently upon all matters requiring electrical expert knowledge concerning inventions, etc. Your reputation in this respect was high, not only in the Department, but outside. I wish you success in your new business.

With hind feeling I have the

With kind feeling, I have the honor to remain,

Very truly yours,

L. Q. C. LAMAR,

Mr. CHAS. J. KINTNER 265 Broadway,

Sec'y Interior.

New York City.

DR. I. KITSEE, ANALYTICAL CHÉMIST,

The Readers We have-We hold!

This is an age of education. No other nation on the face of the globe is so intelligent as ours, and intelligence makes a nation prosperous and happy. Education gives a young man the best chance in life. The easiest and cheapest way to educate yourself and your children, irrespective of the schools and colleges, is by having the best current reading in your house.

THE GREATEST FAMILY NEWSPAPER IS

### Leslie's Illustrated Weekly.

It tells the story of contemporaneous events and illustrates it with the most artistic pictures. He who reads it every week learns to recognize the counte-

nances of the noblest men and women in public and in private life; the appearance of the world's most famous places, and the scenes of the greatest historic interest.

LESLIE'S WEEKLY is a paper to keep on the library table, and to read and reread, and to file away for useful reference. It is read by more families of culture and refinement among the masses than any other paper of its class in the world. It is the greatest, best, most attractive and cheapest of all American educators.

It is for sale everywhere—on the stands, in the bookstores, on all trains, at 10 cents per copy.

LESLIE'S WEEKLY, 110 Fifth Avenue, New York.

### CAPITAL PROCURED INVENTORS

to develop and perfect meritorious inventions or ideas, and funds provided to place good patents on the English and American markets.

The sale of approved patents also undertaken. Companies organized.

R. RUXTON, 195 La Salle Street, Chicago, Ill.

### FERRO-NICKEL MANGANESE

is adopted by four National Governments, twenty-eight Railroad Companies, as ll up to date progressive foundries in Europe as well as in the United States. Several Arsenals have given Ferro-Nickel Manganese a hearty endorsement because it is man factured entirely on scientific principles and claimed to be ABSOLUTELY THE BEST FLUX for fluidity and the foremost in the market for giving purity, ductility and selfness to the metal. Price 10 cents per pound, U.S. currency.

Beware of imitations or alloys sold at double or triple their price. Apply for directions, catalogue and testimonials to

### STANDARD WIRING For Electric Light and Power.

By H. C. CUSHING, JR., A. I. E. E., Electrical Engineer and Inspector.

The Universally Adopted National Electrical Code explained and illustrated in this handbook.

ADOPTED by the Fire Underwriters of the United States, by Cornell University, Stanford University and other technical colleges and schools, by over 27,000 Electrical Engineers, Central Station Managers and Wiremen—

BECAUSE it is the only book on Wiring and Construction kept strictly up-to-date. It contains all the necessary Tables, Rules, Formulæ and illustrations. It settles disputes, and if referred to before wiring will prevent disputes.

BRANCHES-New York, Boston, San Francisco, Philadelphia, Chicago, City of Mexico.

DEPARTMENT OF THE INTERIOR, COPY. WASHINGTON. DEAR SIR: December 2d, 1887.

I have received yours of Nov. 29, and have in reply to state that your resignation as Principal Examiner in charge of electricity in the United States Patent Office took effect on April 1, 1887. You were for three years the Electrical Expert in charge of the class of electricity in that office. From the best of my knowledge and belief you were competent to pass fully and intelligently upon all matters requiring electrical expert knowledge concerning inventions, etc. Your reputation in this respect was high, not only in the Department, but outside. I wish you success in

your new business,

With kind feeling, I have the honor to remain,

Sec'y Interior.

New York City.

Mr. CHAS. J. KINTNER, 265 Broadway,

DR. I. KITSEE, Very truly yours, ANALYTICAL CHEMIST, L. Q. C. LAMAR,

(Graduate Vienna) ELECTRICAL EXPERT,

Philadelphia, May 20, 1896.

No. 306 STOCK EXCHANGE PLACE.

CHAS. J. KINTNER, Esq., 45 Broadway, N. Y. Dear Sir:-Your favor dated 18th inst., with enclosed notice of allowance and copy of claims as allowed received. It gives me great pleasure to be able to acknowledge not only the conscientiousness of your work, but also the great ingenuity displayed in the wording of the claims. In about two or three weeks I will

be able to notify you in what foreign countries. patents should be applied for. Till then I beg to remain, yours very truly, DR. I. KITSEE,

CHAS. J. KINTNER, Solicitor of Domestic and Foreign Patents, 45 Broadway, New York.

### The Readers We have-We hold i

This is an age of education. No other nation on the face of the globe is so intelligent as ours, and intelligence makes a nation prosperous and happy. Education gives a young man the best chance in life. The easiest and cheapest way to educate yourself and your children, irrespective of the schools and colleges, is by having the best current reading in your house.

THE GREATEST FAMILY NEWSPAPER IS

### Leslie's Illustrated Weekly.

It tells the story of contemporaneous events and illustrates it with the most artistic pictures. He who reads it every week learns to recognize the counte-

nances of the noblest men and women in public and in private life; the appearance of the world's most famous places, and the scenes of the greatest historic

LESLIE'S WEEKLY is a paper to keep on the library table, and to read and reread, and to file away for useful reference. It is read by more families of culture and refinement among the masses than any other paper of its class in the world. It is the greatest, best, most attractive and cheapest of all American

It is for sale everywhere—on the stands, in the bookstores, on all trains, at 10 cents per copy.

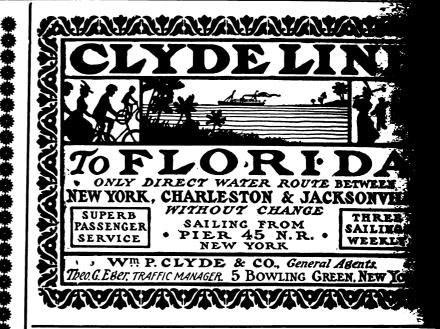

LESLIE'S WEEKLY, 110 Fifth Avenue, New York.

#### CAPITAL PROCURED INVENTORS

to develop and perfect meritorious inventions or ideas, and funds provided to place good patents on the English and American markets.

The sale of approved patents also undertaken. Companies organized.

## FERRO-NICKEL MANGANES

is adopted by four National Governments, twenty-eight Railroad Companies, and mos ll up to date progressive foundries in Europe as well as in the United States. Several Arsenals have given Ferre-Nickel Manganese a hearty endorsement because it is manufactured entirely on scientific principles and claimed to be ABSOLUTELY THE BEST FLUX for fluidity and the foremost in the market for giving purity, duetility and softness to the metal. Price 10 cents per pound, U.S. currency

Beware of imitations or alloys sold at double or triple their price. Apply for directions, catalogue and testimonials to

DEPARTMENT OF THE INTERIOR, WASHINGTON. December 2d, 1887. I have received yours of Nov. 29, and have in reply to state that your resignation as Principal Examiner

o state that your resignation as Principal Examiner in charge of electricity in the United States Patent Office took effect on April 1, 1887. You were for three years the Electrical Expert in charge of the class of electricity in that office. From the best of my knowledge and belief you were competent to pass fully and intelligently upon all matters requiring electrical expert knowledge concerning inventions, etc. Your reputation in this respect etc. Your reputation in this respect was high, not only in the Department, but outside. I wish you success in your new business,

With kind feeling, I have the honor to remain,

Very truly yours,

L. Q. C. LAMAR,

Sec'y Interior.

DR. I. KITSEE,

ANALYTICAL CHEMIST.

(Graduate Vienna)

ELECTRICAL EXPERT.

ELECTRICAL EXPERT,

No. 306 STOCK EXCHANGE PLACE.

Philadelphia, May 20, 1896.

CHAS. J. KINTNER, Esq.,

45 Broadway, N. Y.

Dear Sir:—Your favor dated 18th
inst., with enclosed notice of allowance and copy of claims as allowed received. It gives me great pleasure to be able to acknowledge not only the conscientiousness of your work, but also the great ingenuity displayed in the wording of the claims. In about two or three weeks I will be able to notify you in what foreign countries, patents should be applied for.

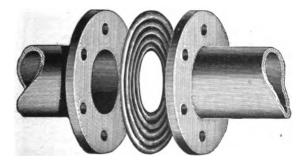

Till then I beg to remain, yours very truly,

DR. I. KITSEE.

CHAS. J. KINTNER, Solicitor of Domestic and Foreign
Patents, 45 Broadway, New York.

Introductory—Generators—Generators, Concluded—Induction Motors—Synchronous Motors—Rotary Converters—Static Transformers—Station Equipment and General Apparatus—Two phase System—Three-phase System—Monocylic System—Frequency—Relative Weights of Copper—Calculation of Transmission Line.

PARTIAL LIST OF DIAGRAMS.

Fig. The connections of a three-phase generator with composite field

windings.
Shows the connections and station instruments required for the process of throwing generators in parallel, and operating them continuously, as used extensively in this country.

Temporary transformers connected to a different phase of the cir-

38

cuit than that in which are the permanent lamps.

Arrangement of generators at 500-KW. capacity and above, with bed-plate shaft and two bearings, designed for water-wheel connection.

Generator for direct connection to engine without bed-plate, shaft-

or bearings.
Connections of a two-phase motor and starting device.

The connections of a starting device arranged to give a number of different conditions of starting-voltages to suit the conditions of

The connections of a starting compensator for a three-phase motor. The connections of a three-phase motor and of a rheostatic controller 66

for variable speeds.

The condensers and connection of a two-phase motor.
The connections of a self-starting, single-phase motor. 61.

Single-phase arrangement of connections. Connections for three-phase rotary converters.

Usual method of making connections for a two-phase rotary converter.

74. 75.

The connections of a four-pole single-phase rotary.

A three-phase arrangement of six collector rings.

The installation and connections of air-blast transformers in a long-

The installation and connections of air-clast transformers in a long-distance power transmission.

Diagrammatical illustration of the apparatus and connections of one of the standard forms of a three-phase generator panel.

The connections in a generating station of a large power transmission plant, consisting of four 1,000-HP. generator units, one of which is held as a spare.

Diagrammatic illustration of the connections and instruments in

99. the generating station and sub-station of a two-unit transmission plant

The connections and method of installing an arrester for 10,000-102 volt circuits.

The arrangement and connections of one form of regulator for

107.

varying the pressure of an alternating current circuit.
Connections of a 2,000-volt generator.
Connections commonly used for lighting and transmission of power.
Transformer connections for changing two-phase to three-phase and 115 121.

back again.

Connection of both primary and secondary terminals of transformers having a ratio 10 to 1.

Three transformers Y connected in both windings.

A combination \( \triangle \text{ and Y connected in both windings.} \)

Primary transformers are connected Y, the secondaries \( \triangle \text{.} \)

The \( \triangle \text{ connection is sometimes made up of two transformers instead of three.

Motors connected to the secondaries of three transformers in a 44 125.

127. 128.

Motors connected to the secondaries of three transformers in a three-phase system. Connections of three transformers for a low tension distribution

system, by the three-phase four-wire system. Connections of three-phase recording wattmeters for low and for 133-4

high voltage circuits.

Method of installing and connections for a wattmeter transformer.

Connections and detail of the monocyclic generator armature.

6. Various methods in detail of connecting transformers to monocyclic circuits and the resultant voltages.

A third method of obtaining the proper phase relationship for motor work.

A recording wattmeter connected to measure the power delivered . 148. to motors.

The Readers We have-We hold!

This is an age of education. No other nation on the face of the globe is so intelligent as ours, and intelligence makes a nation prosperous and happy. Education gives a young man the best chance in life. The easiest and cheapest way to educate yourself and your children, irrespective of the schools and colleges, is by having the best current reading in your house.

THE GREATEST FAMILY NEWSPAPER IS

### Leslie's Illustrated Weekly.

It tells the story of contemporaneous events and illustrates it with the most artistic pictures. He who reads it every week learns to recognize the counte-

nances of the noblest men and women in public and in private life; the appearance of the world's most famous places, and the scenes of the greatest historic interest.

LESLIE'S WEEKLY is a paper to keep on the library table, and to read and reread, and to file away for useful reference. It is read by more families of culture and refinement among the masses than any other paper of its class in the world. It is the greatest, best, most attractive and cheapest of all American educators.

It is for sale everywhere—on the stands, in the bookstores, on all trains, at 10 cents per copy.

FSLIE'S FEKIY

By H. C. Cushing, Jr., A. I. E. E., Electrical Engineer and Inspector.

ADOPTED

By the Fire Underwriters of the United States. By Cornell University, Stanford University and other Technical Colleges and Schools. By over 27,000 Electrical Engineers, Central Station Managers and Wiremen.

#### BECAUSE

It is the only book on Wiring and Construc-tion kept strictly up to date.

It contains all the necessary Tables, Rules, Formulas and Illustrations.

It settles disputes, and if referred to before wiring will prevent disputes.

Flexible Leather Cover (pocket size), \$1.

PARTIAL LIST OF DIAGRAMS.

The connections of a three-phase generator with composite field Fig.

The connections of a three-phase generator with composite field windings.

Shows the connections and station instruments required for the process of throwing generators in parallel, and operating them continuously, as used extensively in this country.

Temporary transformers connected to a different phase of the circuit than that in which are the permanent lamps.

Arrangement of generators at 500-KW, capacity and above, with bed-plate shaft and two bearings, designed for water-wheel connection.

Generator for direct connection to engine without bed-plate, shaft

Generator for direct connection to engine without bed-plate, shaft or bearings.

Connections of a two-phase motor and starting device.

The connections of a starting device arranged to give a number of different conditions of starting-voltages to suit the conditions of operation.

The connections of a starting compensator for a three-phase motor. The connections of a three-phase motor and of a rheostatic controller

for variable speeds.

The condensers and connection of a two-phase motor. The connections of a self-starting, single-phase motor. Single-phase arrangement of connections.

Connections for three-phase rotary converters.
Usual method of making connections for a two-phase rotary con-

Usual method of making connections for a two-phase rotary converter.

The connections of a four-pole single-phase rotary.

A three-phase arrangement of six collector rings.

The installation and connections of air-blast transformers in a long-distance power transmission.

Diagrammatical illustration of the apparatus and connections of one of the standard forms of a three-phase generator panel.

The connections in a generating station of a large power transmission plant, consisting of four 1,000-HP, generator units, one of which is held as a spare.

Diagrammatic illustration of the connections and instruments in the generating station and sub-station of a two-unit transmission plant.

The connections and method of installing an arrester for 10,000-volt circuits.

**4** 102 volt circuits.

**4 107.** 

The arrangement and connections of one form of regulator for varying the pressure of an alternating current circuit.

Connections of a 2,000-volt generator.

Connections commonly used for lighting and transmission of power.

Transformer connections for changing two-phase to three-phase and back again 115. 116. 121.

125.

126

127. 128, 129,

back again.

Connection of both primary and secondary terminals of transformers having a ratio 10 to 1.

Three transformers Y connected in both windings.

A combination \( \triangle \text{ and Y connections.} \)

Primary transformers are connected Y, the secondaries \( \triangle \text{.} \)

The \( \triangle \text{ connection is sometimes made up of two transformers instead of three. } \)

130.

Motors connected to the secondaries of three transformers in a three-phase system.

Connections of three transformers for a low tension distribution system, by the three-phase four-wire system.

Connections of three-phase recording wattmeters for low and for blob relative structure.

133-4

Method of installing and connections for a wattmeter transformer.

Connections and detail of the monocyclic generator armature.

Various methods in detail of connecting transformers to monocyclic circuits and the resultant voltages.

A third method of obtaining the proper phase relationship for motor

work. recording wattmeter connected to measure the power delivered to motors

# GREENFIELD FlexibleSteel Armored Conductors.

The Steel Armored Twin Conductors find special favor on account of the ease with which they can be installed, especially in finished buildings, for open construction and fished wiring on the loop system, in accordance with the requirements of Rule 24, Section "S," and Rule 48, Section "B," of the National Electrical Code.

The Steel Armored Flexible Cord for lamp pendants and portables is particularly desirable for use under all conditions requiring extraordinary service in such places as machine shops, theatres, mills, show windows, factories, etc., where flexible cords are almost indispensable and where ordinary "cord" is frequently useless.

These products represent the latest and most radical advance in the art of electric wiring. Their use reduces the installation of electric conductors to an absolute simplicity.

## No Elbows Required. Entire Flexibility

We will furnish cables and cords complete with armor, or we will armor conductors sent to us if insulated in accordance with the rules of the National Electrical Code.

The cordial reception accorded these new products is without doubt largely due to the high grade of insulation surrounding the conductors, the perfect mechanical protection afforded by the steel armor, and the lower first cost when compared with the metal conduits, plus conductors.

We offer to electrical contractors the greatest variety of conduits and appliances in the world. Send for Bulletin No. 02400.

Section of Flexible Steel Armored Cable.
